AN improved form of steering gear for motor-cars has recently been devised by Messrs. Rose and Catt, of Bournemouth. The gear is so arranged that any back thrust due to the wheel is directly borne by fixed parts close to the latter, the steering spindle and jointed connections being protected and are used only for the purpose of steering. Thus any looseness which may exist in the joints of the connections does not affect the security with which the wheels are held in the desired direction. The steering spindle is provided at the lower end with a bevel or other gear wheel, through which a connecting shaft is rotated to transmit the steering movement to the wheels. The shaft is made in several parts, the main portion consisting of two pieces, one of square section, telescoping into the other to enable the length to be adjusted, and both parts are connected by universal joints to the two end portions, which are mounted in suitable bearings carried respectively by the chassis and by a bracket on the fixed wheel shaft. The universal joints and the adjustment permit of free relative movement between the wheel shaft and the chassis. The steering end of the connecting shaft acts upon the usual steering arms directly operating the wheels, through screw or worm segment or other convenient form of gearing, thus placing the irreversible gear at the end most distant from the steering spindle. The inventors have fitted the arrangement to an old pattern 7-h.p. Daimler for purposes of demonstration.

## THE "MAYFAIR" CARS

**I**N our last issue we briefly referred to the new cars which are being introduced into this country by the Mayfair Motor Company, Ltd., of Shaftesbury Avenue, London, W.C., to meet the demand for vehicles of reliable construction and moderate price. The accompanying illustration depicts the chassis of the "Mayfair" 10-h.p. car, which has a pressed steel frame narrowed in front to increase the lock of the steering wheels. The motive power is supplied by a twin-cylinder engine, 98 mm. bore by 130 mm. stroke. The valves are all mechanically actuated off a single cam shaft; the water circulation is maintained by a pump and framed-ribbed radiator with air-inducing fan. The ignition is by coil and accumulators, but provision is made for a second form—high-tension magneto—if desired. This was applied to the car we examined, the one ignition lever on the steering wheel controlling both systems. The carburettor is of the latest type, an extra air inlet being provided in conjunction with it. Three speeds forward and a reverse are controlled by one lever. From the engine the power is transmitted through a leather-faced cone clutch to the gear-box, and thence by cardan shaft and bevel gear to a well-supported live axle. The usual hand and foot-operated brakes are available, those working on drums connected with the rear road wheels being of the internal expanding type. The speed of the engine is controlled either by a lever on the steering wheel or by a small pedal. The lubrication of the engine is maintained by a compact mechanically-actuated pump. The chassis

Chassis of "Mayfair" 10-h.p. Car.

has a wheel base of 8 ft. 7 in. and a track of 4 ft. 2 in., while, with a view of rendering it easy riding, the usual longitudinal springs are supplemented by a transverse one at the rear. Any form of carriage body can, of course, be fitted.

The Mayfair Company are also supplying two sizes of four-cylinder cars—15-h.p. and 28-h.p.; the latter is made with either side chain drive or a live axle, while the 15-h.p. vehicle, on the other hand, is only built in the chainless form. The cylinders, which are cast in pairs, are 85 mm. bore by 110 mm. stroke in the case of the 15-h.p., and 110 mm. by 130 mm. for the 28-h.p.

The general details are similar to those of the 10-h.p. car above described, except that the lubrication is maintained by the pressure of the exhaust. A somewhat new departure on the 15-h.p. car is the provision of a pedal by means of which the ignition can be advanced independently of the hand control on the steering wheel. Reference may finally be made to the Mayfair 6-h.p. two-seater. The little car, which has a smart appearance, is fitted with a De Dion engine, water-cooled on the thermo-syphon system, no pump being employed. The transmission is by a cardan shaft and bevel gear on to a live axle. The speed of the motor is controlled by a small pedal actuating a throttle on the inlet; the latter is also connected up with the clutch pedal in such a way that as the clutch is withdrawn the speed of the engine is automatically cut down.

## CONTINENTAL NOTES.

## The Association Generale Automobile.

From the Association Generale Automobile of Paris we have received a copy of the road-book it has lately issued, in which particulars are given of recommended hotels, garages, and motor repairers in France. The Association is under the patronage of the Automobile Club of France, and is practically the French equivalent of the Motor Union of Great Britain and Ireland. Identification cards and badges are forwarded to members as soon as they are admitted, and they receive each month a copy of the official organ, containing communications from the A.C.F. and affiliated clubs, articles on technical and legal matters, descriptions of new inventions, touring notes, &c.

## An Italian Voiturette Race.

A voiturette race was held over a 247 kilometre course in Sicily on the 6th inst. The contest was restricted to cars of not more than 10-h.p. There were thirteen competitors, the winner being the Chevalier V. Florio, who, on an 8-10-h.p. De Dion, covered the distance in 7 h. 25 min. 12 sec.

## A Voiturette Competition.

The "Auto" of Paris is organising a trial of voiturettes to take place from the 5th to the 12th November next. The

vehicles will be divided into two classes—single-cylinder cars of a maximum bore of 106 mm. and double-cylinder ditto 90 mm. bore. The trial will comprise six daily runs of about 200 kilometres, and a final test of 250 kilometres for those competitors still left in the contest. Each maker will only be allowed to enter three cars, and a prize for regularity will be offered to the best team of two vehicles.

## The Mount Ventoux Hill Climbing Competition.

The Mount Ventoux hill climb, organised by the Automobile Club Vaclusien, is being held to-day (Saturday) and to-morrow (Sunday), the tourists competing on the first day and the racers on the second. The principal entries in a speed division are Rougier on a De Dietrich, A. Clement on a Clement-Bayard, and Hanriot on a Darracq. In the tourist section there are about twenty-five competitors.

## The Ardennes-Motor Bicycle Race.

A motor-bicycle race for the championship of Belgium was held on the Ardennes circuit on Sunday last, under the auspices of the Belgian Automobile Club. The competitors were divided into racers and tourists, the former having to make three and the latter two rounds of a 75 kilometre circuit, the route being from Neufchateau to Florenville and back. There were many turns in the course, but there were also many stretches where high

speeds were attainable. Twelve competitors started in the racing class, and of these nine finished. Giuppone on a Griffon machine proved the winner, he covering the full distance of 225 kilometres in 2 hrs. 55 min. 45 sec., or an average of about 49 miles per hour. Cissac was second, and Demeester third, both riding Griffon machines. In the tourist section, Meura on a Sarolea made the best time (2 hrs. 9 min. 16 sec.) for the two rounds.

#### Public Services in Germany.

The Daimler Motoren Gesellschaft has just completed three 28-h.p. double-deck buses for service between Mittweida, Burgstadt, and Limbach. Negotiations are in hand with regard to the establishment of a motor-car service between Vossneck, Ziegenruck, and Walsburg.

#### The Italian Motor Industry.

According to statistics recently issued there are forty-eight companies, with a total capital of about £10,000,000, engaged in the manufacture of automobiles in Italy; fifteen of these con-

Gobron firm, for not only did all the five cars entered finish, but in the general classification they secured the first four and sixth places. The Brouhot team also did well; it consisted of four cars, which all successfully made the five runs, one of them securing first place in the sixth category. Appended are the winners in each class:—

Class.	Machine.	Driver.	Time. h. m.
1. Motor-bicycles ...	Bruneau ...	Sindre...	28 59
2. Motor-cycles ...	Contal ...	Pons ...	30 28
3. Single-cylinder cars of max. bore of 120 mm., average speed 25 kil.	Sizaire-Naudin...	Sizaire	28 53
4. Two-cylinder cars, max. bore 120 mm., 30 kil.	Darracq ...	Sire ...	24 3
4A. Four-cylinder vehicles, max. bore 90 mm., 30 kil....	Gobron ...	Dureste	17 59
5. Four-cylinder cars, max. 120 mm., 35 kil. ...	Gobron ...	Rigolly	17 19
6. Four-cylinder cars, max. 140 mm., 40 kil. ...	Brouhot ...	Feuillet	19 47

The Scene at Clermont-Ferrand at the Start of the Coupe d'Auvergne Competition.

cerns, with a capital aggregating £4,000,000, have been formed during the present year.

#### The Dust Nuisance in Paris.

The authorities in Paris are fully alive to the dust nuisance, and experiments with tarred roads are being made in various parts of the French capital, particularly on the thoroughfares at the side of the Seine, and towards Versailles.

#### The Coupe d'Auvergne.

The touring contest organised by the Automobile Club d'Auvergne was brought to an end on Saturday last by a run from Brioude to Clermont-Ferrand. Of the thirty-two competitors who started twenty-three succeeded in completing the five daily runs, during which a total distance of 580 kilometres was covered. The cup has been awarded to the Gobron car driven by Rigolly, this vehicle having made the best time, viz., 17 h. 19 min. The event was a brilliant victory for the

#### Miscellaneous Items.

The Rhenish-Westphalian Automobile Club is organising a 525-kilometre reliability contest from Dusseldorf to Fores and back for the 29th and 30th inst. The programme includes a hill-climbing competition and a speed trial.—The Moto-Club d'Eprenay is organising a motor-cycle reliability trial for the 16th inst. It will be held over a 120-kilometre course and be confined to machines of a maximum of 3-h.p.—It is reported that the German Daimler Company have decided to abandon speed contests and in future to only enter Mercedes cars in reliability or tourist trials.—The Clement-Bayard Company are bringing out a six-cylinder chain-driven car for the 1907 season.—The Deutsche Mercedes Verkaufs Gesellschaft has just been formed in Frankfort with a capital of £100,000 to acquire the sole selling rights in Mercedes cars in Germany, Denmark, Sweden, and Norway.

## THE TOURIST TROPHY RACE.

—♦—

INTEREST in the Tourist Trophy race, which is to be held in the Isle of Man on the 27th inst., is growing apace. Quite a number of the competitors have already arrived in Douglas, and practice over the route is indulged in each morning. On Thursday last week, in the course of the trial spins, an accident occurred to Mr. H. P. MacConnell, who was driving a Bianchi car. At a sharp corner in Sulby, where the road crosses the Sulby river, the car skidded, and, crashing through the bridge wall, dropped six or eight feet on to the bank below. Both Mr. MacConnell and his assistant were injured, but we learn that they are making excellent progress, and that the driver and the damaged car will be ready to take part in the contest.

As we mentioned in a recent issue, to obviate the inclusion of no fewer than five level crossings, a shorter circuit will this year be followed. It measures forty miles in length, and runs *via* Quarter Bridge, Union Mills, Peel, Kirkmichael, Ballaugh, Sulby, Ramsey, Mountain Road, and back to Douglas. The main point of interest in the new route is the avoidance of Castletown and the inclusion of Peel among the towns passed through. The cars will be required to make four laps, making a total distance of about 160 miles. On page 605 we give a profile of the course. As will be seen, it comprises a number of long gradients. As a matter of fact, it includes 660 yards of 1 in 12·4, 1,320 yards of 1 in 16·1, two miles of 1 in 10·9, one mile of 1 in 12·4, half mile of 1 in 14·1, and quarter mile of 1 in 16·5.

Two Views of one of the 18-h.p. Star Cars.

We have already given illustrations of several of the cars which will take part in the forthcoming contest, and this week we are able to reproduce photographs of the Star and Argyll vehicles. The Star Engineering Company, Ltd., have entered a couple of cars for the event, two views of one of which are reproduced above. The only variation in the vehicles from the standard type is that the wheel base is slightly longer, owing to the regulations as to the length of body, while the latter is made to the limit as stipulated by the A.C.G.B.I. The main frame is of pressed steel, the engine and gear-box being carried upon a separate underframe of angle steel

supported by channel cross members. The front axle is H-section jaw pattern, the swivels having ball bearing heads. The engine comprises four cylinders cast in pairs, 4 in. bore by 5 in. stroke, fitted with mechanical inlet valves, and developing 18-h.p. at a speed of 1,000 revolutions per minute. The carburettor is a special design for the purpose of reducing the consumption, and which, we understand, has proved very satisfactory. The ignition is by coil and accumulators. Four speeds and reverse are provided, this being controlled by a lever working in a "gate" quadrant, the drive on the top speed being direct. Only two sliding sleeves are used in connection with the gear—

The 16-h.p. Argyll Car.

the one working the reverse motion and first and second speeds, and the other the third and fourth speeds. A stop is fitted to the gate to prevent pulling the lever through the slow speed into the reverse. Hoffmann ball bearings are provided throughout the gear-box, while it may be added that the gears are all turned off the solid steel bar.

The Argyll Company have entered two 16-h.p. Argyll cars for the Touring Trophy race. As will be seen from the illustration given above, which depicts one of the vehicles, the main departure from the standard Argyll cars is the fitting of wire road wheels 32 in. in diameter. The engine is a four-cylinder one of 88 mm. bore and 130 mm. stroke, fitted with a special form of carburettor and two systems of high-tension ignition. The transmission gear is of the usual Govan type, while the frame is of pressed channel steel. The vehicles will be driven by Mr. George, of Messrs. George and Jobling, Newcastle-on-Tyne, and Mr. Thomas Parker, of the South Wales Motor Company, Cardiff. We may add that the last-named gentleman drove one of the Argylls in last year's race, and came in seventh.

## A NEW PARAFFIN CARBURETTOR.

—♦—

An interesting demonstration has this week been given of a new paraffin carburettor devised by Mr. A. Dorwald, and which is being put on the market by Messrs. Geo. Neal and Co., of Fenchurch Street, London, E.C. The apparatus has been fitted to a 30-h.p. Dennis motor-bus in service in Southend, and is reported to be giving very satisfactory results in practice. Until the illustrations are ready a full description of the new carburettor cannot be given, but in the meantime it may be mentioned that two carburettors are employed, the engine being started on petrol in the usual way, and that when the desired temperature is attained—in about four and a-half minutes—a change over to the paraffin carburettor is automatically effected by means of capsules subjected to the action of hot air, and connected with the petrol and paraffin supply valves, the one closing as the other opens. The exhaust is utilised in a special chamber, not only to heat up the explosive mixture, but also to furnish a supply of warm air for the capsules. In view of the increasing demand for and cost of spirit, the need of a reliable vaporising device which will enable paraffin to be used as the fuel in motor-vehicle engines is greater than ever, and the news that such an apparatus is now in use will certainly whet the appetite for the further particulars that are promised us.

## WOMAN AND THE MOTOR-CAR.\*

**M**OTORISM has its devotees among the fair sex as well as those of sterner mien. Ladies have their automobile club; they participate in the trials of cars; they luxuriate in the mechanical knowledge associated with motors, and they indulge in petrol talk after dinner. Mrs. Kennard and Mrs. Williamson have introduced the vagaries and delights of the automobile into their books—in fact, have allowed their chapters to radiate around the car, so that one wonders how some romances would have fared but for the appearance of the vehicle at the psychical moment. And now Mrs. Aria has given "Woman and the Motor-car," a volume to themselves, the said work being the autobiography of an automobilist who writes with a vim and celerity as buoyant and speedy as the "lamp-eyed monster" that "rushed restlessly along with its reverberant roar and rumble," giving the authoress an opportunity of alliterative writing.

Mrs. Aria was not ever a voluptuary of the car. She was as sceptical as a master of hounds in the early days.

"My own experience is," she declares, "typical," and proceeds:—"It was a clear case of hate at first sight when we met—the motor-car and I—a few years ago in that broad main thoroughfare in Bodmin, Cornwall, where, in striking incongruity, the ancient and the modern buildings, the far and the near customs, the old-world and the new-world inhabitants, hobnob in such peaceful neighbourliness. I was sitting behind a 'scratch pair' of horses, whose friendliness towards each other had been but intermittently satisfactory during a week's intimacy, when the strange tooting sound awoke them to a complete

A French Motor-Bus Service. A Snapshot at Trouville.

sympathy of fear, and urged them to wild plungings, which changed to sharp excited gallops, as the red-painted car bowled into sight, triumphant as any theatrical villain, all gleaming with brazen eyes, insolently sure of its success, and leaving in its track a vague sense of injury and injustice and an acute reality of odour. Five seconds' concession to their vagaries, tempered by the consciousness that the coachman had the whip hand of the argument, reconciled these horses to their first encounter with the new enemy, but I remained inconsolable, and alternately sceptical, indignant and fearful, as the prophecies fell thick and fast from my companions that here was the ideal solution to the traffic question and the fresh air problem, while here was food for the eternal appetite of greedy science."

Conversion came—on a Daimler, the justification for the change being found in Bacon—useful to the extent of half a page of quotation. The necessary reflections, with the story of a marriage and the subsequent death of one of the parties, enable Mrs. Aria to reach page 30, where verisimilitude is given to the story by the sketch of a well-known scene at Brighton. The hall of the Metropole there may prove a school for the uninitiated in the knowledge of the motor-car, as duly testified to by the authoress, who says:—

"Here the intelligent listener of gregarious habit may become a superficial expert while she waits, gleaned a harvest of truly valuable information, leavened, of course, with lies, after the most approved manner of the earnest sportsman, which may be easily dished to taste, and served glibly to any complete amateur who may follow during the week. From midday until three o'clock the cars are arriving, aggressively or suavely, stumping or gliding up to the portico, according as their machinery may permit, or their chauffeur may con-

sider consistent with his importance; while the little crowd on the doorstep criticises, with a fearlessness unbiassed by knowledge, the customs, conveniences, and disadvantages of each new-comer. The bedraggled, weather-beaten and soiled travellers are all complacent, glad, self-satisfied, blatantly rejoicing in their feats of distance, and firmly resolved to be lenient, rather than too accurate in their judgment of the triumphs of time. They stamp about in furs, glistening with frost; they are blue in the cheeks, purple in the hands, and scarlet round the throat; yet valiantly they will declare they are not a bit cold, and invariably they will describe some special portion of the road they have traversed as having displayed some new, unexpected and unprecedented virtue or vice."

We confess we had read thus far, beguiled by the excellent pen wielded by Mrs. Aria; but somehow interest fluctuated as we continued through a mixture of technology and adventure that seems to cause a series of splutters, appropriate, it may be, to the subject, but often tantalising to the reader. One heroine chooses her friends according to the horse-power of their cars, rejecting all below 14-h.p. and beaming adoringly at the fortunate possessors of cars of 50-h.p. and thereabouts. Another gets her clothes from Thomas, of 32, Brook Street; she goes to 219, Shaftesbury Avenue, wanders into Great Marlborough Street, dines at the Metropole, and has tea at the Carlton; reads the "Morning Post" and mentions the "Referee" and the "Matrimonial News"; glories in a description of the "Ellion" (sic) accumulator, and declares that "the whole success of the electric carriage has been the garage system which the Electromobile Company started at Curzon Street." This is not all that may be ascertained from a perusal of this autobiography, which ought to be of value to the makers of half-a-score of vehicles mentioned in these variegated pages.

But all the information is not intended for the whole body of motorists. There are special portions for the ladies, and here Mrs. Aria writes with almost unexampled knowledge:—

"I returned to my chair for further consideration, and argued that the most self-reliant shape of hat is the turban, and the prettiest veil is of bordered chiffon; any further trimming the hat may require being best supplied by a small wing on either side, impressed with mercurial suggestiveness. The ideal colour for the millinery for motoring is, I contend, pale blue, for this does not show the dust too aggressively, and it is universally becoming, while it will bestow its influence of elegance on the most nondescript of coats. Veils of green or brown may, however, be selected in the ophthalmic interest. Besides the turban shape there is an excellent hat, a miniature edition of the old dustman's hat, made of stitched velveteen, which turns up or down at the back or in front, and is easily suited to the individual outline. Markedly effective may be such a hat of bright green velveteen, elaborately stitched and bound with galon, and for this I would advise a green veil to match, with a deep hem-stitched border. A russet shade of red in velveteen is most attractive, but the veil to match, essential to its complete success, is rather trying to the eyes. Dark blue, not too dark, is also very becoming, and though it may be urged, and rightly urged, that velveteen entraps the dust, yet I would boldly select it, trusting to the veil for its defence, assisted by a sublime faith in the simple expedient, ignored by no well-conducted and earnest motorist, of never going out unaccompanied by one clothes brush, if not two. In hats, primarily, softness and lightness should be considered. No one wants to wear a heavy hat for many hours in a wind, or even out of it, and, therefore, velveteen and cloth should always be chosen in preference to felt or straw—I mean, of course, for long journeys. The mere meandering about town, or up and down a country road, gives altogether wider scope to decorative dress."

Having thus outlined the scope of the work, we trust we shall not be thought ungallant in pointing out to the authoress that the maker of the steam car is not "Serpolette," even when it has to be dragged along as suggestive of an Opera Bouffe. Nor do we see the reason why one particular kind of table water is eulogised, when the proprietors of the Perrier water have lately rendered excellent service to the motorist by the publication of their splendid road map. Perhaps this may be remedied in a second edition, for "Woman and the Motor" is a pleasant volume, and, although the combination of literature with many trade names may not altogether seem commendable, it may be that we are unaccustomed to the dispensation of knowledge in such a light and attractive form. This first volume on the subject from Mrs. Aria should give the reader pleasurable anticipations of her next volume on motoring, from which references to the Corona hat-comb and a certain powder of rice-flowers might, however, be omitted without detracting from its literary merit. The excellent model of the anatomy of the car which is also to be found within the covers of the volume is a feature of real value.

\* "Woman and the Motor-car." By Mrs. Aria. London: Sidney Appleton.

THE work of demolishing a number of houses at the side of Messrs. Friswell's extensive depot in Albany Street, N.W., has been commenced. A large addition to the present establishment is to be erected on the site.

SOME experiments with a new motor spirit are, we hear, being carried out in the Midlands.

ACCORDING to a provincial newspaper a motor-car driven by powder is at present in the Isle of Man!

THE Rt. Hon. A. J. Balfour who has already had four Napier cars, has just placed an order with S. F. Edge, Ltd., for one 40-h.p. and one 60-h.p. vehicle, both of them, of course, being of the six-cylinder type.

WE understand that the Brasier Company are giving up the construction of live axle cars, and that the 1907 Brasier cars will all be fitted with side chain transmission.

THE Automobile Club of Guadalajara has been organised in Guadalajara, Mexico. One of the principal objects of the new organisation is the establishment of good roads in the State of Jalisco.

THE General Commandant of the French Army Corps placed two Mors cars at the service of the English officers attending the recent manoeuvres, in order to rapidly convey them from point to point.

MESSRS. WILSON AND STOCKALL, of Bury, who recently supplied a motor ambulance to a hospital at Belfast, have now brought out a pocket first aid ambulance case for motorists and other tourists who run risks on the road.

MR. NICE, of Nice's Motor Garage, Clacton, is an efficient motor engineer. He is a very experienced man in all kinds of repairs, and a correspondent testifies as to the modesty of his charges. He has every facility for executing any kind of repair.

MESSRS. GILLET'S, LTD., of 199, Piccadilly, W., are developing a plan of work in which they are taking repair work under "penalty," viz., that for every day after the time stipulated they pay so much penalty, this amount to be agreed upon between themselves and the client, and according to the magnitude of the work. Their shops are well equipped for every sort of motor repair work.

MESSRS. RD. ARMSTRONG, LTD., of Preston, have brought out a new soap for motorists known as "Tetronia." This will quickly and easily cleanse oily and grimy hands without the use of hot water, being equally soluble in cold water. As a soap for the garage its merits are of no mean order, and it has been adopted in most of the leading Lancashire repair establishments. Now its reputation is coming southward.

THE illustration herewith depicts the second 20-25-h.p. Brotherhood car built to the order of Mr. R. H. Fowler, the

An 18-h.p. "Siddley" car with specially designed landaulet body by Hooper, supplied to the Lord Granmore and Browne.

FIELD-MARSHAL LORD ROBERTS and Countess Roberts have been on a motor-car tour in Wales, after which they proceeded to Scotland by the same means of progression.

MR. T. K. PHILLIPS is now in charge of the engine department of the Simms Manufacturing Company, Ltd., and will deal with the supply and sale of engines for industrial purposes.

A NEW petrol-electric car, of German construction, and known as the Dynamobile, is being introduced into this country by Messrs. Kuettner, MacDonnell and Cookson, Ltd., of Endell Street, London, W.C.

THE 16-20-h.p. Clement-Talbot car which Messrs. Clement-Talbot, Ltd., supplied the North British Rubber Company, Ltd., some two years ago for the purpose of testing tyres, has now run 37,000 miles, it having been used in all weathers, and driven over rough and hilly roads in all parts of Scotland.

THE Lancashire Steam Motor Company, Ltd., have lately completed a 35-40-h.p. petrol 'bus chassis for the Clacton-on-Sea Motor Omnibus Company, Ltd. The vehicle is provided with a char-a-banc body, designed to seat thirty-two passengers, the rows of seats being arranged gallery fashion, so that everyone can obtain a clear view. A canopy over the whole length is provided, this being enclosed at the back and for two feet at each side of the rear portion by glass panels.

MR. CHAS. WILLIAMS, of South Parade, Matlock Bath, has sent us a sample of the "Bright Spark" file he has lately introduced; it consists of a small file specially cut to make a dead smooth surface on the platinum points of tremblers and contact screws, at the same time reducing the metal by the minimum quantity. The file is made to hinge into a brass case on the pocket-knife principle, which prevents it from being broken; it can be carried in the waistcoat pocket, and should prove a useful little accessory.

WITH the view of improving the roads, the Automobile Club of Canada, of Montreal, has issued a circular, offering £40 in prizes to the farmers or other owners of property on the Island of Montreal, who keep their particular sections of highway in the best condition, and do most to improve the same. The Toronto Automobile Club has also decided to offer three prizes of £100, £40, and £20 respectively, for a road building competition to municipalities in the vicinity of Toronto. The competition will be carried on under the direction of Mr. A. W. Campbell, Ontario Commissioner for Good Roads.

head of the great engineering firm of Messrs. Fowler and Co., Leeds. The new works that are being erected at Tinsley, Sheffield, by the Brotherhood-Crocker Motors, Ltd., are now nearing completion, and in a few weeks will be ready for occupation. The main shop is composed of five bays, each 240 ft. long, in addition to which are other buildings, comprising the smiths', hardening, engine and car testing, running-shed, pattern-making, &c., while the front of the building is occupied by the administrative offices.

MR. FRED G. CAVE is establishing a motor-car repairing establishment at 22, Horsemarket, Northampton.

JOBBMASTERS in the West End are complaining of a falling-off in their business owing to the increasing popularity of motor cars. Many of them are either converting their premises into garages or are devoting some space to the storage of motor-cars.

MESSRS. W. AND F. THORN, the well-known motor-body building firm, inform us that they have acquired the old-established business and premises of Messrs. H. W. Mason and Co., coach-builders, 293, Kingsland Road, London, E., which will be carried on under the personal supervision of one of the partners of the firm.

MR. BEERBOHM TREE is an enthusiastic motorist, and has taken considerable interest in his latest car—a 35-h.p. Rochet-Schneider. The body is of the limousine-landaulet type, and was constructed specially to meet the requirements of the famous actor when on tour, being sufficiently large for Mr. Tree to sleep in should occasion arise. It was designed by Messrs. Sayers and Company, of Wandsworth Road, Vauxhall, whose *debut* was one of the features of the Spring Show at the Agricultural Hall. The seating accommodation is for seven persons, including the driver, and the vehicle is arranged so that all business can be conducted while travelling, special

lock-up pockets for letters, correspondence, &c., being provided, while all the other fittings are of the most useful description, the car presenting a good example of modern carriage work.

THOSE motorists of a mathematical turn of mind may be interested in the following problem from the 1905-6 calendar of Burlington House, Cambridge, and send us the solution of the same:—A cyclist and a motorist start at the same time from two places thirty miles apart; the car travels twice as fast as the bicycle. After meeting and resting, each starts back, travelling one mile per hour faster than they did on the out journey; the cyclist reaches home five minutes earlier than the car does. What was the pace of each on the outward journey?

A NEW motor tyre list comes from the Dook-Swain Tyre and Rubber Co., Ltd., of the Soho Tyre Works, Pollard Street, Manchester, who draw special attention to their beaded-edge tyres of the "Standard" and "Special" patterns. The latter is particularly flexible, resilient, and durable, owing to the super-fine quality of rubber employed, which almost entirely does away with "tread cutting." The Dook-Swain toughened treads are another speciality of the firm, which undertakes re-treading at very reasonable rates. This is a class of work often imperfectly done, and which motorists frequently prefer to be executed in their own district. Hence the importance of the facilities possessed by the Dook-Swain Co. so far as the County Palatine is concerned.

It is expected that a motor-bus service connecting up the docks at Cape Town with the tramway system will be in operation within the next few months.

MESSRS. J. MARSHALL AND Co., the well-known oil refiners, of Mossley, Manchester, are bringing their motor oils directly to the notice of motorists in the Emerald Isle.

ON Wednesday morning the premises adjoining the head quarters of the Winton Motor Carriage Company were destroyed by fire. The motor-cars were taken out and lined the side of Holborn Viaduct, E.C., attracting much attention.

MESSRS. JACKSON BROS., of the Central Motor Garage, Blackpool, are making special arrangements for the storage of cars during the forthcoming race meeting at this popular seaside resort. In addition to their own premises they have secured the use of the Drill Hall, in Yorkshire Street, as well as several private coach-houses, the latter being intended for the convenience of those motorists who desire to keep their cars in a lock-up garage.

THE General Petroleum Co., 19-21, Billiter Street, E.C., are placing upon the market the "Borneo" motor spirit, which possesses a high specific gravity. In order to make its merits known for cars of heavier type, the company will, for a limited period, supply it at low rates. Referring to air feed, for the guidance of those using "Borneo" motor spirit, the company intimate that an arrangement must be made for about 25 per cent. more air in their mixture to ensure complete combustion.

THE motor-car service which Mr. R. P. Doudney contracted with the Postmaster-General of Ceylon to run between Lunugala and Batticaloa from June 1st next year is not to commence on that date. The delay is likely to be considerable, as Messrs. Walker Sons and Co., Ltd., through whom Mr. Doudney was ordering the cars, have been informed that the vehicles ordered will not be ready for twelve months. The matter is, therefore, in abeyance—the decision resting with Mr. Doudney as to whether he should ask for an extension of time.

AMONG the late entries for the forthcoming Tourist Trophy Race is the "Vici" car, the product of the British United Engineering Company, Ltd. The vehicle is London built, but, owing to the fact that it was necessary, in order to get the chassis put through quickly, to utilise one or two Continental fittings, it is not described as being of wholly British manufacture. When, however, the company is ready to commence delivery, the chassis will be wholly of British manufacture. The car follows approved standard lines in many respects; it is fitted with a four-cylinder engine of 12-16-h.p., and possesses a pressed steel frame, with a nickel steel front axle. In addition to steering wheel control, a foot accelerator is provided. The change-speed gear, which is controlled by a lever working in a "gate," gives four speeds forward and a reverse. The transmission is by means of a cardan shaft on to a live axle. Ball bearings are fitted throughout, namely, in the live axle, gear-box, and all four wheels.

DISSOLVED acetylene for the lighting of motor vehicles forms the subject of a neat pamphlet brought out by the Acetylene Illuminating Company, Ltd., of 268, South Lambeth Road, S.W., who have done much to promote the acetylene industry in this country. The dissolved acetylene process is, briefly, as follows:—Cylinders of any size or dimensions are filled with a porous material such as asbestos, or charcoal cement of a fixed porosity, which makes an explosion in the cylinder an impossibility. The porous material is then soaked with a fixed quantity of acetone. Acetone is a liquid hydrocarbon, which has the peculiar property of absorbing twenty-five times its own volume of acetylene at atmospheric pressure, and 15 deg. Cent., and will continue doing this for every atmosphere of pressure that is applied to the gas. The cylinders are generally fixed either on or under the step on the driver's side of the car by means of a clip and a stirrup joint. The gas is led from the stirrup joint through a steel tube to the regulator and pressure gauge, which can be fixed on the dash-board. From the governor or regulator it is passed to the lamps. Cleanliness, safety, absence of odour, economy of consumption, and brilliance of light are advantages claimed for this system.

## SOME CURRENT TOPICS.

### Sperm Oil as a Motor Lubricant.

In our correspondence columns this week a correspondent raises the interesting query as to the suitability of sperm oil for the lubrication of petrol motors. Of the oils of animal origin sperm is the best lubricant, its peculiarity being that its viscosity is much less affected by temperature than that of other oils. Its adhesion to metallic surfaces is next to, but less than, that of mineral oils. Its viscosity degree at ordinary temperatures is about 10 to 12, water being 1, which does not diminish with high temperature at anything like the rate of mineral lubricants. The latter, however, can be obtained showing a

not slippery) road-surface, of the colour of asphalt. Where the preparation is used watering is stated to be unnecessary; moreover, it is unaffected by rain, being waterproof, and mud is much diminished even after the first dressing, while after continued treatment a surface somewhat like an asphalt road is obtained, which is an absorbent towards dust in fine weather and effectually prevents the formation of mud in wet weather. A mile of the main road between Richmond and Ham has been treated with Hahnite by Mr. J. H. Brierley, the Borough Surveyor of Richmond, and on Monday last a number of gentlemen interested in the solution of the dust problem journeyed down to inspect it. Motor-cars of various dimensions and speeds, as well as other vehicles, were driven over the treated stretch, and the freedom from dust was in marked contrast to the conditions which prevailed on the untreated portions of the road. As to the efficacy and durability of the liquid, Mr. Hahn,

Profile of Tourist Trophy Course. (See page 601).

much higher viscosity, and hence, apart from questions of price, which are, of course, in their favour, these latter are preferable in practice at the high temperatures at which they have to function.

### The Dust Problem.

That the seriousness of the dust problem is being fully realised is evidenced by the large number of dust-preventing compounds which are being introduced, and the readiness which local authorities are showing to give any new preparation or process a trial. The latest product of the kind to be brought to our notice is that known as Hahnite, named after the inventor, Mr. R. M. Hahn, and which is being put on the market by Hahnite, Ltd. The new compound is described as being an insoluble liquid which, when sprayed on to the road, oxidises, and thereby forms an impervious coating of great durability and binding properties, which is capable of combining with all dust that may be blown on to it and effectually preventing it from rising up. The coating gives the road a dustless, smooth (but

stated that an interval of eight weeks suffices between the first and second, and second and third dressings; that then the intervals may be successfully increased; that the strength of the solution may be lowered also, from, say, 25 per cent. to 10 or 5, and that the saving to the roads by the use of the preparation, which is applied by means of an ordinary watering cart, more than counterbalances the slight extra cost its use entails.

### A Few Hints Regarding Inlet Valves.

Inlet valves which are seated with copper asbestos washers are frequently difficult, when once removed, to re-seat soundly. One of the most satisfactory methods is to smear each side of the washers with a mixture of black lead and boiled oil, and let them stand for an hour or so. A very frequent cause of loss of power, and one that is frequently overlooked, is loss of temper in valve springs. It is always well to keep an eye to the inlet valve ports; sometimes they "fur" up with carbon, &c., to such an extent as to restrict the opening of the valve; hence loss of power.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
87-88, Charing Cross Road, W.C.]

### CHARGES IN SCOTLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having returned from a month's motoring holiday of some 2,000 miles, mostly in Scotland, may I give your readers a few points? Never store your car at the hotel garage without inquiring the charge. I travelled from Oxford, through Yorkshire to Durham, Edinburgh and St. Andrews. Here I was charged 10s. 6d. for seven days' garage. I do not object to this charge when the place is not overcrowded. At Oban the Great Western Hotel charged two shillings per night for five nights, and the charge for petrol was threepence per gallon higher than at other garages in the town. Oban is not a place to visit by motor-car. The road there by Crianlarich, Tyndrum and Dalmally is terribly bad. To avoid this I returned by Connel (railway truck across the bridge 7s. 6d.) to Ballachulish (car balanced on planks across a boat which is rowed across by six men, fee £1, a dangerous and primitive proceeding), to

Mr. Stenson Cooke, the Secretary of the Automobile Association, inspecting the Scouts on the Brighton road. The car is a 15-h.p. Daimler lent by the Victoria Street Garages, Ltd.

Fort William, Pitlochry, and Perth. Road bad until Pitlochry is reached. At the Station Hotel, Perth, a charge of 2s. 6d. was made for garage and 2s. 6d. for assisting my man in cleaning the car.

From Perth to Carlisle and from Carlisle home. Petrol ranged from a shilling to 1s. 4d. per gallon. The roads in many places were being repaired in the old stupid fashion by laying new metal right across, although the steam roller was in attendance and might have rolled one half at a time. Some intelligence might be brought into our road repair methods considering the vast number of motor-cars now using the main routes. In one case the roller was covered up for the night and we had to plough our way through thirty yards of unrolled metal which had been thrown down late. I burst three driving tyres and one front tyre during the trip and found the Stepney spare wheel very useful.

The conclusion I came to was to leave my car in Glasgow another year and do the west coast by steamer. The roads west of Perth and Inverness are not fit for motors. During the whole run we had no stoppages except for tyre troubles, and no accidents barring running over two dogs on the last day. Railway fares were entirely avoided, and these for a party of five adults would have amounted to a very considerable sum. I find a loud mouth whistle very effective in waking up sleepy carters and others when driving a powerful car. Hotel charges are notoriously higher in Scotland than in England. At Tyndrum we stopped for a cup of tea and were charged 7s. 6d., or 1s. 6d. each. I happen to know, being secretary of a golf club, that a good

afternoon tea can be supplied at a cost of twopence per head. We charge our members sixpence and make a handsome profit. When one has to pay 1s. 6d., we can only conclude that we are being charged for the scenery, which certainly is superior in quality to the tea one gets in Scotland.—Yours truly,

W 6.

### CONSIDERATION ON THE ROAD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have often noticed the many hospitals, asylums, and sanatoria, owing to their proximity to the road, suffer incalculable discomfort if not harm from the dust. Mr. Wilson Noble has, in your last issue, with true altruism, drawn attention to the sufferings of the patients at the Children's Hospital on the Epsom road, in consequence of the clouds of dust that envelope those whose affliction tempts them to take the air. To remedy the nuisance and assure the patients the beneficent results from living and sleeping in the open, I am instructed by my Board to say that if permission be granted by the authorities, my company—Dustroy, Ltd.—will at their sole expense lay down a dustless road on the Taafalt system, the whole length of the hospital, which will prevent the inconveniences and complaints daily in evidence.

We shall also be prepared, for those similarly situated and inconvenienced, to lay a dustless Taafalt road for the actual cost. If secretaries or committees of such philanthropic institutions will communicate with me, all particulars will be given them and we will do our share, free of reward or gain, to show that Taafalt is a panacea for the dust evil. Those who are unfamiliar with the Taafalt system and its efficacy in preventing dust should inspect the road from Westcliff-on-Sea to Leigh-on-Sea, about two and a half miles in length, which has been laid over two years without being repaired; although it faces south, it has not been affected by the heat and has withstood the sea washing over it two consecutive winters.—Yours truly,

T. D. KELLY.

### A DIFFICULTY IN STARTING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be greatly obliged if you can inform me of the reason my 15-h.p. car takes so much starting. I can only get it to commence running by advancing the ignition to the extreme limit, and even then it will only start very slowly, and after the handle is past the highest compression. The magneto has been overhauled by the makers and is in order.—Yours truly,

JONATHAN.

[The trouble experienced by our correspondent seems to point to the fact of the ignition cams not being set correctly. If these were correct it would be almost an impossibility to start the engine with the ignition fully advanced without disastrous results (from backfire), and we would advise a thorough examination of this, and ascertain if the time of spark is not somewhat late.]

### BRIGHT PARTS ON CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that the motor-car is becoming a vehicle of utility rather than of sport, I should like to draw attention to the large number of polished brass or plated parts on automobiles. The waste of time and labour involved in cleaning all this bright work is, in my case at least, a considerable annoyance, and I am looking forward to the time when it will be avoided. Aside from the trouble involved in keeping them clean, there are other objections to an unduly lavish use of bright work in the external fittings of motor-cars. To one driving long distances upon a cloudless day the reflections from some parts of the brass-work, when the sun is in certain positions, are almost intolerable to the eye.—Yours truly,

W. FINCH.

### SPERM OIL AS A MOTOR LUBRICANT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you could give me some information as to the flashing, burning points and viscosity of sperm oil. I should also be glad to know whether it would be suitable for use for petrol engine lubrication.—Yours truly,

R. J. HUTCHINSON.

[A reply to the query raised by our correspondent will be found elsewhere in the present issue under the heading "Current Topics."]

### TESTS OF MOTOR LUBRICATING OILS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have carried out a set of tests on oils taken from the crank chambers after running some time, comparing the tests with those of the original oil. We have been careful to arrange that the original oils shall in each case have been of different brands, and I may roughly state the results to be that most of the original oils have a flash point of 400 deg. Fah. to 420 deg. Fah., and that after running a few

weeks in the car this test drops to 260 deg. Fah. to 280 deg. Fah. This change is apparently not due to any decomposition, but rather to the fact that after being in use some time it becomes, so to speak, impregnated with a small proportion of stale petrol which has passed the piston rings. This would seem to show that in practically all cases far too much petrol is used, and if any of your readers has a car on which he uses nearly the minimum amount of petrol possible to give perfect combustion, I should be glad if he would send a sample of the oil from his crank chamber to me at Phoenix Wharf, West Ferry Road, Millwall, E.—Yours truly,

A. DUCKHAM.

### AN UNUSUAL IGNITION TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I had an unusual experience with my car, a single-cylinder one of 8-h.p., the other day, and as I know you are always glad to receive particulars of occurrences of this nature the following may be of interest. I was coming steadily along the Bath road from Maidenhead when all of a sudden the engine stopped. I went through the usual sequence of operations and found everything in order, the wiring, accumulators, coil, valves, &c., but yet the motor would not start. Thoughts of having to leave the car and return home by train were beginning to enter my mind, when suddenly, on having another tug at the starting handle, I noticed the contact maker was not rotating. An examination showed that it was loose on the spindle and that the taper pin which held it in place had worked out and got lost. The cause of the trouble located, the next thing was to remedy it. A look through the tool-box brought to light a French nail, which I passed through the hole in the contact maker and the spindle, holding it in place by

provided with a knob of some such material, in order to enable them to be handled with impunity when hot. The points I have mentioned are of a small nature, but the motor-car has arrived at the point of development where, with the larger problems in a condition approaching solution, the minor points tending toward comfort and convenience should be carefully worked out.—Yours truly,

R. FRASER.

### DE DION CAR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am driving a 9-h.p. De Dion car, and when on top speed I have a rattle similar to a spring on a revolving cog-wheel, and am unable to find the cause. I should deem it a very great favour if you could tell me the probable cause and remedy.—Yours truly,

JOHN BOORER.

[We should think that the rattle mentioned by our correspondent is due to something being slightly out of place (or worn) in the gear-box coming in contact with the gears when on top speed, but, as it is not stated from what part of the car the rattle proceeds, it is very difficult to say. If from the gear-box, it would perhaps be advisable to dismantle and ascertain, as no doubt it would be difficult to do so with the gear-box in place.]

### DIRT IN PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad to know from fellow motorists whether their experience is the same as mine. Quite recently I have had quite a lot

Photo by]

The Auto-Cycle Club's Hill Climbing Competition at Birdlip. (See page 609.)

[E. W. Ashworth.

bending over the end. With this temporary repair I managed to get home without further delay, the contact maker doing the work in excellent style.—Yours truly,

BRENTFORDIAN.

### A SUBSTITUTE FOR THE INSPECTION PIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—You would be doing a great service to many motorists if you could obtain working drawings and specifications for the apparatus mentioned in your issue of 8th inst. and publish them. Your correspondent "Utility" might, perhaps, be induced to furnish same. The points that are not quite clear are the geared drum and its action, and how the car is kept from running back when the horizontal position is reached.—Yours truly,

M. D.

### BURNT FINGERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Among the petty annoyances of motorists is that of burning the fingers by accidentally touching, when having to examine or make an adjustment on the motor, the exhaust pipes. These are usually the hottest parts, and the cause of many accidental burns, and it should not be necessary to reach among them to get to the carburettor, contact maker or pump. The filling cap of a radiator is also usually very hot after considerable running, and should it be necessary to replenish the water supply, a piece of waste or heavy gloves must be used to protect the hands while the cap is being detached. There would seem to be no reason why the present brass caps should not be covered with some non-conducting substance, or

of trouble owing to the irregular working of the carburettor, which, as far as I can ascertain, is due to dirty petrol. The other day my engine commenced to splutter, and on enquiring into the cause I found that no spirit was emerging through the spraying nozzle. Opening up the float chamber I found a lot of red-coloured sediment at the bottom, although it is only about two months since I cleaned it out. I am very careful to always fill the tank through a funnel. In view of the increased cost of spirit, I think one has at least a right to expect clean petrol and not stuff which is likely to bring your engine to a stop. It is no joke to have to tackle carburettor troubles on the roadside, especially in the dark.—Yours truly,

R. FOSTER.

### BACK FIRING IN THE CARBURETTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I noticed an inquiry in a recent issue regarding back firing in the carburettor. There are a number of possible causes for this trouble. An engine will back fire when the voltage of the accumulator is low, or the platinum points of the trembler are fused, or when the sparking plug is dirty, or the porcelain broken. Too long a contact on the contact maker will sometimes cause back firing, if there is some other cause for missing, as a missed explosion will sometimes cause the inlet valve to open by suction, or a vacuum in the cylinder during what should be the explosion stroke, even with a mechanically-operated inlet valve, especially if the throttle is partly closed or the mixture weak. I have cured the trouble in a number of cases by making the length of contact shorter. With the spark retarded an engine should throttle down so that it will just keep running.—Yours truly,

R. J. ROBINSON.

## MOTOR RACING ON SKEGNESS SANDS.

THERE was an enormous crowd at Skegness on Saturday last on the occasion of the motor race meet on the sands, the success of last year's meeting having evidently given anticipations of a good afternoon's sport. Of course, the racing cars were the great attraction, and to some extent the public were disappointed, for the track was not considered sufficiently safe enough for such high-powered cars as were present to race together.

Dr. W. F. Thomson at the wheel of his 22-h.p. Dennis car which took first place in the Appearance Competition.

It had been expected that the high September tide would have been effective in a succession of days in consolidating the bank forming the course, and covering it with a layer of good hard sand. This, however, was not the case. The weather—being too good!—was against it. However, the other classes provided plenty of excitement, and the racing cars gave exhibition runs, reducing the pace at the loose portions which, as the vehicles passed over them, turned into ruts, putting on speed on the hard part, in full view of the spectators. Among the racers were the Maharajah Takari's 130-h.p. De Dietrich, which had done very well in trial runs on the previous day; Mr. W. J. Wright's 80 and 100-h.p. Darracqs; Mr. Cecil Edge's 90-h.p. Napier; Mr. H. R. Pope's 100-h.p. Itala, and Mr. A. Lee Guinness's 200-h.p. Darracq.

The Nottinghamshire Automobile Club organised the meeting as last year, and of course did it well. In the regrettable absence of Mr. Booth Granger, the hon. sec., who is laid up as the result of an accident at Douglas, the competition and other secretarial work was ably undertaken by Mr. E. W. Wells. Prior to the racing an appearance competition was held on the North Parade, in which some very fine cars took part. The first prize fell to Dr. W. T. Thomson's 22-h.p. Dennis, which was second last year, Dr. A. B. Gass's 14-h.p. Renault, also a perfectly kept car, winning the second prize.

The motor-cycle race had two heats, but the four riders, all with two-cylinder machines, Mr. F. G. Smith, 5-h.p. Clyde; Mr. D. C. Bolton, 5 h.p. Rex; Mr. L. Barlow, N.S.U., and Mr. T. Woodman, 5 h.p. Vindec, went together. Barlow suffered from belt troubles; Bolton and Smith fell in ruts in the sand, while Smith fell heavily and was rendered unconscious for some time; thus Woodman alone finished, and at a good speed. The mile handicap for the members of the Notts. Automobile Club brought forward a large number of competitors, and in the ten heats there was a representative turn-out of cars. Mr. M. Ross Browne, after running in three heats and cross heats, proved the winner, with the 22-h.p. Minerva that is entered for the Tourist Trophy race, the second being also a 22-h.p. Minerva, that of Mr. J. A. Doran. The winners of the heat were:—Mr. M. Ross Browne, 22-h.p. Minerva (31 sec.); Mr. A. Farnell, 30-h.p. Daimler (8 sec.); Mr. H. Belcher, 16-20-h.p. Humber (31 sec.); Mr. F. A. Bolton, 35-h.p. Daimler (scratch); Mr. R. W. Wright, 10-12-h.p. Humber (55 sec.); Mr. V. Riley, 9-h.p. Riley (55 sec.); Mr. A. R. Atkey, 16-h.p. Minerva (50 sec.); Lt.-Col. Birkin, 20-30-h.p. Renault (22 sec.); Mr. J. Truman, 28-h.p. Daimler (20 sec.), and Mr. J. A. Doran, 22-h.p. Minerva (31 sec.). In the cross heats Mr. M. Ross Browne, Mr. R. M. Wright, Lt.-Col. Birkin, and Mr. Doran were the winners. In the semi-final Brown beat R. M. Wright, who stuck momentarily in a bad place in the track, and Birkin beat Doran, the final resulting as given above.

The scratch races followed, all over a distance of a mile, that for cars under and not over £200 being first. In this the little 9-h.p. Riley,

driven by Mr. V. Riley, proved the winner, thirty yards from Mr. Spencer Downing's 10-h.p. Alldays.

In the mile race for cars not over £350, Mr. R. M. Wright, on a 10-12-h.p. Humber, came in first by about sixty yards from Mr. Spencer Downing's 10-h.p. Alldays. Wright's car commenced to misfire near the finishing line, but he managed somehow to get home. The 8-h.p. Stanley steamer did not finish.

There were five heats in the mile race for four-seated cars, the chassis price of which was not over £500. Mr. F. Wilkinson's 20-h.p. Stanley steam car won easily. Mr. T. H. Woollen's 12-16-h.p. Clement-Talbot, which was second, made a very good impression on the public. The heats were won by Mr. Ross Browne, 22-h.p. Minerva; Mr. T. H. Woollen, 12-16-h.p. Clement-Talbot; Mr. Cripps, 16-20-h.p. Argyll; Mr. H. Belcher, 16-20-h.p. Humber; and Mr. F. Wilkinson, 20-h.p. Stanley steam car.

Mr. J. E. Lound's 35-40 h.p. Beaufort came home first in the class for four-seated cars of a chassis price of not over £700, but the prize is withheld pending the consideration of the racing committee. Mr. H. R. Pope's 24-h.p. Itala had won the second heat, but was announced as being disqualified. Mr. A. Farnell's 30-h.p. Daimler had won the first heat and competed against the Beaufort in the final.

The mile scratch race for four-seated cars of a chassis price of over £700 was won by Mr. C. Edge in the first place, his 50-h.p. Napier just beating Mr. E. M. C. Instone's 35-h.p. Daimler by a couple of yards. The final, however, was re-run, when Mr. Instone came in first by a narrow margin, the Daimler thus securing a notable victory.

The annual dinner and presentation of prizes took place afterwards at the Lumley Hotel, Mr. Charles Hardy, president of the Notts. Club, being in the chair. There was a very large and influential gathering, and some brief but excellent speeches. Mr. S. Coetmore Jones, Earl Scarborough's agent, and chairman of the local committee, deplored the fact that the elements were against them, but he thought they had had a most successful meeting, and that the Notts. Club had taken the abandonment of the racing competition and of the attempt at record in a true sporting spirit.

### MOTOR PROSECUTIONS.

HENRY SAMUELS, of Liverpool, has at Southport been fined £5 and costs or a month's imprisonment in each of three cases—for not having proper identification marks attached to his car, for being without a licence, and thirdly for fraudulently using another driver's licence. John Hope, motor-car owner, Bootle, was also fined 40s. and costs for lending the licence to the first defendant.

### THE CANNING CUP COMPETITION.

THE Dublin centre of the Motor Cycle Union of Ireland ran off the second reliability test of one hundred miles on Saturday last. The course was from Dublin to Carlow and back, and the roads in good

Some of the Cars on Skegness Beach. The white vehicle in the foreground is the Maharajah Takari's 130-h.p. De Dietrich Racer.

condition. The five members who qualified on the previous Saturday took part in the run, which passed off without incident, E. Former, who punctured before reaching Carlow, being the only one to meet with trouble. All arrived at Inchicore with the following result:—

	Marks.
R. E. Price, 2½-h.p. F. N. (holder) non-stop	100
W. Jacques, 3-h.p. Aleyon, non-stop	100
C. E. Murphy, 3-h.p. Triumph, non-stop	100
W. H. Guilfoyle, 2½-h.p. Minerva, non-stop	100
E. Former, 2½-h.p. F.N., one puncture	...

The third test will take place on Saturday, the 22nd inst., starting at 12 o'clock from Inchicore Bridge for Carlow and back.

## CLUBS AND ASSOCIATIONS.

### AUTO-CYCLE.

A SERIES of hill-climbing competitions, arranged by the Auto-Cycle Club, were decided on Saturday on the famous Birdlip Hill road, near Gloucester. There was a record entry of 72, and but few absentees. The hill is one mile 140 yards long, and has gradients of one in five, one in six, and one in seven, the easiest portion being one in fifteen. The following were the results, zero representing the fastest time, while the figures given after the names of competitors represent the time behind the winner in each class.

Class 1, for machines with engines having a cylinder capacity of not exceeding 80 by 80 mm. variable gear allowed.—1, R. Moore, 3½-h.p. Phelon and Moore, 0; 2, F. G. Galley, 2½-h.p. Anglian, 1 min. 33 4-5 sec. Seven started; six finished, and four pedalled.

Class 2, for machines having a cylinder capacity not exceeding 85 by 85, or the equivalent volume swept out, variable gear not eligible.—1, 3½-h.p. Quadrant, ridden by B. Horne, 0; 2, 3½-h.p. Quadrant, ridden by T. Silver, 1-5 sec.; 3, 3½-h.p. Quadrant, ridden by Stanley Webb, 61-5 sec. There were 15 starters, and two failed.

task. The result, however, was eminently satisfactory, as six of the boats finished within four minutes of each other, while three others were close on their heels. On the handicap the cup was awarded to a 21 ft. boat fitted with a 3-h.p. two-cycle motor belonging to Mr. W. E. Gray, of Teignmouth, Banshee, a 21 ft. boat with a 6½-h.p. Brooke engine, being second by 1 min. 21 sec.

At a meeting of the House Committee on Saturday last, it was decided that unless a continuance of the fine weather and the number of members using the ship shall render a postponement of the date desirable, the greater portion of the staff shall be paid off on October 1st, and that the Enchantress shall go into winter commission. This will mean that the launch service will be suspended and that a number of cabins will be closed. The chief steward, the cook, and one deck hand will remain on board permanently, however, and every effort will be made to render the Enchantress as comfortable a floating home during the autumn and winter months as she has proved during the past summer.

### HEREFORDSHIRE.

THE Herefordshire Club held on the 8th inst. a most successful gymkhana at Canon-Frome Court by invitation of Col. and Mrs. Hopton. The day was perfect and there were over 200 present. Tea was provided on the lawn, and the contests were held on a course in the park just outside the garden. The band of the 1st Hereford Volunteers was in attendance. The first event (musical chairs) was won by the Rev. H. G. Morgan on his 12-h.p. Lanchester, with Miss Morgan as his

The Skegness Meeting.—The Start of Heat 2, Class B.

Class 3, for machines with twin-cylinder engines, size of each cylinder not to exceed 80 by 80 mm., variable gears not eligible.—1, 6-h.p. Riley, ridden by R. W. Ayton, 0; 2, 5-h.p. Vindec, ridden by W. H. Wells, 10 4-5 sec.; 3, 5-h.p. Rex, ridden by G. C. Lyle, 24 3-5 sec. There were eleven starters, and five failed.

Class 4, for machines with multi-cylinders, any size.—1, 5-h.p. Vindec, ridden by W. H. Wells, 0; 2, 5½-h.p. Brown, ridden by R. M. Brice, 4 3-5 sec.; 3, 7-h.p. Peugeot, ridden by H. N. Chilcott, 5 4-5 sec. Of the eight starters, only one failed.

Class 5, slow race.—This was won by J. Van Hooydonk, on a 3½-h.p. Phoenix, 10 min. 53 3-5 sec., F. G. Galley, on a 2½-h.p. Anglian, being second, and F. G. Tricks, on a 5-h.p. Kerry, third. The competitors had to go up as slowly as possible, without stopping or assisting the machine by pedals, the engine having to fire all the time. Seven started, and of these three failed.

Class 6, for fore-cars and side-carriages, and quad-cars carrying two passengers.—1, J. Browning, 9-h.p. Riley, 0; 2, Miss Muriel Hind, 9-h.p. Singer, 18 2-5 sec.; 3, J. F. Buckingham, 10-h.p. Lagonda, 19 sec.

### MOTOR YACHT.

THE cup presented by the Motor Yacht Club for competition at the Dartmouth Regatta attracted no fewer than 18 entries, and an excellent race resulted. Thirteen boats started and the first to finish was Badger, which it is interesting to note is fitted with the first four-cylinder petrol engine built by Messrs. Simpson, Strickland. The competing craft represented a wide variety of types, and ranged from a 14 ft. 2½-h.p. dinghy to the 35 ft. Cavancha, which is engaged with a 24-h.p. Craig Dorwald motor, so that the handicapper, Mr. Basil Joy, had a difficult

passenger, for which the prize was a motor-clock, presented by Messrs. Brown Bros., of London. The second place fell to Mr. Farrar-Roberts on his 10-12-h.p. Argyll, with Miss Farrar-Roberts as the passenger, the prize for this being an electric tail lamp and indicator given by the club. Event 2, passenger race, first prize handsome pair of silver candlesticks presented by Col. Hopton, was won by Capt. Inglefield on a 12-h.p. Darracq, and second prize, a silver sugar-box, given by Mrs. Hopton, was won by Mr. W. H. Banks on his 12 h.p. Lanchester. The last event proved most amusing. Each competitor had to drive to a blackboard and draw an animal on it, which had to be recognised by a lady waiting there before he could proceed. First prize, a pair of brass side lamps, presented by Messrs. Jos. Lucas, Limited, fell to Rev. H. G. Morgan, and Dr. Morris won a motor rug as second prize. The Motor Union medal for the most meritorious performance was awarded to Capt. Hughes Morgan on his 45-h.p. Daimler.

### SOUTHERN.

THE Southern Motor Club's second midnight run took place on Saturday and Sunday last to Broadstairs, at the invitation of two members to breakfast. The event proved even more successful than the first all-night run to Brighton. A start was made at 12 o'clock midnight from the clock tower, Lewisham, and a very pleasant ride through the silent towns and villages was experienced. A number of members staying in the Isle of Thanet for their holidays came over to Canterbury to meet the motorists from London. Only one car failed to reach the destination, and it was left behind in a shed ten miles from anywhere, its passengers being distributed over the other cars.

The following members took part in the ride:—Mr. and Mrs. Worger (Humber), Mr. Silverman and party (Siddeley), Mr. A. Clifford Earp and party (Iris), Mr. Nixon and party (Regal), Mr. Wall and party (Swift), Mr. Brown and party (Panhard), Mr. Philpott (Wolseley), Mr. Jackson (De Dion), Messrs. Harding and Fisher (tandem tricycle), Mr. Grottick (motor-cycle), Mr. Doughty, Mr. Lorkin, Mr. Vickers, Mr. Hill, Mr. Lloyd, Mr. Billing, Mr. Belcher and Mr. Philpott were among the company at Broadstairs to breakfast.

Many thanks are due to Mr. Dixon, of the Broadstairs motor garage, for his assistance in connection with the event.

The Manchester Motor Club's Hill-Climbing Competition.  
Mr. J. Newton's Fiat on the steep portion of Snake Hill.

#### YORKSHIRE.

THE Yorkshire Automobile Club have decided to hold their hill-climbing competition on Saturday, October 6th, instead of September 29th as previously arranged, by reason of the latter date clashing with the Isle of Man events.

#### MANCHESTER.

THE Manchester Motor Club held a hill-climbing competition on Snake Hill, near Glossop, on Saturday last. The twenty-three competitors were divided into five classes, and the handicap formula was: time in seconds, multiplied by horse-power, divided by combined weight of car and passengers—horse-power being calculated on diameter of cylinder in inches, multiplied by number of cylinders and divided by three. No times were, however, published. The results were as appended:—

**CLASS A** (for cars up to a value of £200).—Mr. R. Newton's 6-h.p. Rover (A. E. Bennett driver), 1st; Mr. W. McNell's 8-h.p. Cottereau (C. Kitchen driver), 2nd.

**CLASS B** (for cars up to £350).—Mr. Sawley Brown's 10-12-h.p. four-cylinder Humber (W. N. Jones driver), 1st; Mr. W. Fielding's 10-12-h.p. Humber, 2nd.

**CLASS C** (cars up to £500).—Mr. R. H. Carlisle's 16-20-h.p. Rover (F. J. Jenkins, driver), 1st; Mr. S. Beverley's 16-20-h.p. Humber, 2nd.

**CLASS D** (cars up to £750).—Mr. J. Arrowsmith's 20-h.p. Horbick (H. A. Cranham driver), 1st; Mr. F. Zorilla's 25-h.p. J.P. (C. Fletcher driver), 2nd; Mr. Newton's 24-40-h.p. Fiat (J. A. Bennett driver), 3rd.

**CLASS E** (cars over £750).—Mr. J. Higginson, jun.'s, 30-50-h.p. De la Buire, 1; Mr. J. Newton's 50-60-h.p. Fiat, 2.

An exciting incident took place during the afternoon, what might have been a serious accident being avoided by the presence of mind of Mr. C. Fletcher, who drove his J.P. car into the bog at the roadside in order to avoid a competitor who, disregarding the regulations, turned his car round on the narrow road. Fortunately, no serious damage was done.

THE North-East Lancashire Automobile Club has decided to give the crippled children of Accrington a half-day's run to the seaside on an early Saturday afternoon.

A WELL-ATTENDED meeting of Lincoln motor-cyclists was held on the 6th inst., when a proposal to form a motor-cycle club was adopted. Mr. A. W. Foster was elected chairman of the Provisional Committee. The first general meeting is to be held on the 26th inst.

## SOME REQUIREMENTS OF CARBURETTOR DESIGN.

BY E. T. BIRDSALL.

EVER since the idea of using a vaporized or gasified liquid fuel in the internal combustion engine was suggested, the device for preparing the fuel for use in the motor has been a subject for much thought and study. Numberless designers, more or less insufficiently armed with the proper experience, knowledge and data for the task, have undertaken to solve the problem, with varying results. As long as the principal requirement was to furnish fuel to engines working under a practically constant load and speed, and fuel was cheap, the defects of the early carburetors were not such as to interfere seriously with the operation of the engine. Other troubles, such, for example, as ignition, occupied so much of the operator's time, that the carburetor, so long as it worked at all, was neglected.

In the following remarks it is assumed that the engine used has a sufficient number of cylinders to produce a steady flow of mixture and that the carburetor is of the modern float feed type, with a petrol jet and main and auxiliary air inlets. The fuel is assumed to be petroleum spirit, although in the main alcohol or heavier oils require the same general conditions. The object to be attained is a mixture that will develop a maximum of power from a given size of motor with a minimum of fuel. With the use of the internal combustion engine under extreme variations of load and speed, as demanded by the modern automobile, with the perfection of the ignition and other features, and with the rapid rise in price of the lighter oils, the subject of carburetor design becomes one of great interest and importance. Again, in a few years, when the commercial motor vehicle will demand a low fuel cost combined with great certainty and flexibility of engine operation, the carburetor will probably determine the extent of the development of this, the most important branch of the automobile industry.

The function of a carburetor is to supply the proper mixture of air and fuel to the engine, under all conditions of speed and power. The four essential conditions under which carburetors must work are:—

First. Wide open throttle and high engine speed, as when climbing hills or running fast on the level.

Second. Wide open throttle and slow engine speed, as when travelling slowly on the high gear or picking up from standstill.

Third. Partly closed throttle and high engine speed, as when running fast down hill or on a low gear.

Fourth. Nearly closed throttle and low engine speed, as with engine running idle when car is standing.

For some time it was thought that the best carburetor was one that gave a constant mixture under all conditions. But we now know that a constant mixture is not the best from either the standpoint of good operation or fuel economy. It was also thought that the best mixture contained just sufficient oxygen to entirely consume the carbon and hydrogen. It was found, however, that a mixture with a slight excess of fuel gave the best results. These facts being demonstrated, it becomes almost obvious that the different engine speeds will demand different mixtures for maximum results. Thus, at slow speeds, the mixture should be richer than at high. This is due to the fact that at

Captain Hughes Morgan on his 45-h.p. Daimler which secured the Motor Union medal for the most meritorious performance at the Herefordshire Club's Gymkhana.

low speeds more heat is lost to the cylinder walls, more compression pressure is lost by leakage and the combustion can therefore be slower, thus sustaining the pressure. At high speeds the compression is higher, due to less leakage and less loss of heat. Therefore unless the leakage is leaner at high speed there may be danger of pre-ignition. A lean and highly compressed charge also burns faster, and hence gives better

\* Abstract of paper read before the American Society of Automobile Engineers.

pressures and fuel economy than a richer one. The quantity of mixture that an engine will take varies greatly with the speed. At slow speeds the quantity is equal to the cubic contents of the cylinders multiplied by the number of power strokes. At high speeds of one thousand revolutions and over the quantity may drop to less than one-half the theoretical amount, depending on the design of the valves, inlet piping and carburettor passages. This peculiarity reacts upon the compression, and hence on the mixture desired for best results. It will thus be seen that the design of the engine has a great deal to do with the carburettor design, which explains the well-known but seemingly mysterious fact that a carburettor that gives good results on one engine fails to maintain its reputation when applied to one of different construction. The design and class of ignition used have also a marked influence. Poorer mixtures can be used as the spark is hotter, the throttle can be more nearly closed, resulting in increased engine capacity and fuel economy.

To get the maximum power out of a given size of engine, the fuel should be introduced into the cylinders as cold as possible consistent with complete evaporation, intimacy of mixture and completeness of combustion. To provide for the heat absorbed by the evaporation of the fuel, hot air is drawn in to form the mixture, the entire apparatus is heated by means of hot water or the general heat of the engine compartment under a closed bonnet is relied upon. The adjustment of this heat is an important matter, but exact knowledge on the subject is apparently non-existent.

The ever varying density and compositions of the fuels used and obtainable introduce many and very serious complications into the problem. These differences demand different sizes of jets, float levels, amounts of heat to be supplied, and proportions of air for combustion. Different densities and temperatures of the fuel affect to a very appreciable extent the flow of the fuel from the jet. Between extremes this has been found to vary as much as 40 per cent. Owing to the absence of a ready means—like the pressure gauge on the water circulation, or the voltmeter on the accumulators—of ascertaining the quality of the mixture being delivered by a carburettor, the majority of the motors in use are operating under more or less disadvantageous conditions, even if carefully and properly regulated at the outset. The amount of reliable data and facts concerning the action of air and petrol in a carburettor at the command of designers and students is remarkably small. Of no other part of the automobile is so little known. What is badly needed is a series of carefully planned and exhaustive experiments with data so arranged that it can be analysed and deductions made.

### ROAD REPORTS.

**LANCASHIRE.**—Reporting upon dust-laying experiments which he has recently been conducting with oil-tar, Mr. H. Burrows, surveyor to the Lathom and Burscough Council, states that they have been a complete success. A better result was obtained by not sweeping the road before applying the tar, the dust appearing to absorb the fluid and form a kind of protective carpet which deadened the sound of passing vehicles and preserved the surface from abrasion by horses' hoofs. His expectations had been more than realised, and it now only remained to watch what effect the winter traffic and weather would have on the road. One special advantage oil-tar possessed over the ordinary commercial dust-layers was that it was a perfect mud preventive during or after rain, whereas other liquids had the effect of softening the surface and turning the road so treated into a soft, sticky mud, which was anything but pleasant, and certainly destructive to the road, at any rate so far as keeping a perfect contour was concerned. Oil-tar certainly was a dust-layer that lasted, for at the termination of six weeks it was as good as when first applied. It also preserved the road from wear, as since it was first applied there had been no loose chippings, while the other portions of the road surface were covered. The last lot of the old cobbles on the road between Lea Gate and Kirkham is to go. Preparations are already being made for the widening of the road and laying with macadam. When this is finished the new road between Preston and Blackpool will be one of the best in Lancashire.

**PORLOCK HILL.**—There is a private road up Porlock Hill, for the use of which ls. has to be paid. It is a far better road than the public one, but there are two or three bad corners where a large car must be backed to get round. Care must be taken not to take the wrong turn when near the top or the motorist may get down to Porlock Weir and have to go all the way up again.

### PUBLIC MOTOR SERVICES.

*We shall be pleased to receive the published time tables, list of fares, etc., of Public Motor Services for notice in this column.*

MANY representations have been made by residents and local authorities in the neighbourhood of Hounslow as to the necessity for linking up the tramway and railway systems at Southall and Hounslow, there being at present no connexion whatever across the three miles of intervening country. The question of establishing a motor-omnibus service between the London and South-Western Railway station at Hounslow and the Great Western Railway station at Southall has now been considered, and a motor-omnibus service will shortly be installed.

THE Islington Borough Council has asked its neighbour of Shore-ditch whether any annoyance was being experienced in the borough from

motor traffic, and whether the council would appoint representatives to attend a conference with the view of joint action being taken to promote legislation for the control of the motor traffic of London. This has been referred to a committee.

THE London District Motor 'Bus Company (Limited), the owners of the "Arrow" motor-buses, have been sued in the City of London Court by a carman named Callcott, for £50 damages done to his horse and van in a collision in Fulham Road. The motor-bus, coming along, it was alleged, on its wrong side of the road, ran into the plaintiff's van and then dashed on to a lamp-post. Mr. E. Carpenter, for the company, said that the motor-bus skidded owing to the greasy state of the road. Mr. Frank Dodd, for the plaintiff, said the defendants must take as much care of a motor-bus as the owner of a wild animal had to do, knowing its propensities. If motor-buses were run under statutory powers, like railway trains, it might be different. The Motor-bus Acts of Parliament simply removed previous disabilities but did not give statutory authority. That was a great difference. Defendants' driver and conductor said they were going slowly and cautiously, but, owing to the state of the road, motor-buses were skidding all over the place. The bus in question had skidded before. Judge Rentoul held that the defendants were

Views on the Vanderbilt Cup Course. 1.—Blind turn at finish, junction of Jericho Pike and Mineola Avenue. 2.—Mineola Level Crossing and site of Grand Stand.

[Motor World, New York.]

liable, and expressed the view that motor-buses in London generally went a great deal too fast. He awarded the plaintiff £13 and costs.

A MOTOR-BUS service between Chichester and Summersdale has been started.

THE Associated Omnibus Company started a new service of motor-omnibuses from Finsbury Park Station to Victoria Station, S.W., on Monday last.

### NEW COMPANIES REGISTERED.

**PEEBLES MOTOR COMPANY.**—Capital, £10,000. Tweed Green Motor Works, Peebles.

**AUTO-GARAGE AND AUTO-CABS COMPANY.**—Capital, £22,750. To acquire the business carried on by C. Loukatis, at Cairo, and to carry on the business of garage proprietors, &c. First directors: His Highness Prince Aziz Pacha Hassan, T. N. Corressy-Korressios, E. Manusardi, J. S. Gali, C. Loukatis, E. Buccianti, and N. Chakour Bey. 37, St. Mary Axe, E.C.

**D. NAPIER AND SON.**—Capital, £5,000. To take over the business of engineers and motor-car manufacturers carried on by D. Napier

and Son. No initial public issue. M. S. Napier is first governing director.

**SIMPLEX PNEUMATIC HUB SYNDICATE.**—£2,008. To adopt an agreement with P. C. Middleton, W. S. H. Smith, P. B. Cow, sen., and others for the acquisition of a certain invention, patent, and other rights and property, and to carry on the business of pneumatic hub manufacturers.

**ACER, LTD.**—£10,000. To adopt a certain agreement for the acquisition of the business carried on at Grosvenor Road, Ealing, and elsewhere, as H. E. Lewis, and to carry on the business of manufacturers of and dealers in, the letters to hire of motor-cars, motors, and vehicles of all kinds, &c. Registered office, the Motor Works, Grosvenor Road, Hanwell.

**VICI MOTORS.**—£5,000. Manufacture and deal in all kinds of vehicles propelled by steam, electricity, oil, or otherwise, &c. First directors: R. Lascelles, W. K. Perrens, and W. Ward. Registered offices, 64, Salusbury Road, W., Kilburn, N.W.

**DUSTROY, LTD.**—£20,000. To acquire any patents, rights, and concessions relating to paving and road-making, &c.

**DUSTLESS AND NON-SLIP ROAD MANUFACTURING COMPANY.**—£100. Objects and all other particulars as in "Dustroy, Ltd."

### CASES AGAINST MOTORISTS.

**JAMES MACKRIDGE**, of Highwood Hill, Mill Hill, N.W., has been summoned by the police for driving a motor-car at a rate exceeding the limit of twenty miles an hour. In support of the summons it was said that police-constables Pye and Gatley on the 19th ult. timed a motor-car which was being driven along St. George's Road, Southwark, and found that it covered a measured furlong in 18 seconds, equal to a rate of slightly over twenty-five miles an hour. The defendant said he had been driving for the last six years, and knew exactly what he was doing. The car was nearly seven years old, and would not go more than twenty-five miles an hour on a good straight road. He was not going more than sixteen miles an hour. Mr. Hopkins ordered the defendant to pay a penalty of 40s. and 2s. costs.

**AT Heywood**, Edwin Fearnside, of Trinity Street, Bury, was summoned for driving a motor-lorry along Bury New Road at an excessive speed. A constable said that the motor, which had a heavy load of cloth, was going down Prettywood Brow at about fifteen miles an hour. When he saw the defendant later, at the yard in Bury, he said that a lever had been touched and the engine "knocked out of gear." Whatever had been in the way, he could not have stopped the car; he would have had to run into it. The car was licensed to run at a speed not exceeding five miles an hour. The Bench inflicted a fine of £1 and costs, Mr. Alderman Firth remarking that these things were getting very dangerous in the country. On roads where there were steep gradients motor drivers should be prepared for them.

Two cases in which motorists were charged with having driven at a speed dangerous to the public have been heard at Scarborough. It was stated by witnesses that Alfred Newington drove a car down a decline in the North Marine Road, on the night of August 23rd, at a terrific speed. Defendant did not appear, and Mr. John Whitfield, who represented him, explained that his client was in the employ of a London firm of motor-car owners, from whom he received instructions to motor round the Lake district with a lady and gentleman. A fine of £2, including costs, was imposed. In the second case evidence was given that Charles Sturley drove a motor-car along St. Nicholas Cliff "like a whirlwind." Dozens of people who were leaving the Spa had to run out of the way. Defendant, who failed to put in an appearance, was fined £3, including costs.

**MR. WILLIE LEWIS JONES**, of Harlesden, was summoned at Aylesbury on Saturday, for driving his motor-car backwards for an unreasonable distance. Defendant drove his car backwards from the Market Square, Aylesbury, to the centre of Kingsbury Square, a distance of 108 yards. The streets were crowded at the time, and it was just getting dusk. The chairman (Mr. Walter Hazell) remarked that defendant, who did not appear, appeared to have treated the court with contempt, and he would be fined £3, including costs.

**HENRY BLACKBURN**, chauffeur to Miss Edna May, and John William Norketh, driver to Mr. Oscar Lewishon, were summoned at Cromer on Monday for driving to the danger of the public between Cromer and Overstrand. Inspector Clipperton was driving to Overstrand when he met the two cars travelling at what he considered to be twenty-five miles an hour. Neither man took any notice of his signals to stop. Blackburn was fined £20 and costs and Norketh £10 and costs, or, in default, one month. Both drivers' licences were suspended for twelve months.

**AT Arundel** a number of motorists were summoned for exceeding the speed limit, the fines ranging from £2 to £6.

### POLICE TRAPS.

**A POLICE TRAP** 220 yards long is in operation at Penybont, Radnorshire. All cars are being timed and several drivers have already been fined for exceeding the limit.

**AT Tabley**, near Knutsford, the police have a measured distance of 3½ miles.

The police are extremely watchful on the by-roads in the Walton, Hersham and Byfleet districts.

### MOTOR-CAR ACCIDENTS.

**A SERIOUS** motor smash has occurred at Shelton, near Shrewsbury, four persons having miraculous escapes. Colonel Finlan, of Dublin, was driving a car, accompanied by his wife and chauffeur, when, after negotiating a sharp turn, he came into violent collision with a farmer's cart, the occupant of which was hurled to the ground and sustained serious injuries. The motor-car dashed across the road into a telegraph pole. Mrs. Finlan was thrown out, but escaped with bruises.

**A MOTOR-CAR** belonging to a Liverpool firm collided on Llandudno Promenade with a landau. Though both vehicles were badly damaged the passengers escaped practically unhurt.

**MR. MURRAY JONES**, Hampton Hall, Malpas, has died as a result of a motor-car collision in Cumberland. His car overturned, pinning him to the ground.

**A POWERFUL** motor-car, the property of Mr. A. E. Bainbridge, of Newcastle-on-Tyne, was proceeding along the Huntingdon road, a few miles out of Cambridge, on Monday morning, when it collided with a loaded wagon. The three passengers, as well as the chauffeur, were pitched over the hedge into the adjoining field; the driver was so severely injured that he was detained at Addenbrooke's Hospital, but the other occupants of the car escaped with a few cuts and bruises. Immediately after the collision the car caught fire and was practically destroyed.

**AT an inquest** at Accrington on the body of Allen Fletcher Pierce, aged six, son of an Accrington upholsterer, it was stated that the lad ran out of a garden right in front of a motor-car, he being run over and the back of his skull completely smashed. Mr. Crabtree, of Clitheroe, the owner of the car, and the deceased's parents, were legally represented at the inquest. The coroner, however, said that it was a pure accident, and that no one was to blame. A verdict of "Accidental death" was returned.

**THE Mayor and Mayoress** of Chester (Alderman Robert and Mrs. Lamb) were injured in a motor-car accident on Saturday. The Mayor, who drives his own vehicle, was avoiding a cart in Hoole Road, not far from his residence, when the car skidded and overturned. The mayor sustained a severe shaking, but Mrs. Lamb was rather seriously injured, one of her ribs being fractured.

**WHILE** a motor-car was travelling along the Carlisle road, near Larkhall, on Sunday, it overturned, and its four occupants were thrown out. Mr. Watson, of Hamilton, the owner, was badly hurt about the head, the chauffeur had his arm broken, and the others were more or less injured.

### CASES DISMISSED.

**At the Lorrha** (Co. Tipperary) Petty Sessions, Mr. Charles Seagrave has been charged with having driven a motor-car negligently and at a reckless and excessive speed, on July 24th last. Mr. Stoney deposed that on that date he was driving towards Birr, when defendant's motor-car came round a turn at about twenty miles an hour, and stopped just at the horse's head. He heard no horn blown. The defendant said the car was going only ten miles an hour, and was stopped dead the moment he saw the horse. Mr. Stoney's car was on the wrong side. The case was dismissed.

**AT Reigate**, on Saturday, J. S. D. Barrington, of London, was summoned for driving his motor-car at Sidlow to the danger of the public. Inspector Jarrett said defendant drove his car at a murderous rate along the Brighton road. The lowest estimate of the rate defendant was proceeding as he passed another car was thirty-five miles an hour. Mr. G. L. Patten, who defended, denied the inspector's allegations, and called witnesses who stated that, owing to a breakdown of one of the cylinders, defendant was not travelling more than sixteen to seventeen miles an hour. The case was dismissed.

**AT the Arundel Borough Bench**, Albert Billing, chauffeur to Lord Chelsea, was summoned for exceeding the limit on August 2nd, at Arundel. Mr. F. J. Smith, solicitor, of London, appeared, and stated that he had been sent down by Lord Chelsea to defend the case. He was prepared with technical evidence to prove that the defendant was not exceeding the limit. P.C. Alce said he timed the car which the defendant was driving and found that it was going at twenty-seven miles and some odd yards an hour. P.C.'s Ayling, Etherton, and Dinnage corroborated, and Frederick Jessop spoke to the accuracy of the watches. Defendant gave evidence, stating that the car was fitted with the best speedometer that could be got. On the day he was stopped the maximum which the speedometer showed was fifteen miles. The Chairman said the Bench considered there was a doubt, and they gave the defendant the benefit of it; but at the same time they cast no reflection on the police.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

# THE Motor-Car Journal.

LONDON, SATURDAY, SEPTEMBER 22, 1906.

[No. 394.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## M.C.J. PRIZE COMPETITIONS.

### MOTORING EXPERIENCES.

IN consequence of the number of Motoring Experiences received being greater than had been anticipated we are compelled to hold over the award till our next issue.

### AUTOMOBILE PHOTOGRAPHS.

Three prizes are being offered—one of a guinea and two of half a guinea—for the best photograph in which a motor-car figures. In making the award regard will be paid to the public interest of the picture, as well as to its artistic merits; hence, photographs of cars outside historic buildings or monuments will be as welcome as those of vehicles in pleasant places.

Only original photographs may be submitted, the copyright of which belongs to the competitor. The winning photographs will be published in the *M.C.J.*, and the Editor reserves the right to reproduce, without payment, a selection of those not successful in the competition. The latest date for receiving photographs will be Saturday, the 29th inst. Envelopes must be marked "Competition" in the top left-hand corner.

## COMMENTS.

### The late Mrs. Estcourt.

WE regret, and the news will be received with sadness by a large number of motorists, to hear of the death of Mrs. Estcourt, the wife of Mr. Ernest Estcourt, of Wroxham, Norfolk. The deceased lady had been in a poor state of health for some time, and latterly she had not often been present at automobile gatherings. But in the early days of the pastime she and her husband were popular members of the meets organised by the A.C.G.B.I. when that organisation had its headquarters in Whitehall Court. Long before motoring became a fashionable means of travel Mrs. Estcourt was in the ranks of motorists, and her death leaves a wide circle of sorrowing friends, on whose behalf we may tender respectful condolence to Mr. Estcourt and his family.

### At Scarborough.

TO-DAY (Saturday) there will be a great gathering of motorists at Scarborough. A garden party will be given in the afternoon by the Earl and Countess of Lonsborough, at Lonsborough Lodge, to which members and their friends are invited, and the sixth Motor Union Provincial Dinner will be held at the Grand Hotel in the evening. Lord Wenlock will preside, supported by the Mayor of Scarborough, the Hon. Arthur Stanley, M.P., Mr. Walter Rea, M.P., and other public men. The business part of the meet will take place in the morning, the General Committee meeting at the Town Hall, where they will be officially welcomed by the Mayor (Alderman Hastings Fowler). In the meantime many members will avail themselves of the opportunity of driving through the beautiful Forge Valley. Those who wish to play golf will have the opportunity over an excellent course, as the Scarborough Golf Club have elected members of the Union honorary members of the Club for the Saturday and Sunday. The course is situated at Ganton,

on the road to York, about seven miles out from Scarborough. Among the matters to be reported to the General Committee at Scarborough will be the affiliation of the following new clubs:—Blackpool and Fylde District, Cambridgeshire and Isle of Ely, Crystal Palace A.C., Naval Motor Club, New Forest and Bournemouth, and the Shropshire A.C. At the March meeting of the General Committee a sub-committee was appointed to draw up a standard form of agreement for the purchase of a motor-car. Several meetings of the sub-committee have since been held, at which draft agreements have been prepared and considered, and at the meeting of the General Committee at Scarborough an agreement will be presented which, it is believed, will be of general service to the buyers and sellers of motor vehicles. Altogether the Scarborough meet will be as important as it will be interesting.

### Technical Instruction.

A YEAR ago we published an important contribution encouraging directors of technical colleges and similar institutes to include the teaching of automobile design and construction in their curriculum. The attention drawn to the matter, and the information then given, served to convince many educational committees of the advisability of starting motor classes. Most of them proved popular, and we note with satisfaction that considerable extension in that direction will take place this coming winter. The Heriot Watt College, Edinburgh, as well as the technical colleges of Manchester and Bradford, will have their classes. The Higher Education Committee of the Sunderland Education Authority has recommended the purchase of a petrol motor for instruction, and several of the principals of London institutes have sent their syllabuses, in which the automobile has a conspicuous place. At the Battersea Polytechnic—a pioneer in this useful work—practical lessons are given in driving as well as in the theory of automobilism, and the syllabus of the Northampton Institute in Clerkenwell is also of a practical character. Doubtless the A.C.G.B.I. will recognise in these educational institutions excellent opportunities of popularising their examination scheme.

### Motor 'Bus Regulations.

THE licensing of motor vehicles intended to ply for hire in the public streets is being undertaken by the New Scotland Yard authorities in a very strict sense, and we hear of some 'buses the appearance of which in public has been delayed owing to the action of the police. There is, therefore, considerable point in the introductory paragraph of the proposed police regulations which says that "proprietors before entering into contracts for new types of motor-omnibuses would do well to send the drawings to New Scotland Yard for approval as to type." In future the routes along which motor-buses are to ply will have to be specified when application is made for licences—evidently an endeavour to regulate the traffic in the interests of the residents of streets that are now quiet and undisturbed but threatened with the coming of the 'bus. "No undue noise or vibration is to be allowed," oil from the bearings must not drop on to the roadway, the visible exhaust is to be eliminated, brakes

are to be perfectly maintained and the regulations, as a whole, point to a general advance in the construction of such vehicles. The chassis wheel base should not exceed 14 ft. 6 in., and so proportioned that skidding and "other improper movements" shall be as far as possible avoided. In connection with this provision the Commissioner reserves the right, even after a bus has been passed, to call upon the proprietor not to use it if it is found to skid unduly. The new regulations which have been issued are still under consideration by the Commissioner before coming into force, and he is listening to the representations of the proprietors upon some of the details. Already he has made a concession with regard to the clause relating to advertisements, and we trust he will have something to say as to the height of the rear steps from the ground. The want of uniformity in this respect is a real danger to the public.

Dr. C. H. Roberts, at the wheel of his Germain 14-22-h.p. chassisless Car. The vehicle is fitted with a special body by Meier, of Redhill.

#### Universal Lights.

ALTHOUGH the Bill to secure the universal lighting of vehicles did not secure Parliamentary sanction, the necessity for its operation remains as strong as ever; in fact, the darkening evenings that seem to have come so suddenly upon us afford ample evidence of the need for all vehicles travelling upon the road to be adequately illuminated if something of safety is to be secured to the public highway. Elsewhere in our present issue is a report of a trial held by the Essex Club last Saturday. On returning home an accident befel one of the members which would certainly not have occurred had the suggested regulation with regard to the lighting of vehicles been enforced. Such mishaps should be reported to local M.P.'s with a view of convincing them with regard to the present inadequate protection which is afforded to users of the road.

#### Slovenly Drivers.

WE heartily associate ourselves with the protest raised by Major Lindsay Lloyd against the slovenly attitude adopted by many chauffeurs, who seem to regard the driving seat as a kind of lounge whereon they can disport themselves with an easy nonchalance, regardless of appearance or dignity. The driver observed by Major Lloyd "in a smart white coat, with his head almost touching the back of his seat, his right foot halfway up the dashboard, and his whole attitude more that of a slovenly drunkard than of—a driver," is but typical of many, and the protest against such slackness comes

not a day too soon. Such practices would not be tolerated on a carriage drawn by horses; why they should be regarded with equanimity on a motor-car is a thing that we, in common with Major Lloyd, cannot understand. The point might be emphasized by those responsible for the A.C.G.B.I. examinations.

#### The Tourist Trophy.

NEXT week many motorists will wend their way to the Isle of Man to see the International Tourist Trophy Race over the shortened course that has been selected by the Club. During the past few days many of the competitors have been grumbling at the bad condition of the Manx roads, saying that they are too lumpy for fast driving. The roads chosen this year, especially that from Douglas to Peel, are those with the greatest traffic upon them during the "season." It is indeed, surprising to many local people that the roads are as good as they are. Of course the surface could be improved, but this would cost a large amount of money, and the Highway Board have none to spare. It is, however, urged that the competition is meant for ordinary touring cars, and if they cannot stand the strain of rough roads they can hardly claim to be really touring cars.

#### A Warning to Motorists.

THE persons injured in the motor-car accident which befell Dr. Wolfington's party between Bala and Lake Vyrnwy last week are progressing well. In conversation with a correspondent Dr. Wolfington would like it to be known that, in his opinion, it is folly to take a car of any weight from Bala to Lake Vyrnwy by that road, and motorists should be warned against it. The road is in reality not a road, but a rough track of loose shingle and stones, and just wide enough to be traversed by a car. For five miles or so it ascends the Berwyn range through perhaps the most desolate but grandest scenery in Wales, until it reaches one of the highest eminences of the Berwyns. Then it descends by a series of steep slopes to Lake Vyrnwy. It was on one of these slopes, unbounded by hedge or bank, with the mountain rising sheer off the road on the left and descending steeply for half a mile to the valley below on the right, that the accident occurred. Coming down this rugged path the car gradually went to pieces, the front wheel coming off and the back wheels crumpling up.

#### The Responsibilities of Authorities.

WITH regard to the maintainance of roads by local authorities it must be recognised that they frequently fail in their duty, and many have been the accidents resulting from the neglect of the surveyors and their councils. It would be interesting to have a clear statement of their legal responsibility in the matter, and with this object in view some of the associations connected with motoring might undertake to fight a test case before the courts. The effect of such a policy would undoubtedly be a good one, inciting negligent road authorities to take steps to bring their highways to a safe condition—a state which cannot be claimed for many of them at the present time.

#### Scottish Neglect.

NOT only do the authorities neglect their obvious duties with regard to the condition of the roads, but some seem to delight in such wanton omission to safeguard the public. A meeting of the Upper Ward District Committee of the Lanark County Council has been held in the County Hall, Lanark, when a letter was read from the county clerk regarding the suggestion of the chief constable to have boards placed on the motor danger poles stating the nature of the danger to be expected. It was agreed to leave the letter on the table. Apparently considerations of economy prevented the adoption

of the suggestion, as well as a proposal to provide a more plentiful supply of danger signals.

#### The Accident at Hounslow.

AMONG our Royal family the Duke and Duchess of Connaught have had a succession of motoring mishaps such as, in a more superstitious age, would probably have caused them to publicly renounce the use of the mechanical vehicle on ordinary roads. The Duke has been concerned in two mishaps, and the Duchess, on Friday of last week, had an experience of a very shocking character, a lad dying from the results of injuries received by being knocked down by a car in which Her Royal Highness was riding with members of her family. The car was being carefully driven from Bagshot to London. When passing through Hounslow it got behind a cart, on the back of which some lads were hanging. One of these suddenly released his hold, apparently with the intention of running towards the pavement. He was, however, struck by the off-side head lamp of the slowly-advancing car, and, although every care was given, died during the evening. Such an accident should afford the Motor Union another opportunity of directing the attention of schoolmasters to the necessity of impressing

revive Shakespeare and throw physic (not the doctors necessarily) to the dogs, preferring to motor towards health than be drugged into perpetual somnolence.

#### Carriage Builders in Conference.

CARRIAGE builders have been comparing notes at Leamington, where the annual meeting of their Institute has been held under the presidency of Lieut.-Colonel A. F. Mulliner, of Northampton. It was notable of the change that is coming over the country that, after the first morning's session they proceeded to Coventry for an inspection of the works of the Daimler Motor Company. The President, in his address, said a change had taken place in their industry since he left his home thirty years ago to learn the practical details of the coach-builder's art. The mechanical spirit of this age of invention had drawn their attention to mechanically-propelled carriages, and in many firms this branch absorbed the greater part of their attention. The change was not only in respect of the type and design of the vehicles produced. Some firms who at first were interested solely in the building of chassis, not being able to obtain to their full satisfaction, or at prices they were prepared to pay, the carriage work they required, had

The Mont Ventoux Hill-Climbing Competition.—A Miesusset Car nearing the summit. (See page 623.)

upon the minds of children the dangers of carelessness on the public road.

#### Another Medical Scare.

THE late Sir Henry Thompson, one of the first medical men to adopt the motor, would probably have given a spirited reply to the attack—we can find no other word to describe the address—which Sir James Crichton-Browne has made on motoring at Blackpool. According to this latest utterance on the subject, rapid locomotion is a craze, involving blindness to natural beauty; motoring being in relation to scenery what bolting is in relation to food. The flavour is missed in both cases and indigestion results, mental dyspepsia in the one case, stomachic dyspepsia in the other. The confirmed motorist must, Sir James thinks, become sluggish in intellect and excitable and jumpy in temper, with an incessant craving for stronger and still stronger condiments. Motoring, at its worst, he decides, tends towards homicidal mania. Altogether this medical expert would probably class motoring with tea drinking and other evils of the age which—again we refer to the medical folks who scare us now and again and try to starve us into healthy bodies and sane minds—are modern innovations that spell disaster to poor humanity. In such extremity we would

taken their own measures to build or obtain it for themselves, with the result that work which they might legitimately have claimed had been diverted from them. He went on to touch upon the question of "prime cost" in relation to motor carriage body work, and concluded with a plea for greater confidence and mutual assistance between the members of the institute, and, indeed, between all engaged in the industry, whether employers or employed.

#### Experiments.

THE opportunity of gauging the respective merits of a dozen of the anti-dust preparations now before the public within a short distance of each other is about to be presented on the Portsmouth road. Ordinary constructional methods, supplemented with tar painting and laying with some of the patented compositions, will exist within reach of stretches of slag, ragstone and Kleinpflaster, the latter having a great reputation in Germany. The new experiment is being devised by the joint efforts of the Automobile Mutual Protection Association, the Roads Improvement Association, and the Surrey Council. The latter body deserves the thanks of motorists for rendering the experiments possible in sufficient time to give useful lessons to the road authorities for next season.

## THE TOURIST TROPHY RACE.

**T**UESDAY morning next will see the gathering of the cars engaged in the Tourist Trophy Race in the Club Enclosure in the Alexandra Drive, Douglas. Cars arriving after 10 a.m. will be disqualified. Already practically all the competitors have notified the Club of the fuel they intend to use—Shell, Pratt's, Carless, and Carburine having each its adherents. The three or four that have omitted to do this will be supplied with a spirit by the A.C.G.B.I. having a specific gravity of 0.695 to 0.705 at 60 deg. Fahr.

The race will commence on Thursday next, at 9 a.m., over a course about forty miles in length, *via* Quarter Bridge, Union Mills, Peel, Kirkmichael, Ballaugh, Sulby, Ramsey, Mountain Road, and Douglas. The cars will be required to make four complete circuits, making a total distance of about 160 miles, and the speed must be reasonably reduced in passing through villages and at other points, which will be marked at the beginning by a red flag and marked at the exit also by a red flag. No car must under any circumstances pass another in a village or between other distances marked by the red flags, unless the car passed is in obvious difficulties or is, in the opinion of other competitors, going at such a speed as unreasonably hinders them. The Club will have Observers in each of the

[Fig 1.—The Peugeot Car with Mr. Guy Lewin at the wheel.

villages, and at other flagged portions of the course. Official cars will also pass round the course during the race, Mr. Frederic Coleman having lent the Club a team of White steam cars for the conveyance of Observers and others.

### The Peugeot Car.

In the illustration (Fig. 1), Mr. Guy Lewin is seen at the wheel of the Peugeot car he has entered on behalf of Messrs. Friswell, Ltd., for the Tourist Trophy event. While, generally speaking, it follows the lines of the standard 10-12-h.p. Peugeot, the vehicle comprises a number of special features, chief among which is the engine, which is of a new design, comprising two cylinders 125 mm. bore by 140 mm. stroke, and with the valves all mechanically actuated off a single cam shaft. Two systems of high tension ignition are provided—accumulators and magneto. The engine is governed on the throttle, which is also controlled by a lever on the steering wheel. A device for agitating the carburettor, either from the driving seat or the front of the radiator, is fitted. A half-compression device is also provided, and another noteworthy point is the provision of a lever to regulate the intake of hot air to the carburettor. The

transmission is through a leather-faced cone clutch to a gear-box giving four speeds and a reverse, and thence by side chains to the rear road wheels.

### The Speedwell Car

The Speedwell car which has recently been specially built for the race by the New Speedwell Motor Company, Ltd., is

Fig. 2.—The Speedwell Car and its driver, Mr. L. Braithwaite.]—

shown in Fig. 2, Mr. M. L. Braithwaite, who will pilot the car in the contest, being seen at the wheel. The engine, which is of 16-h.p. and comprises four cylinders, is fitted with a specially designed automatic carburettor, which, we understand, is exceedingly economical as regards fuel consumption. A disc clutch is employed and the change-speed gear is arranged to give three forward speeds with direct drive on top. The transmission is by means of a cardan shaft and bevel gear on to a live axle, while the road wheels are 810 mm. diameter and shod with 90 mm. tyres.

### The Arrol-Johnston Cars.

The New Arrol-Johnston Car Company, Ltd., are running two cars. One will be driven by Mr. John S. Napier, the

Fig 3.—The Arrol-Johnston Car which Mr. E. Campbell Muir will drive.

winner of the 1905 event, and the other by Mr. E. Campbell Muir (Fig. 3) giving a view of the latter vehicle. The two machines are practically alike as regards the chassis, but the bodies are somewhat different. The engine comprises two

\* LA = cardan shaft and live axle. SC = side chain drive.

horizontal cylinders, 4½ in. diameter by 6½ in. stroke, and developing 18-h.p. at a speed of 800 revolutions per minute. Ignition is by low-tension magneto, while the carburettor is arranged in a special way devised by Mr. Napier with the view of securing great economy in fuel consumption. The governor is arranged to act on the exhaust, while a hand-controlled throttle on the admission is also provided. The transmission is through a disc clutch to a gear-box giving four speeds and a reverse, and thence by cardan shaft and bevel gear to a live axle. The vehicles have a wheel base of 8 ft. 10 in.

## The Swift Car.

The 16-h.p. Swift car entered by the Swift Motor Company, Ltd., will be driven by Mr. R. Every, who is seen at the wheel in the illustration on page 621, and who, it may be added, drove the successful car of this make in the recent Scottish Reliability Trials. The Tourist Trophy vehicle is fitted with a four-cylinder engine 88 mm. bore by 130 mm. stroke, the normal speed being 1,100 revolutions per minute. Two forms of high-tension ignition—magneto and accumulators—are provided, while the mixture is furnished by a new design of carburettor. The clutch is of the leather-faced cone type, and the change-speed gear is adapted to give four speeds forward and a reverse, with direct drive on top. The final drive is by a cardan shaft and

bevel gear on to a live axle. The car has a wheel base of 8 ft. 6 in., and the road wheels are 810 mm. diameter shod with 90 mm. tyres.

## The Wolseley Cars.

The Wolseley Tool and Motor Car Company have entered two Siddeley cars for the event. The vehicles, which have been designed by Mr. A. A. Remington, will be driven respectively by Mr. M. Grahame White and Mr. A. E. Crowdy, the latter gentleman being seen at the wheel of the car shown in the photograph reproduced on page 624. The motive power is supplied by a four-cylinder engine 4 in. bore by 4 in. stroke, developing 18-h.p. at a speed of 1,000 revolutions per minute. Two systems of high-tension ignition—magneto and accumulators—are provided. No governor is fitted, the speed of the engine being controlled by a small lever on the steering wheel, which is connected up to a variable lift device fitted in conjunction with the inlet valves. The transmission is through a leather-faced cone clutch to the gear-box, and thence by side-chains to the rear road wheels. Four speeds forward and a reverse are controlled by a single lever working in a "gate." The car has a wheel base of 8 ft. 6 in. and a track of 4 ft. It will be noted from the illustration that wire road wheels have been adopted, these being 30 in. in diameter, and shod with 65 mm. tyres at the front and 90 mm. at the back.

## SOME CURRENT TOPICS.

### Fires due to the Ignition of Petrol.

According to a return which has just been issued thirty-five fires in which petroleum spirit was involved were investigated by the London County Council's inspectors during 1905, as compared with fifteen in the previous year. Twenty-five of the fires were in connection with motor-vehicles. While the outbreaks were, according to the report, mostly due, primarily, to defects in machinery allowing petrol to escape, the carelessness of chauffeurs in bringing dangerous artificial lights near the leaky parts is given as the immediate cause. Besides stringent conditions inserted in licences issued by the Council, notices in

the particular car on which it is used. Especially as regards the engine lubrication, there are several conditions which require careful consideration in the selection of the proper lubricant, one of the most important being the amount of heating which the motor is subject to. A good deal may also depend upon the condition of the water-circulating pump, and it is important that this should be maintained in proper order, and all the pipes kept clean, so that the motor may run at an approximately even temperature. The failure of the pump to keep up the required flow of water may cause the temperature of the engine to rise considerably, when the ordinary oil which has previously suited it well will become too thin. If pump troubles should arise, it is advisable to immediately obtain an oil somewhat heavier than that ordinarily employed, otherwise the lubrication of the engine will not be properly carried out. In cars which have pressure-fed lubricators there is less danger of the motor running short of oil, but it must be remembered that as the reservoir which receives the pressure,

Motor Touring in Carinthia.—At the foot of the Loibl Pass.

[Allgemeine Automobil Zeitung.]

three languages have been distributed to the owners of garages, indicating the principal precautions to be taken in dealing with petroleum spirit, and forbidding the dangerous practice of pouring waste spirit into the drains, which has been the cause of many accidents.

### The Importance of Efficient Lubrication.

Although in the abstract there can be little doubt that every owner and driver of a motor-car has in his mind the fact that all the working parts should be lubricated, there are but few who fully realise how important a part proper lubrication plays in the satisfactory running of an automobile, how many small troubles could be avoided, and how many unpleasant experiences could be eliminated, were more careful attention given to the subject. While in cases where only really high-grade brands are employed the argument may perhaps reasonably be advanced that one oil is practically as good as another, yet it will always be found advantageous to see that it actually suits

usually supplied from the exhaust, is common to all the pipes, if one or more become choked, it follows that an extra quantity of oil may be forced through other pipes to those parts which do not require an excess, whilst the parts fed by the choked pipes are badly in need of lubrication. Therefore, care should be taken to see that the pipes are periodically and fairly frequently cleaned by disconnecting them from the crank case, or the bearings to which they lead, and filling the oil reservoir with paraffin, which should pass freely through the pipes. Lack of oil is one of the most frequent causes of scored bushes and shafts, and it is generally to be noticed that a car the working parts of which are constantly requiring re-bushing has been neglected in the matter of lubrication, so that closer attention in this direction will not only improve the running of a car, but will assist in keeping the cost of upkeep at a minimum.

ON Tuesday the Willesden magistrates issued summonses against some boys for throwing stones at a motor-car.

# The Talbot 20-24-h.p. Car.

THE 20-24-h.p. Talbot car, which has made a successful debut in this season's competitions, differs from the other productions of the Clement-Talbot works at Ladbroke Grove, London, W., in that it is not merely of British manufacture throughout, but is an entirely fresh design, the other Talbot cars being, as our readers are aware, manufactured in accordance with the designs of the French Clement-Bayard car. The distinctive points in the English Talbot are the adoption of a multiple disc clutch and cardan shaft transmission, but in many minor ways variations are observable. The engine is of the four-cylinder type, with the cylinders cast separately, the bore being 100 mm. by 120 mm. stroke, and the normal crank 1,000 revs. per min. As will be seen from Fig. 2, the valves are arranged on opposite sides of the cylinders, and mechanically actuated off separate cam shafts. No automatic governor is provided on the motor, which is entirely controlled from the steering wheel. An interesting feature is the employ-

pipe fitting C, which is formed of four separate castings connected by expansion rings. The reason for this is that it has been found that the uneven expansion and contraction of a single-piece exhaust pipe fitting attached to the exhaust ports has a tendency to distort the cylinder from alignment. The crank case consists of two large aluminium castings bolted together on either side of the main bearings, as well as by short bolts around the outside joint. This not only provides bearings between each of the cranks but enables inspection doors to be fitted under each crank pin, as shown at E in Fig. 1. At the front end the main castings are formed in such a way as to constitute half of the case enclosing the cam shaft, pump, and magneto driving gear wheels. The manner of fitting the cam shafts is also worthy of notice. The upper half of the crank chamber is bored through on either side to enable the cam shafts with their bearings to be pushed into place from the front end, when they are held in place by a grub screw.

Figs. 1 and 2.—Longitudinal and Cross Sectional Views of Talbot 20-24-h.p. Motor.

ment of chrome vanadium steel for the crank shaft, which, as is shown in the illustration Fig. 1, is provided with a bearing between each cylinder. On each side of the front main bearing are ball thrust rings A, and beneath each of the connecting rods are placed small oil scoops B, formed of small pieces of piping, the rotation of the shaft tending to force the lubrication from the oil well into the "big end" bearings, the pipes also serving to hold the lower halves of the brasses in place. Horizontal ignition plugs are fitted, in addition to the ordinary vertical plugs passing through the walls of the inlet valves chambers, one set being used in conjunction with the high tension magneto ignition, the other for the ordinary accumulator and coil ignition. This is, undoubtedly, sound practice, as it is generally conceded that the one set of plugs for dual ignition is not altogether satisfactory, the plug necessary to work properly with a high tension magneto being different to that suitable for ordinary accumulator ignition. Another noticeable point about the Talbot engine is that any make of magneto can be fitted, for the shaft which drives it runs at the same speed as the crank shaft; but for those who desire the Simms-Bosch type a special reducing gear is fitted. Another feature to which attention may be drawn is the exhaust-

The construction of the cams F G and their push rods with their steel collars and small cushioning springs will be clearly understood from the drawings.

Passing now to the clutch (Fig. 3) this differs from other multiple disc clutches in that the discs are quite flat and the friction surfaces are comparatively small, the advantage claimed for the design being that it provides a quicker pick up and release. One set of discs is made of hardened steel, the other of tough steel plates. An extra set of narrow corrugated discs is introduced between these plates to provide separating pressure. The operation of the clutch will be seen from the drawing. The central portion of the fly-wheel T, which is bolted to the crank shaft V, forms the outer member Y of the clutch, while the spokes are vane shaped to act as a fan in drawing air through the radiator. The clutch is made oil containing by means of the casting W which is bolted to the main casting. In this way a bearing is obtained for supporting the clutch shaft K with its sliding member, obviating the necessity of an additional bearing between the engine and the gear-box. At its forward end the shaft K has a spigot or thimble bearing inside the crank shaft V, and is flanged to receive the disc drum Z. The discs

R are slotted to correspond with teeth projecting from the disc drum Z. Although free to move longitudinally they are thus compelled to revolve with the clutch shaft K. Interlacing with the inner discs are the outer discs S, which are threaded over eight equidistant pins X, secured in place between the castings W and Y. The helical spring O is introduced between the sliding member and a collar on the shaft K, in order to force all the discs closely together. The action, therefore, is that when the oil is forced out from between the discs the friction between the inner and outer sets is so great that

Fig. 3.—Section of Talbot Disc Clutch.

the clutch shaft K revolves with the flywheel. The sliding member at its rear end, which is outside the main body of the clutch, is provided with a thrust collar, and it is with this collar that the clutch pedal engages. In the illustration the sliding member is shown in the "free" position with the spring fully compressed and the discs separated by the corrugated discs. About one and a-half pints of oil comprises the full charge for the clutch, which can easily be dismantled without disturbing the gear-box.

MR. F. GASH has fitted up a garage at Douglas, with accommodation for half a dozen cars. Inquiries should be addressed to him at 7, Mona Terrace.

MR. W. J. ANDERSON, the motor agent, of Albert Bridge Road, Belfast, recently supplied a motor-car to the Irish "Daily Telegraph" for an extended advertising tour through the north of Ireland.

THE tabulated result of the replies to the circular of the Society of Motor Manufacturers and Traders in connection with the agency scheme was produced to the management committee at their last meeting, and this shows a decided majority in favour.

A FEATURE of several of the recent touring car trials on the Continent has been the increasing use of the Continental red-rubbered, steel-armoured, non-skid tyres. In the Coupe d'Auvergne contest, which was recently concluded, they were fitted to the winning car, a Brouhot, in class six. We may add that in this event six out of the first eleven cars were fitted with Continental tyres.

A SUBSTANTIAL reward is offered by Messrs. Daniells, Ltd., mineral water manufacturers, of Chertsey, to anyone giving information as to the number of a motor-car that passed over Chertsey Bridge about 8.30 p.m. on the 10th inst. The car met a mineral water van returning from a journey, and was steered violently into the latter, the driver being thrown from his elevated seat into the road, his horses bolting. The occupants of the car, which was apparently but little damaged, continued their journey at a rapid pace, and did not offer to render the slightest assistance.

## SOME USEFUL NOTES.

It not infrequently happens that the spattering of oil upon the gauze screen covering the main air inlet to the carburettor results in the accumulation of a film of dust which so cuts down the proportion of air to gas as to seriously interfere with the action of the motor. Care should therefore be taken to keep the gauze as clean as possible.

A CLOSE watch should be kept of the lubricator sight feeds of a car. If oil drops can be seen passing the motorist knows that oil is at least leaving the lubricator and going to some of the bearings, although he cannot be sure, from this indication alone, that all is right in the lubrication system, as there is always a possibility that a delivery tube may be broken or otherwise detached.

A PETROL motor does not develop its full power until it has been in operation a little time. When started the parts of the engine are cold, the cooling water is cold, the lubricating oil is more or less stiffened, a slight gumming of the cylinder walls and valves being quite common in cold weather until all parts have been heated. After a few minutes these factors disappear, and the motor resumes its wonted power, unless something else is amiss.

ACCUMULATOR terminals should always be kept scrupulously free from corrosion, otherwise they will gradually become "eaten away" to such an extent that a slight extra jolt on the road will suffice to break them off, and it may then be a matter of great difficulty to effect even a temporary connection. After being thoroughly cleaned and polished, the terminals may be fairly well protected from the action of the acid by a coating of vaseline.

A METAL pipe, if broken off, can be temporarily repaired by connecting the broken ends with rubber tubing or hose of the right size, and binding the ends tightly with wire or twine. A small leak may be stopped with tape, and a large one with a piece of patching rubber held down by tape. In making use of rubber cement, patching rubber, tyre tape, rubber tubing, or anything made of or containing rubber in any form, it should be borne in mind that rubber is soluble in petrol and will not hold it long.

The 30-40 h.p. Daimler built for the Hon. Mrs. Howard. The car, which has a 10 ft. wheel base, is fitted with a body of the "Warwick" type, painted dark blue with red lines and black mouldings.

IN addition to the float-controlled valve some carburettors are provided with needle valves in the spray nozzle or in the passage between the float chamber and the nozzle. Although these valves are generally very securely locked in position there is always a possibility of their having been tampered with, or the locking means having become ineffective through breakage and other causes, so that, should the carburettor not be functioning correctly, an inspection of these parts may usefully be included in the overhauling operation.

THE Douglas Bay Regatta will be held on Tuesday next, the day when cars for the Tourist Trophy have to be driven to the Club enclosure.

ABOUT a hundred men are now employed in the construction of the motor track on Mr. H. F. Locke-King's estate at Weybridge. At one point the river Wey is being diverted, so as to avoid bridging the stream oftener than necessary.

A CORRESPONDENT informs us that a royalty of £1 per car is being demanded for vehicles employing the "gate" controlled change-speed gear, and that the fee is being paid by several firms.

IN the recent trial of the Darracq-Serpollet motor-bus under supervision of the Scottish Automobile Club Gaulois tyres were used, and at the conclusion of the 688 miles' trial showed little sign of wear.

A MOTORIST who has just returned from Blackpool recommends Stretton House Boarding Establishment, North Shore, as a most comfortable place, and a useful address in view of the forthcoming races.

THE Alfred Street Motor Garage, opposite the Mitre Hotel, High Street, Oxford, have been appointed stockholders in the district for the Continental tyres.

THE Kansas City Automobile Club is adopting a shield placed on the front of the car as a means of mutual recognition, *a la* Automobile Association of the Old Country.

MESSRS. WILSON AND VOSS, Soroba Road, Oban, have been able to render useful assistance to motorists passing that way during the tourist season.

A MISPRINT in Mr. J. Ll. Warden Page's article "Under the Brecon Beacons and Through Mid-Wales," last week, made the descent from the top of the hill above the deep-wooded gorge of the Rheidol unusually steep. The gradient is, however, about 1 in 10, and can with due care be safely made.

There was a young man of Gomorrah,  
Who could not a motor-car borrow;  
He saw one marked Keele,  
Which he thought he would steal,  
He did, but 'twas much to his sorrow.

B. L. B., Bury.

At the annual general meeting of the Cyclists' Touring Club, held in London in March last, the idea was broached, and last week, at a special general meeting at Newcastle-on-Tyne, the proposals were made, and carried with only one dissentient vote, "That the name of the Club should henceforth be 'The Touring Club,'" and, following on this, "That all tourists should be admitted to membership." The Newcastle vote requires to be ratified at a further special meeting to be held in London next month.

At the meeting of Messrs. Vedrine and Co., the chairman, Mr. W. K. Steedman, said that they had on order 530 taximeter motor-cabs for London.

MR. G. F. PEDLEY, who is well known in motoring circles in London, was, on Tuesday, married to Miss Lilian Bennett, at St. Stephen's, Bayswater. The good wishes of Mr. Pedley's many friends may be assured.

MR. H. B. BROWNING, of Stonely Grange, Kimbolton, has offered to take any of the rabid anti-motorists who write to the papers for a ride on his car in order to demonstrate its controllability.

A NEW 10-12-h.p. car, known as the Pereire, has lately been put on the English market by Mr. Stanley Morris, of Doncaster. The vehicle, which is of French construction, is fitted with a four-cylinder engine and cardan shaft transmission.

MR. P. LAMB, who until recently was one of the partners in the firm of Messrs. Lamb Bros. and Garnett, has joined the firm of Messrs. West, Ltd., and in future his efforts will be centred in the sale of the "West" cars.

MR. BEERBOHM TREE has confessed to a Newcastle audience that "hooting and tooting through the landscape" was part of the joy of town-to-town visits.

THE eliminating contest for the American team for the Vanderbilt cup race takes place to-day (Saturday). There are fifteen competitors.

MESSRS. FRISWELL, LTD., inform us that they have sold the Peugeot car entered for the Tourist Trophy race to Mr. Sopwith, who will drive it in the coming contest.

MR. J. MACKAY TAYLOR, executive engineer, Ganges Canal, Meerut, India,

who has recently received delivery of a Jackson car from Messrs. R. Reynold Jackson and Co., writes that he has since used it under all sorts of weather conditions, both fair and foul, without an involuntary stop. He has run many miles along unmetalled grass and roughly-dressed canal banks, and has nothing but praise for the way it gets about.

AT an inquest held recently at Longtown, near Carlisle, on the body of Mr. Murray Jones, who was killed as the result of his car colliding with a cart on the Longtown road, the jury returned a verdict of death by misadventure, but recommended the County Council to pass a bye-law requiring carts in future to carry lights showing at the rear as well as in front.

A NUMBER of American motorists have organised an automobile tour of the Island of Jamaica, West Indies, leaving Boston on October 31st. One of the steamers of the United Fruit Company has been chartered exclusively for the party. The route will cover every interesting part of the island, the tour including admission to many of the private coffee, banana, and sugar-cane estates.

Mr. R. Every at the wheel of the Swift Car he will drive in the Tourist Trophy Race. (See page 617.)

IN High Chare, Chester-le-Street, Mr. O. Huntly has opened a motor garage.

MR. ST. JOHN HARMSWORTH, the victim of the unfortunate Hatfield motor accident, is progressing favourably.

WE illustrate herewith a little device which will be found exceedingly useful in motor garages, and which has lately been

put on the market by Messrs. Brown Bros., Ltd. It takes the form of a portable turn-table, and forms one of the latest additions to the "Duco" series of motor accessories. The apparatus consists of a pair of small trucks, each so

arranged that one of the front or rear wheels of a car fit into a steel concave in the centre of the same. The turn-tables are so substantially made that the heaviest car can be shifted about on them, and so easy is their movement that one man can handle them when in use.

A SCORING card in connection with the Touring Trophy race next week has been issued by the proprietors of Pratt's Motor Spirit.

THE Western Motor Company, Ltd., of which Mr. W. T. R. Shirrefs-Gordon is managing director, are offering free garage at their premises, 117-127, Berkeley Street, Glasgow.

A COLUMN of "Automobile Notes" now appears weekly in the "Sheffield Daily Independent," the first instalment of which makes apology for their strong resemblance to automobile notes elsewhere—a piece of surprising candour that does credit to the writer thereof.

TURNER'S Motor Manufacturing Company, Ltd., of Lever Street, Wolverhampton, is being reconstructed owing to the largely increased business, and has been registered with a capital of £50,000. The company has a large number of orders in hand at the present time.

FOR the convenience of those going to the Isle of Man attention may be drawn to the comfort of the London and North Western Railway Company's services *via* Liverpool and Fleetwood. An advantage which has been in operation all through this season, and which has been much appreciated by London and provincial passengers, lies in the ability to leave Euston by the 10.30 a.m. express and arrive at Douglas about 6.15 p.m. the same day.

ENTRIES for the "Graphic" Trophy Race closed on Saturday. The course is 4½ miles in length on the Douglas-Ballasalla road, starting from a point just south of the railway crossing at Quarter Bridge, Douglas, and running over Richmond Hill. The contestants will be Messrs. T. C. Pullinger (60-h.p. Beeston-Humber), Percival L. D. Perry (18-h.p. S.C.A.R.), J. Ernest Hutton (40-h.p. Berliet), George S. Barwick (30-40-h.p. Daimler), W. Watson (24-40-h.p. Berliet), F. W. Baily (50-h.p. Napier), H. E. Hall (28-35-h.p. Isotta-Fraschini), J. Ernest Hutton (50-h.p. Ariel-Simplex), H. P. MacConnell (20-h.p. Rapid), Percival D. Perry (30-35-h.p. Sorex), and Albert Farnell (30-h.p. Daimler).

A SIMPLE and ingenious arrangement for preventing the skidding of motor-buses is being introduced by the Motor House, of Euston Road, N.W. From the photograph of a model which has been sent us we notice that the device consists of two arms connected to the frame of the bus and a small length of steel chain. The front arm is brought out to the line of the near side back wheel, while the rear arm extends just beyond, the chain connecting the two arms lying on the inside of the wheel, curling round behind. As long as the rear wheels follow in the same track as those in front, the chain is out of action, but directly they tend to skid by swinging to one side or the other the wheel mounts the chain and obtains an enormous grip, which immediately arrests the side-slip. Under ordinary conditions the device is not in use, the chain being lifted off the ground and let down from time to time, as the surface of the road requires, by a lever at the side of the driver.

THE Peel Town Commissioners are delighted at the inclusion of the town in the Manx race, and have agreed to several alterations to meet the wishes of the A.C.G.B.I.

"DAS AUTOMOBIL UND DIE MODERNE TAKTIK" is the title of a new book, a copy of which has just reached us from Herr Paul List, of Leipzig. The work, which is from the pen of Herr K. A. Kuhn, deals exhaustively with the position of the motor-car in military service at the present time, the interest being increased by a large number of illustrations.

AMONG the prizes which will be competed for at the Blackpool motor races will be a 200-guinea cup, presented by the Blackpool Corporation, for the fastest flying kilometre; a 100-guinea cup, by Mr. A. Huntley Walker, for the fastest standing mile; and a 100-guinea cup, by Mr. A. Lee Guinness, for the light car section in the flying kilometre contest.

AN echo of the speedometer trials of the A.C.G.B.I. comes in the form of a circular letter from Messrs. Markt and Co., who have placed the Jones speedometer, which won the club's gold medal, upon the British market. The unfortunate error in the first report issued has had a long start, but Messrs. Markt and Co. are displaying natural persistence in acquainting motorists with the facts of the case.

THE new Granton double-deck bus, built by the Scottish Motor Engineering Company, Ltd., which recently made the journey from Edinburgh to London, arrived back at the works on Monday last, having made the journey from Walham Green in 37 hours, and on a consumption of only 80 gallons of petrol. During the round trip of about 800 miles the vehicle has given every satisfaction to the builders.

THE Adria Motor Agency, Ltd., which has recently been established at 8, Old Jewry, London, E.C., has acquired the sole agency in Great Britain and the colonies for the Radia cars, which, although well known in France, where they are built, have not hitherto been pushed in this country. Three models are being made, viz., 18-22-h.p., 30-35-h.p., and 40-45-h.p., all having four-cylinder engines. The general design of the cars is on Mercedes lines, the transmission being by side-chains, and the change-speed lever actuated by a lever working in a "gate" quadrant.

A NEW type of the Parsons Non-skid has been submitted to a thorough test on both light and heavy cars during the past six months with good results. The side hoops, instead of being made of wire and fastened with a right and left-hand thread

heavy coupling, are now made of chain and fastened with a simple but perfectly safe snap coupling. The cross chains, instead of being fixed zigzag across the tyre, now run straight across from hoop to hoop. These innovations secure greater facility of attachment and detachment, and reductions in weight and price. This pattern will be known as "Parsons Grippa" Non-skid, and is likely, judging from the result of experiments already made, to become popular with motorists.

## CONTINENTAL NOTES.

### The Mont Ventoux Hill-Climbing Competition.

The annual hill-climbing competition up Mont Ventoux, near Carpentras, organised by the Automobile Club Vaclusien, was held on Saturday and Sunday last. The hill is 21½ kilometres long, the difference of altitude between the starting and finishing points being about 5,200 ft. The first day was devoted to touring motor-cycles and two classes of touring cars. The best time of the day was made by Giuppone, who on a Griffon machine climbed the hill in 27 min. 58 sec., Champoiseau on an Alcyon being second in 30 min. 6 3-5 sec., and Cissac (Griffon) third in 33 min. 12 1-5 sec. The times were not equal to those recorded last year, when Ruamps on a Griffon covered the distance in 27 min. 9 sec. In the tri-car class the honours also fell to a Griffon, driven by Bucquet (1 h. 8 sec.). In the class for touring cars the chassis price of which is less than £360, Belleville on a 12-h.p. Brouhot with Continental tyres did 59 min. 8 1-5 sec. as against 1 h. 2 min. 45 3-5 sec. by Comanos on a 15-h.p. Cottereau. The section for cars of a chassis price of less than £560 brought out the largest number of competitors, the victory falling to Ladougue, who on a 20-25-h.p. Motobloc established

lunch given by the Vaucluse Club to the competitors at the hotel on the summit of the hill.

### A Screw-Propelled Motor-Bicycle.

Some experiments were made on the Acheres road last week with a novel motor-bicycle. The 6-h.p. engine transmitted its power, not to the rear wheel, as usual, but to a large screw fitted in front of the machine. The trial was organised by M. E. Archdeacon, the French aeronaut, his primary object being to test various forms of screw-propellers in order to determine which is best suited for airships and aeroplanes. Ridden by Anzani, the well-known motor-cyclist, the "aero bicycle" was timed to cover a kilometre in 45 2-5 sec, equal to a speed of about fifty miles an hour.

### Public Services in Germany.

A proposal is under consideration to start a public motor-car service between Baerl and Moers. The Bavarian Government is running a mail and passenger service between Southofen and Hindelang by means of a German Daimler single-deck bus and a trailing bus having accommodation for twenty passengers. A company has just been formed in Schlettstadt to establish a public motor-car service between that town and Markodsheim.

Collomb on the Rochet-Schneider Car on which he made the best Time in the Mont Ventoux Hill-Climbing Competition.  
*The picture is reproduced from a photo taken on the summit of the mountain.*

a new record, viz., 32 min. 25 sec., Gaste on an 18-22-h.p. Radia being second in 35 min. 59 sec., and Aubert (18-h.p. Mieusset) third in 40 min. 52 sec. The second day proved misty and very cold, with the result that the times were not equal to those recorded last year. Champoiseau riding an Alcyon made the best time in the racing motor-bicycle category, his time (26 min. 34 sec.) comparing with the 27 min. 10 4-5 sec. to the credit of Giuppone on a Griffon. Cissac (Griffon) climbed the hill in 26 min. 15 sec., but was disqualified owing to having been pushed round one of the nasty turns. Last year's record was 25 min. 48 1-5 sec., established by Lamberjack. In the touring car class for chasses under £800 victory went to the La Buire car driven by Mottard, the time being 25 min. 52 sec.; while in the under £1,000 section the winner was Taddeoli on a Rochet-Schneider (time, 25 min. 15 sec.), Garcet on a Clement-Bayard being second in 25 min. 48 sec. In the racing car category the honours of the day fell to Collomb, who, on a Rochet-Schneider, made the ascent in 24 min. 40 sec., a relatively slow performance in view of the fact that last year Cagno on a Fiat did it in 19 min. 13 sec. Rougier, who was driving a De Dietrich, took one of the corners too sharply, and was unable to finish owing to his steering gear being damaged. The meeting was brought to a close by a

### Motor-Car Construction in Spain.

There is at present only one motor-car factory in Spain, the Compania Hispano-Suiza, of Barcelona. Until last year the output was confined to 14-18-h.p. and 20-24-h.p. cars; this year, however, it began to build 40-h.p. vehicles, and has already turned out a number of them. The concern is making good progress financially, the secret of its success probably lying in the fact that it constructs its machines with an eye to their use on the bad roads of Spain.

### Miscellaneous Items.

A proposal of the Budget Commission to impose a tax of 10 fr. on motor-car drivers is exciting considerable opposition in Paris. —About fifty entries have been received for the Austrian Automobile Club's annual hill-climbing competition from Schottwein to Semmering, which is fixed for Sunday next. —It is reported that Messrs. Benz and Co., of Mannheim, have decided to build a six-cylinder racing car for the 1907 season. —The Automobile Club of Milan has decided to organise an international motor-car race for the 1907 season. —The name of the Daimler Motor Company, Ltd., of Coventry, appears in the list of exhibitors at the forthcoming Paris Salon.

## CORRESPONDENCE

(Letters to the Editor should be addressed to the offices,  
87-88, Charing Cross Road, W.C.)

### THE PROPOSED TAXATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If what we hear respecting the increased taxation of automobiles which the Government hold in prospect comes to pass it means discourtesy to and direct disregard of the recommendations of those gentlemen forming the Royal Commission, and in the event of such a taxation as that suggested (i.e., £1 per h.p.) being forced on the already suffering motorist, the most strenuous opposition should be made by everyone connected with or affected by the movement. It must be taken up all along the line in a systematic manner. There must be no half-heartedness or diversity of opinion, and we must look to institutions like the Automobile Club, the Automobile Association, and the Society of Motor Manufacturers and Traders to formulate the opposition programme.

It will not, of course, affect the moneyed man with the large car

### A DIFFICULTY IN STARTING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I would be glad of a hint to enable me to overcome occasional difficulty in starting my 6-h.p. Benz car. After running all right and starting quite well for some time on half-compression with starting handle, it suddenly refuses to start, so that it has to be put on full and started by turning wheel on full, which is rather hard work. Everything appears to be all right, valves, mixture, current, &c. Thanking you in anticipation.—Yours truly,

COUNTRY DOCTOR.

[The difficulty experienced by our correspondent is no doubt due to the sticking of the inlet valve, the suction on half-compression not being sufficiently strong to open the valve. A little petrol injected by the valve would greatly tend to remedy the trouble, and a small hole might be drilled in the valve cover for this purpose.]

### RESOURCEFULNESS—AND A SAND BAG.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Whilst the Swift Tourist Trophy car was having a road test the other day, one of the rear tyres suddenly burst. An inspection revealed the fact that there was a slit in the cover measuring exactly  $7\frac{1}{2}$  in. from end to end, and this many miles from any station. All that was on board was an inner tube and an ordinary Dunlop repair outfit,

Mr. A. E. Crowdy at the wheel of the Wolseley Car he will drive in the Tourist Trophy Contest. See page 617.

to the same extent as the man of moderate means—doctors and other professional men—and middle-class people, whose car indirectly means an assistance to existence; why should they be saddled with such proposed outrageous taxation? As an instance, take the usual run of purchasers of a car of about 10-h.p., I should say that 80 per cent. of these cars are sold to men who cannot be described as wealthy. It is because they are not wealthy that they purchase a vehicle of this description, inasmuch as their requirement is for a car which will convey them speedily from place to place and require no more skilled attention than they themselves can give. If it were necessary for the local practitioner to employ a skilled man to look after his machine, this fact would deter him in many cases from investing in anything more expensive than an ordinary bicycle or motor-cycle. It is on this class of owner that the imposition of such a tax would fall more heavily.

Another point of view which apparently has not received the attention it should do is that of the manufacturer. Here in England manufacturers are making superhuman efforts to recover the ground lost some years since, and forming an industry by which means thousands of families are supported each week, an industry which Britain must be proud of. Why let the powers that be nip that industry in the bud, why kill it in its infancy? It is a penny wise and pound foolish policy, and if ever such a taxation came into force would be worthy of the most strenuous condemnation. If increased taxation must be, restrict it to the £1,000 car owner, but let the local practitioner, the tradesman, and the middle-class man alone—I venture to think he cannot, and in the end will not, submit to such harsh measures.—Yours truly,

B. G. B.

and, as you will know, the cover patch included in this outfit measures  $6\frac{1}{2}$  in.—that is, the thick or “business” part. We nearly covered the hole by putting on the patch crosswise, but of course this would not hold. It looked as if the car would have to suffer the indignity of being hauled by a horse, when a brilliant idea struck the driver. Cutting off 14 in. of the top end of one of the ballast sand bags in the car, it was but a few moments’ work to lay this novel patch across the rent and to insert a new tube, and after a little trouble in coaxing in the cover (of course we had to have a piece of bag overlapping at each side of the cover), the tyre took the air without flinching and we drove the fourteen miles home at a speed which was as good as anything we had done prior to the mishap. On reaching home the driver, Mr. R. Every, wittily remarked, “Moral, always carry a sand bag.”—Yours truly,

ROBERT BURNS.

### GRINDING IN VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the correspondence in the *M.C.J.* of the 8th inst. re valve grinding, Mr. Huddleston advocates the use of a brace drill with a screw-driver fitted for this purpose. I beg to state that I consider this injurious. By continually turning a brace in the same direction, should there be any coarse particles in the emery powder, these form a continuous circular scoring around the valve and its seating. By the use of an ordinary long-handled screw-driver this danger is lessened, as the backward and forward motion limits the area of scoring; moreover, by this method a more evenly ground surface is obtained. What Mr. Huddleston styles as “medium” emery powder, I do not know; there

are so many grades. Myself, I invariably use knife powder for the first treatment until all the worst pit marks are ground away, then finish as this gentleman suggests, with powdered pumice. If the valve is so badly pitted that knife powder seems too fine a grade of emery, it is undoubtedly wiser to have the valve turned up in the lathe to get the worst out; this avoids unnecessary work in grinding, besides saving the valve seat. It is undoubtedly wise to also fill up the passage to the cylinder with a piece of waste or similar material whilst the operation of valve grinding is taking place.—Yours faithfully,

ALAN A. L. HICKMAN.

### DIRT IN PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I presume R. Foster, whose letter appears in the last issue of the *M.C.J.*, uses Shell spirit, by the red sediment. I had the same trouble and was advised to try the best quality Carburine, and then found blue sediment. I now have the petrol delivered at my house and put very fine muslin over the funnel as well as the ordinary gauze and no more dirt gets through.—Yours truly,

C. E. THORNE.

### THREE MEN ON A 'BUS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would it not prove profitable for the motor-'bus companies to re-adapt Jerome's phrase of "Three Men on a 'Bus," and to have a third party, a lad preferably, to look after the passengers?

The driver has to keep his attention on the road in front of him and the wheel before him. He cannot look about for passengers as do the drivers of the horse-drawn vehicles; he must concentrate his attention on his own work. The conductor is up and down the 'bus, inside and out, collecting fares and generally attending to those who have already boarded the vehicle; he, too, cannot always see the pedestrians anxious to become passengers. Thus the two men engaged on the vehicle have enough to do to drive the 'bus and attend to passengers, without paying much regard to the would-be riders.

I would, therefore, suggest to the companies that they should employ a lad on the 'bus to keep an eye for likely passengers, and to cry "Halt" when people wanted to mount. The expense would be little, and the extra wages would be more than covered in the increased traffic secured. At the same time the companies would always have a number of young fellows growing into experienced conductors. A kind of apprenticeship system might be established in connection with the work, tending to the convenience of the public and the profit of the company.

Knowing with what favour the *M.C.J.* is regarded by the promoters of motor services because of the information it gives on such matters, I trust the subject will be deemed worthy of discussion in your columns.—Yours truly,

B. A. COLLIER.

### BRIGHT PARTS ON CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Finch's letter in the last issue of the *M.C.J.* on the above subject is to the point. It has been asserted on good authority that many more people would buy cars could they but feel that they had the time to give the vehicles the attention they require. So far as the mechanism itself is concerned this does not apply directly, as the minor adjustments usually needed by a good motor-car are trivial consumers of time and anything serious in the way of repairs is handed over to those with adequate facilities. But the cleaning of a car occupies a good deal of time, and it is an item that is seldom considered in connection with the amount of attention that must be devoted to a machine by the motorist who cannot afford a chauffeur. A car never returns from a run clean, however short it may be, and the vast expanse of highly polished varnish with its brass or plated trimmings soon shows the effect of neglect in a manner that is unmistakable. To preserve even a semblance of its original brightness by the end of the season, immediate and painstaking care, not to mention facilities for washing not usually afforded by the average private garage, are imperative every time the car comes in from a run. Having this in mind, I fully endorse the opinion that the ornamentation of the car should be restricted as much as possible, not alone to prevent it becoming shabby in a short time, but also to save the great amount of time and labour that must otherwise be devoted to the process of cleaning and polishing. At the same time the finish should be such that they could be used under all weather conditions and still look well.—Yours truly,

R. J. BAKER.

### POLICE METHODS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Inspector Jarrett's recent abortive prosecution of a member of the Automobile Association calls for serious attention from all right-minded people. The inspector said that a gentleman named Berrington drove his car at a "murderous rate" along the Brighton road, but, in answer to his promptly issued summons for driving at a speed dangerous to the public, it was conclusively proved that the "murderous rate"

existed only in the inspector's far too vivid imagination, as a defect in the engine made it impossible to exceed the speed of seventeen to eighteen miles an hour. Further, on the day of the alleged offence Mr. Berrington was kindly inspecting one of the Automobile Association's lines of cyclist patrols who are placed on the roads to warn motorists driving at a dangerous speed, and to assist members if they have breakdowns. Inspector Jarrett denied that the amber-coloured official flag flying from the inspecting car attracted his attention, about which there is of course nothing further to be said; but his conduct in endeavouring to show that our men are primarily engaged in warning motorists as to the whereabouts of police traps was as reprehensible as it was uncalled-for and suggests that the yellow badge and not the "murderous rate" of speed was the real reason of the prosecution.—Yours truly,

STENSON COOKE.

### SIX WHEEL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The last Paris Salon was notable for the presence of three six-wheel motor-vehicles, one being shown by the De Dietrich Company, one by a M. Borderel, and the other a motor-lorry built by M. Janvier, of which latter you gave some illustrations in the *M.C.J.* a month or so ago. As far as I can ascertain, however, the six-wheel idea does not appear to be making any progress. Certainly one does not hear of them in this country, and it would be interesting to learn whether the

A 20-h.p. Scout Brougham recently completed by Messrs. Dean and Burden Bros., Ltd., to the order of Mr. E. Marsh, trainer for His Majesty the King.

same holds true in France. The idea is one which I consider is well worth developing, as the construction presents many advantages from a mechanical point of view. For instance, the weight is distributed on six points instead of on four, so that the strains on the tyres should be greatly reduced. The springs extend from one end of the frame to the other, and render the three axles absolutely independent, one with respect to the others, and free to follow the undulations of the road. The frame is, of course, slightly increased in length, but that is a matter of little importance, as the vehicle can turn in a very short radius.—Yours truly,

ENGINEER.

### DE DION CAR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter from Mr. John Boorer in the last issue of the *M.C.J.*, I had the same trouble with a 10-14-h.p. Renault, and found it was caused by the collar of the clutch lever pressing lightly against the bearing of the revolving flywheel. The noise stopped on pressing lightly on pedal. To remedy the trouble fit a spring to keep the collar from touching.—Yours truly,

G. B.

### TAIL LAMP TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For some time past I have been experiencing a most annoying series of tail lamp troubles, and should be greatly obliged for any hints as to a lamp that may be relied upon. It is not only discomforting to one's passengers to be continually worrying them with the question "Is the tail lamp in?" but extremely irksome to have to get down every

few hundred yards to relight the lamp, not to speak of the chance of being summoned, fined and one's licence endorsed. One motoring friend suggests the use of an ordinary cycle lamp, while still another suggests an acetylene one. As I feel sure this difficult question of tail lamps is not confined to myself, those motorists who have overcome it and are able to drive along at night with a free and easy mind will be doing a service to their fellows if they will give them, through your columns, the benefit of their experience.—Yours truly,

F. ELWOOD.

### THE SUPPLY OF SPARE PARTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My car has lately required several of its small parts renewed, and I have been astonished not so much at the delay which has ensued, but at the heavy charges made. It seems to be a foolish policy to make the prices of spare parts as high as they can be possibly made with the idea that they should be profit-bearing as well as the complete machines. In my opinion, prices of these parts should be made as low as possible; just high enough to cover the cost of production and handling. This would encourage owners to replace parts more promptly and would add greatly to the satisfactory service given by the car, and consequently enhance the reputation of the makers.—Yours truly,

PRESTONIAN.

### OVERHEATING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be much obliged if through the medium of your popular journal you could tell me what is the matter with my 12-h.p. Prunel

impression seems to be widely current that at some future time it may be put into usable form, despite the great obstacles standing in the way of its development. In a paper recently read before the Junior Institution of Engineers, Mr. Dugald Clerk presented most cogently the difficulties which seem to render extremely dubious the practical solution of the gas turbine problem along any of the lines which have yet been proposed. The method of gas turbine operation which is treated of as the only practical one is that of furnishing to the turbine blades gas issuing at constant pressure through a jet, from an exploding chamber in which the charge is compressed by external means, the gas operations being thus on the so-called Brayton cycle.

It is pointed out by Mr. Clerk that any attempt to serve the turbine blades with gas at the temperatures common in piston engines—1,600 deg. or 1,700 deg. C.—would cause their rapid destruction, as these temperatures are above that of the melting point of platinum, and above the softening points of many of the most refractory non-metallic materials. According to the figures given, about 500 deg. C. is as high a temperature as turbine blades made of any available material could permanently withstand. This fact necessitates a gas supply to the turbine at very greatly reduced temperature, and the expanding jet between the exploding chamber and the turbine must perform this function—converting the heat of the issuing gas into kinetic energy of motion of the fluid, which energy it is sought to realise at the turbine blades. It is regarded by the author quoted as very doubtful whether a jet capable of a sufficiently economical transformation of heat into gas velocity can be attained. It is also pointed out that, as the turbine principle is adopted in order to obviate the use of reciprocating parts, a piston compressor cannot be consistently employed to feed the compressed charge to the exploding chamber, and it is doubted whether a rotary or turbine form of compressor, of satisfactorily high efficiency,

The Tourist Trophy Race.—A View of the Loch Promenade, Douglas.

car. It has developed overheating, and after running a few miles the inlet valves commence snapping; in fact, one day both the inlets and one exhaust valve broke at one stroke, and the exhaust pipe gets red hot. I have tested the radiators and there seems to be a good water circulation, and I have put on new rubber connections, but all to no purpose. If any reader can help me out of the difficulty I shall feel indebted, as the car used to run all day without the slightest overheating.—Yours truly,

AUROL.

[We are inclined to think that the trouble experienced by "Aurol" is due to carbon deposit in the cylinder heads. This becomes incandescent after the engine has run a short time, and retains the heat, causing the water to boil. We would advise the dismantling of the cylinders and thoroughly clean the heads and pistons; at the same time make sure that the water jackets are free from fur. If this is done, no doubt the trouble will cease.]

### THE PROSPECTS OF THE PETROL TURBINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Ever since the steam turbine attained success as a competitor of the ordinary steam engine, the idea of utilizing the energy of exploding gas charges on the turbine principle has been widely entertained by those familiar with internal combustion engines. The gas turbine, as an ideal conception, has appealed to many, for the reason that it would, if realised, convert thermal energy directly into mechanical energy of rotation, without the intervention of reciprocating parts, and would be much simpler mechanically than gas or petrol engines of the cylinder and piston type—desiderata which might have an important bearing upon the future of the automobile art. Up to the present time no practical embodiment has been given to the gas turbine principle; but the

can be produced. The probable inefficiency of conversion of the energy of gas motion into blade rotation was also adverted to.

Even assuming the efficiencies of the compressor, jet and blades to be as high as could possibly be expected, and far higher than could at present be realised, and assuming the heat losses relatively no greater than those experienced in ordinary gas engines, it is shown that an indicated efficiency of but about 16.5 per cent. could be expected of a turbine of this type, while a piston engine of fair size would show an indicated efficiency about double this figure. The comparatively low temperature at which gas must be supplied to the blades, the inefficiency of the conversion in the nozzle, the losses in compression and very serious presumptive mechanical difficulties in the turbine, even at the temperature assumed, are regarded by Mr. Clerk as almost insuperable difficulties in the way of rendering the turbine practicable, although it is admitted that a certain lack of efficiency would be tolerated in view of the abolition of reciprocating motion. It is, however, judiciously stated in the paper that the rather discouraging conclusions drawn are based upon present knowledge regarding the subject, and that future discoveries and an improved line of attack may render possible a more favourable consideration of what is admittedly a most fascinating problem.—Yours truly,

R. H. HIGGINBOTTOM.

LOST.—On Sunday, September 9th, between Spring Hotel, Ewell, and Brixton, a connecting rod of a motor was lost. Anyone returning the same to Mr. F. Catling, 77, Fleet Street, E.C., will be rewarded.

GEAR BOXES.—"Salisbury" writes:—"Can any reader give me the name and address of the maker of gear-boxes with the letters S.A.G.E. cast on the case? The Brush cars have them, and they are of French make."

## CLUBS AND ASSOCIATIONS.

## LINCOLNSHIRE.

WOODHALL SPA was on Wednesday of last week crowded with cars belonging to members and friends of the Lincolnshire Automobile Club, who were holding a meeting at the Victoria Hotel in the Spa grounds. A meeting of the club committee had been held before the meet, at which several important matters were dealt with. The Dust Committee of the A.C.G.B.I. had sent their report and suggested that the Lincolnshire Automobile Club organise similar experiments to those held. While decidedly favouring the suggestion, the committee considered it was now too late this year, but will consider it when arranging next year's programme. Major Fowler's resignation from the committee was received, but he is to be asked to retain office the year out. Regulations were drawn up for the hill climb for the President's cup and for the speed trial for the Newsum cup, and they are to be published in the club handbook. Official timekeepers

Three prizes were given by the club, and were kindly presented by Mrs. Knight to the following winners, viz.:-

Name.	Car.	Weight of car and load in lbs.	Marks received for reliability.	Petrol consumed in ounces.	Resultant of formula.
1. Dr. Montagu Tench	12-16-h.p. Clement	2,780	3,000	225	370
2. Mr. W. S. Argent	18-h.p. Mercedes	2,898	3,000	280	310
3. Dr. F. P. Cayley	8-h.p. De Dion	1,728	3,000	170	305

The committee have decided to alter the hill climb on October 6th from an "open" to a "closed" event only, the hill selected being Bottledown Hill, situated between Little Bursted and Billericay.

A nasty accident occurred to Mr. F. C. Hill, one of the most energetic members of the committee, in returning from Witham on Saturday, when nearing Romford, owing to the lamp of a farm cart not being alight or being obscured. Mr. Hill's son was driving, and the cart being on Mr. Hill's near side he naturally assumed it to be going in the same direction as himself; the cart, however, was on its wrong side and going in the opposite direction, and upon the horse pulling over to its right side

The Essex Automobile Club's Reliability Run. Some of the Competitors at Witham.

are to be appointed for the club. A member who had lost a case against the driver of a car for careless driving was granted three guineas towards the expenses. It was decided to draw up a list of garages in the various towns for use by the members at a fixed charge. It was also agreed to draw up definite rules as to entry of members of the trade in club competitions and to hold another meet at Revesby in October, if the weather continues favourable.

## ESSEX.

THE Essex County Automobile Club held a combined reliability run and consumption trial on Saturday, starting from and returning to Witham. The cars were weighed complete with passengers on the weighbridge at the Tannery, kindly lent for the occasion, after which luncheon was served at the White Hart Hotel, Witham, to a large gathering of the members and their friends.

The cars, after having been filled up with petrol, were then dispatched over a circular course of nearly fifty miles, the route being through Kelvedon, Lexden, Braintree, Little Waltham, Hatfield, Peveril, back to Witham.

The handicap formula for determining the winner was the weight of car and load in pounds, multiplied by the number of marks received for reliability divided by the ounces of spirit consumed, the highest resultant being the winner. The maximum number of marks for reliability was 3,000.

a collision occurred, the shaft striking the car behind the front seats, resulting in the body of the car, a 24-h.p. Wolseley, being smashed up. Mr. Hill, sen., was thrown forward on the dashboard, and upon being carried into the Club House of the Romford Golf Club, was found to have broken a rib; the other occupants of the car escaped.

## KENT.

A MOST interesting meet took place on Saturday, when the members of the club had a picnic tea at Penshurst Park, by kind permission of Lord de Lisle. Afterwards an inspection was made of the mansion, one of the oldest in England, having been given to Sir William Sidney by Edward VI. Among some of those present were Mr. and Mrs. Waddington, Mr. and Mrs. Wyllie, Mr. W. Willis, Miss Willis, Col. Edward Latter, Mr. and Mrs. Brewerton, Mr. and Mrs. Fraser, Mr. and Mrs. Granville Kenyon, Mr. W. F. Young and Mr. E. St. Clair Duncan.

## MOTOR YACHT CLUB.

ON Tuesday last there was an impromptu club run to Bursledon, on the occasion of the Hamble River Regatta, which took place there that day.

Javelin has been safely hoisted into her winter quarters this week, and now lies snugly stowed on the deck of the Enchantress

alongside her formidable competitor Quicksilver. She was hoisted in with a motor winch mounted in the floating workshop belonging to the rear commodore.

The Cavancha, which took part in the Dartmouth Regatta, is engined with an Ailsa Craig motor.

### SCOTTISH.

THE Scottish Club have agreed to contribute towards the expenses of a member of the Club who has been sued by a carriage hirer for damage sustained by him through an accident, which took place on a county road, it being alleged that the horse attached to a wagonette shied at a motor-car which had been left unattended on the roadside at the entrance to a private house and with the engine stopped.

A series of driving examinations will be held at the principal centres in Scotland towards the end of October. Intending candidates should communicate as early as possible with the secretary of the Scottish Automobile Club, 59, St. Vincent Street, Glasgow, from whom the necessary forms may be obtained. Under the recent agreement with the Automobile Club of Great Britain and Ireland the examinations in Scotland will be conducted by the Scottish Automobile Club, upon whose recommendation the certificates will be issued by the Automobile Club of Great Britain and Ireland.

The Kettleby Hill-Climbing Competition. Dr. R. G. Hogarth's 12-16-h.p. Clement-Talbot Car going well.

### LEICESTERSHIRE.

UNDER the auspices of the Leicestershire Automobile Club, a hill-climbing competition, open to the members of the Leicestershire, Nottinghamshire, Derbyshire, Northamptonshire, Midland, Coventry, and Wolverhampton clubs, was held on Saturday, at Kettleby Hill, near Melton Mowbray. The course traversed by the competing cars is a thousand yards in length, with a rise of one in twenty-one at the bottom and one in four at the top. With the exception of a heavy shower towards the close of the competition, the weather was bright and fine, while the road was in excellent condition. A fair number of persons watched the contests, and although many of them could not boast of the luxury of a motor-car, they enjoyed the "sport" immensely, and were keenly interested in the proceedings.

The officials were as follows:—Judges, Mr. E. George Mawbey, M.Inst.C.E. and Colonel L. L. Powell, J.P.; clerks of the course, Mr. E. George Mawbey, Captain Byron, Messrs. R. Sutton Clifford, jun., A. H. Faulkner, and A. McAlpin; timekeeper, Mr. F. K. Ward, N.C.U., A.A.A.; starters, Captain Byron and Mr. R. Sutton Clifford, jun.; mathematician, Mr. W. Plant; clerk of the scales, Mr. A. Stagg; marshals, Messrs. A. H. Faulkner, H. R. Harding, F. W. Preston, G. Ineson, and J. G. McAlpin; secretary of the meeting, Mr. A. McAlpin.

The programme comprised three events. In the first one (A), open to cars with one and two cylinders, Mr. Victor Riley, of the Coventry and Notts Club, won the club medal for the fastest time. The club

medal for the best performance on the formula went to Mr. G. H. Waite, of the Leicestershire Club, with a 7-8-h.p. Clyde.

In Event B, a competition open to four-cylinder cars up to 20-h.p., the club medal for the fastest time was won by Mr. Philip Graham, of the Midland Club, who drove a 16-20-h.p. Rover car. The club medal for the best performance on the formula was secured by Mr. T. H. Woollen, also of the Midland Club, with a 12-16-h.p. Clement-Talbot car.

The club medal for fastest time in Event C, which was open to four-cylinder cars exceeding 20-h.p., was won by Mr. F. A. Bolton, of the Leicestershire, Notts., Derby, and Midland clubs, with a 35-h.p. Daimler, while the medal for the best performance on formula was secured by Mr. James A. Doran, of the Leicestershire Club, whose 22-h.p. Minerva, it is interesting to note, has already won six cups and two gold medals.

The silver cup presented by Captain Byron for the best performance on formula in all classes was awarded to Mr. G. H. Waite, who also secured the silver medal offered by Mr. Sutton Clifford for the best performance, on formula, in Classes A, B, and C, made by members of the Leicestershire Automobile Club. Special motor clocks for the best performance, on formula, in each event by cars using Pratt's motor spirit, were given to Mr. G. H. Waite, Mr. P. Graham, and Mr. J. A. Doran. The fastest time of the day was made by a Daimler.

The order of the competitors in each event was as follows:—

#### EVENT A.

Name.	Maker's Name and H.P.	Formula H.P.	Place in competition on F'ula.	Time.
R. Sutton Clifford, jun.	12-h.p. Richard-Brasier...	11-085	12	10
A. H. Faulkner...	10-12-h.p. Gladiator ...	12-887	11	8
T. Davies Pryce ...	8-h.p. Rover ...	7-594	9	4
J. B. Gerard ...	8-h.p. De Dion ...	5-614	3	13
Victor Riley ...	9-h.p. Riley Car ...	7-154	2	1
W. E. Price ...	6-h.p. De Dion ...	4-354	7	11
John M. Bennett ...	12-h.p. Darracq ...	11-23	10	5
Dr. W. R. Tuckett ...	7-h.p. Clyde ...	6-086	8	9
Dr. H. W. Boreham ...	10-h.p. Darracq ...	11-23	6	3
G. B. Fletcher ...	9-h.p. Mohawk ...	5-962	5	7
J. Toller Eady ...	8-h.p. Clyde ...	6-225	4	6
Dr. R. Hilton Fagge ...	8-10-h.p. Rover ...	7-594	13	12
G. H. Waite ...	7-8-h.p. Clyde ...	6-225	1	2

#### EVENT B.

J. A. Harper ...	10-12-h.p. Coventry			
	Humber ...	15-815	5	4
Walter Bentley...	16-20 h.p. Humber ...	20-686	8	7
T. H. Woollen ...	12-16-h.p. Clement-Talbot	16-222	1	2
Dr. R. G. Hogarth ...	12-16-h.p. Clement-Talbot	16-222	2	3
Otto Homberger ...	12-16-h.p. Clement-Talbot	16-222	4	8
Philip Graham ...	16-20-h.p. Rover ...	19-537	3	1
Sir Herbert Marshall ...	18-28-h.p. Mercedes ...	23-377	—	—
H. Belcher ...	16-20-h.p. Humber ...	23-377	6	5
W. W. Coltman ...	12-16-h.p. Fiat ...	21-505	—	—
J. A. Harper ...	16-20-h.p. Humber ...	23-377	7	6

#### EVENT C.

John Gaskin ...	30-40-h.p. Daimler ...	38-608	6	4
T. H. Woollen ...	20-24-h.p. Clement-Talbot	22-459	4	8
H. J. Marsden ...	20-32-h.p. Darracq ...	28-167	9	9
William Pilkington ...	20-24-h.p. Marchand ...	28-277	—	—
M. Ross Browne ...	22-h.p. Minerva ...	22-877	3	7
E. M. C. Instone ...	35-h.p. Daimler ...	45-077	8	2
James A. Doran ...	22-h.p. Minerva ...	22-877	1	6
Cecil Edge ...	40-h.p. Napier ...	32	2	5
Francis A. Bolton ...	35-h.p. Daimler ...	45-077	5	1
Albert Farnell ...	30-h.p. Daimler ...	38-593	5	3

At the close of the competitions, Mrs. Mawbey, wife of the president of the Leicester Club, presented the prizes, and on the proposition of Colonel L. L. Powell, J.P., was thanked for doing so. Mr. E. George Mawbey acknowledged the compliment on behalf of Mrs. Mawbey.

### AUTO-CYCLE.

AN excellent entry has been received for the annual race meeting of the Auto-Cycle Club, to be held at Canning Town to-day (Saturday), starting at 2 p.m. All the leading motor-cyclists will be competing, including C. R. Collier, H. A. Collier, J. Perkins, E. Varney, W. Hodgkinson, Harry Martin, W. W. Genn, and T. H. Tessier. The events are the championships of the motor-cycle racing world, and comprise one mile time trials, handicaps for tourist and racing machines, and a one hour scratch race for the challenge cup held by René Thomas.

### YORKSHIRE.

THE last gathering of the present season of the Yorkshire Automobile Club took place at Ripon on Saturday. The old world town extended a warm welcome to the folk who reached it by modern means, and for a couple of hours in the afternoon the market-place presented a busy scene. Cars came from all parts of the country. The distance from Middlesboro is a long one, but there were several cars from

that town, whilst all the West Riding centres contributed to the long list of visitors who partook of tea at the Unicorn Hotel. Mr. E. H. Hepper, the chairman of the Yorkshire Automobile Club, and Mr. C. P. Wilson, the hon. sec., welcomed the guests as they drove up to the hotel. They extended a courteous welcome to all, and especially thanked those who had come from a distance. Addressing the gathering at tea, Mr. Hepper referred to the application of the Ripon District Council to have danger boards erected. The erection of danger boards would, in his opinion, have a more beneficial effect than the so-called police traps. He believed that all motorists would respect danger boards, and he hoped that other district councils would follow the lead of Ripon. Amongst those present were the following:—

Mr. E. H. Hepper (Chairman of the Yorkshire Automobile Club), Leeds, on 18-24-h.p. Belsize.  
 Mr. J. E. Stead, Middlesboro, 10-12-h.p. Argyll.  
 Mr. C. Scoby-Smith (Chairman of the Cleveland Branch), Middlesboro, 10-12-h.p. Humber.  
 Mr. H. Hemmingway, Ilkley, 30-40-h.p. Daimler.  
 Mr. W. Tempest, Leeds, 12-16-h.p. Clement.  
 Mr. A. Exley, Leeds, 10-h.p. Minerva.  
 Mr. J. Constantine, Middlesboro, 16-20-h.p. Sunbeam.  
 Mr. T. M. Claughton, Guiseley, 10-h.p. White.  
 Mr. E. Faiers, Bradford, 18-h.p. Mercedes.  
 Mr. Guy Barrett, Horsforth, 8-h.p. De Dion.  
 Mr. J. W. Wasson, Bradford, 9-h.p. De Dion.  
 Mr. C. P. Wilson (Hon. Sec. Y.A.C.), Leeds, 12-14-h.p. Gladiator.  
 Mr. B. Walker, 10-12-h.p. Humber.  
 Mr. K. Chadwick, 10-h.p. Alldays.  
 Mr. H. J. Wells (Hon. Sec. Barnsley Branch), 10-12-h.p. Star.  
 Mr. C. Braithwaite, 8-h.p. De Dion.  
 Mr. and Mrs. W. Turton, Roundhay, 12-h.p. Gladiator.

The Committee of the Yorkshire Automobile Club has decided to postpone the hill-climbing competition fixed for October 6th, 1906, until next year, on account of the necessary permission not being forthcoming for the meeting on the hill selected, and also on account of the lateness of the season.

#### THE INTERNATIONAL BALLOON RACE.

SIXTEEN balloons will take part in the international long distance race for the Gordon Bennett trophy, which will start from the Place de la Concorde, Paris, on the 30th inst. The following is the order in which the competitors have been placed and the countries they represent:—

1. Alfred Vonwiller (Italy).
2. Hugo Von Abercron (Germany).
3. Comte Henri de la Vaulx (France).
4. Emilio Herrera (Spain).
5. Hon. C. S. Rolls (Great Britain).
6. A. Santos-Dumont (America).
7. Van den Driesche (Belgium).
8. Ing Scherle (Germany).
9. Comte de Castillon de Saint Victor (France).
10. E. G. de Salamanca (Spain).
11. Frank H. Butler (Great Britain).
12. Frank P. Lahm (America).
13. Baron von Newald (Germany).
14. M. Jacques Balsan (France).
15. M. Kindelan y Duani (France).
16. Prof. Huntingdon (Great Britain).

The arrangements for the race have been made by the Aéro Club of France. The start will be assisted by 200 French soldiers belonging to the Balloon Corps of the Engineers.

#### MOTOR CYCLING.

ON Saturday the Motor Cycling Club held a trial at Hockliffe, over a hundred mile course. The order of merit was as follows:—J. Van Hooydonk, Phoenix quad-car, 1; E. W. Goslett, N.S.U. tri-car, 2; W. H. Wells, Vindoc bicycle and trailer, 3. Those who made non-stop runs had to cover a seven miles course at a pace as near as possible to twenty miles an hour, the schedule time for the distance therefore being 21 min. Van Hooydonk did 20 min. 43 1-5 sec., Goslett 22 min. 3 2-5 sec., and Wells 23 min. 43 2-5 sec.

#### INQUIRY AT LLANDUDNO.

AN application by the Llandudno District Council for an order under the Motor Car Act to limit the speed of motor-cars to ten miles an hour within a portion of the town has been before Mr. Willis, Local Government Board Inspector. It was explained that the application was made more particularly in the interests of children and young persons who found it difficult to safeguard themselves in the crowded streets during the busy season, and it was suggested that the Council would be satisfied to have the order limited to six or eight weeks of the summer only. There had been very few convictions for furious driving. Mr. Rees Jeffreys opposed the application on behalf of the Motor Union of Great Britain and Ireland. The Inspector stated that he would report in due course.

#### PUBLIC MOTOR SERVICES.

BAILIE MACKAY is to table a motion at the meeting of the Perth Town Council to the effect that motor-buses be run in those districts to which the tramway service has not been extended.

THE Levenshulme District Council have decided immediately to cancel the licences they have issued to owners of motor-buses. This decision was made possible by the fact that in the agreement with the Manchester Motor Omnibus Company the council had protected themselves by the insertion of a clause which enabled them to withdraw the licence on complaint of nuisance being made. Similar action is being taken by the Wilmslow District Council, who have decided, by six votes to four, that motor-buses shall not be allowed to ply for hire in the district. The joint committee of the Urmston, Flixton, and Davy-hulme District Councils recommend their councils further to consider the application of the Manchester District Motor Omnibus Company for licences to ply for hire in those districts only on condition that the company pay to the local authorities a sum to be agreed upon for upkeep and repair of the roads. The stipulation is further made that only the best buses and tyres on the market shall be used, and that a maximum speed limit be fixed.

THE Corporation of the City of London has addressed a strong protest to the several motor-omnibus companies whose vehicles pass through the City against the prevalence of oil droppings, which are declared to be highly detrimental to the road pavements and a danger to the public. The asphalt paving companies, which have contracts for paving and repairing the carriage ways in the City, have also entered their protest, calling special attention to the damage done at the places at which the omnibuses stop.

Mrs. Cama on her 5-h.p. Baby Wolseley on which she took part in the Aga Khan trials from Poona to Satara and back, 145 miles, and won the Special Ladies' Trophy.

THE Truro Rural District Council is asking the Great Western Railway to establish a motor-car service between Veryan, Gerrans and St. Just.

THE Shoreditch Borough Council has obtained a grant of £25 a year from the Arrow Motor Bus Company as a contribution to the local rates, because the company has practically monopolised Boundary Avenue as a stopping place for its vehicles.

A MOTOR-BUS is now running in public service in the Burnley district.

THE Watch Committee of the Brighton Town Council have decided not to grant the application of Mr. Walter Tilley, of Park Crescent Place, Brighton, for licences for ten motor-cabs to ply for hire within the borough.

A MOTOR-BUS is now in daily service between Grimsby and Caistor. AFTER midnight no motor-bus going west may stop to set down or pick up passengers between Villiers Street and Trafalgar Square, London, and none going east between the square and the telegraph office east of Duncannon Street. At the same time, those going by way of King William Street must not stop between the Strand and the junction of Adelaide Street and Chandos Street at any time, so that some relief may be afforded in this bus-congested area. The past-midnight regulation is being enforced temporarily at present, but doubtless it will be permanently added to the list of those which the driver must obey.

#### NEW COMPANIES REGISTERED.

SEVENOAKS MOTOR-CAR AND ELECTRICAL COMPANY.—£8,000. No initial public issue. First directors, Messrs. H. Fulton (permanent chairman) and A. Whitehead. £100. Tubs Hill, Sevenoaks, Kent.

### MOTOR-CYCLE RECORDS.

H. MARTIN has just made an attack on F. W. Chase's six hours' motor-cycle record, at the Canning Town track, but, owing to rain falling heavily after he had been riding for four-and-a-half hours, he had to stop at five hours. He first got inside record at 101 miles, and beat all the intervening times. In three hours he rode 129 miles 464 yards, as against 115 miles 335 yards; in four hours he did 169 miles, as against 147 miles 1,370 yards; and in five hours he covered 199 miles, as against 189 miles 780 yards.

### MOTOR-CAR ACCIDENTS.

AN exciting motor-car accident has occurred near Peterween, East Fife. A car, which was travelling from St. Andrew's, capsized when rounding a sharp corner in the road, with the result that one of the occupants and the driver were seriously injured.

At the Marylebone Coroner's Court, on Saturday, Mr. Schroder held an inquest on the body of William Reason, a cabdriver, who died in Middlesex Hospital from injuries received through being knocked down by a motor-bus. The evidence showed that between 11.30 p.m. and midnight on Wednesday deceased was leading his cab from the cab-rank between Peter Robinson's and Jay's, in Regent Street, when a Pioneer bus came up Regent Street. Just as it was taking the corner into Oxford Street it knocked deceased over. The driver of the bus said that he was ten yards away from the hansom when the driver began to lead his horse. He sounded his hooter three or four times, and then slowed up. Answering questions he admitted he could stop within three feet by using the brake. The coroner asked why he did not stop at once seeing he was ten yards away. Witness said he expected the cabman to stop when he saw the motor approaching. The Coroner: The cabman would have expected you to stop. As there was no passenger in court to give evidence, the coroner said he would adjourn the case to see whether or not the hooter was really sounded.

WILLIAM HARGREAVES, of Brook Lane, Chester, when cycling down Backford Hill, about four miles from Chester on the Birkenhead road, on Saturday night, was run into by a motor-car. He was thrown through the glass wind-shield on the front of the car and one of his legs was broken. He was driven in the car to Chester Infirmary.

### CASES AGAINST MOTORISTS.

MR. JOHN S. D. BERRINGTON, of Messrs. J. D. Berrington and Co., of 21-23, Short's Gardens, Long Acre, W.C., was summoned recently for driving a motor-car to the danger of the public on the Sidlow road on the 19th ult. Inspector P. Jarrett said he heard the car racing along when it was about two miles from him, and when it came into sight it was travelling along at a murderous speed, and certainly going at least thirty-five miles per hour. Mr. Berrington stated that he did not exceed the speed limit. He suggested that the chief cause of the prosecution was the fact that on the occasion in question he was carrying the yellow flag of the Automobile Association. He pointed out that one of the cylinders of the car stopped working at Reigate, and as the road was uphill, it would be quite impossible to travel at the speed alleged. In the end the case was dismissed, the justices (we learn since the case was previously reported) being divided in their views.

AT Lewes, on Tuesday, Joseph Snuggs, of Brighton, was fined £25 and costs for driving a motor-car at excessive speed on the road from Brighton to Rottingdean. Since May, 1905, he is reported to have paid nearly £50 in fines.

ON Tuesday, at Bow Street, a chauffeur was summoned for driving a motor-car in Birdcage Walk, St. James's Park, at a pace exceeding ten miles an hour, contrary to the regulations. One of the park-keepers said the defendant was proceeding at the rate of eighteen miles an hour, but when he was stopped he said he thought he was "crawling along." The defendant was fined 40s. and 2s. costs.

RICHARD HILL, a chauffeur, of New North Road, London, was summoned at Kingston for exceeding the ten miles an hour motor-car speed limit in Richmond Park. Park-keeper Ballam spoke to timing Hill with a stop-watch over a measured quarter of a mile, the speed being at the rate of 19 miles and 406 yards an hour. Park-sergeant Gattrel, who signalled for the car to be timed, said that in his opinion the car was travelling at the rate of about 20 miles an hour. Hill stated that in the car at the time were Mrs. Franks, his employer; her sister, who was an invalid; and her son. He had strict orders not to drive fast on account of the state of health of his employer's sister. At no time on going through the park did the pace of the car exceed ten miles an hour, witness driving by the speedometer the whole time. The speedometer had been tested by the makers and found to be absolutely correct. The indicator was handed up to the Bench, and park-keeper Ballam said that on the car being stopped the hand of the indicator would fly back to zero. The indicator was not a register, and there was only the uncorroborated testimony of Hill that it had not registered more than ten miles an hour in the park. The magistrates stated that after most careful consideration they saw no reason to doubt the accuracy of the stop-watch. A fine of £3 and costs was imposed.

HENRY IND, captain of the Wigan Motor Club, was summoned at Wigan for allowing a certain identification number to be used by another person. The defendant explained that when he sold the motor he informed the purchaser he must communicate with the county

authorities at Preston and have the licence transferred. The defendant was fined 2s. 6d. and costs in each of two cases.

AT Bow Street Police-court, on Monday, Lord de Clifford, of Mount Street, Park Lane, was fined 40s. and 2s. costs for driving a motor-car over a measured furlong in the Mall at the rate of twenty-one miles an hour. His lordship was represented by a solicitor, who explained that his client was accustomed to driving near his own estate in Ireland, where the speed limit was very different from what it was in St. James's Park.

MAITLAND SCOTT, a chauffeur, of Queen's Gate Mews, South Kensington, was summoned at Bow Street Police Court on Monday for exceeding the speed limit in St. James's Park, and also for failing to produce his licence. Defendant said the car was a new one, and he was looking at the speed indicator all the time, but on testing it afterwards he found that it was no good—it stuck. There were previous convictions, and the defendant was ordered to pay fines and costs totalling £4 4s.

AT Newmarket Petty Sessions, on Tuesday, Mr. Lihenfeld was summoned for driving his motor-car to the danger of the public. Mr. Huntly Jenkins appeared for the defendant and the case was dismissed.

MR. ALFRED CATCHPOLE, the Secretary to the Motor House, Euston Road, was summoned at the Marylebone Police Court on Tuesday for unlawfully allowing an unregistered motor-car to stand in the Euston Road so as to cause an unnecessary obstruction. Mr. Staplee Firth defended, and after a very lengthy hearing before Mr. Paul Taylor the case was dismissed.

ON Tuesday four motorists were fined at Norman's Cross for driving to the public danger.

### ROAD REPORTS.

POLHILL.—The tar painting on the main London road at the foot of Polhill, near Sevenoaks, and to which the Automobile Club, after a visit to the spot by the Hon. Arthur Stanley, M.P., contributed a quarter of the cost, has proved a great success.

AN ESSEX IMPROVEMENT.—A member of the Roads Improvement Association who was travelling on the road between Cambridge and Colchester lost his way owing to the fact that a forked sign-post was marked only "Birdbrook" and "Baythorne," places which are unknown to the majority of motorists. He wrote to the Association, which drew the attention of the county surveyor to the matter, who has now given instructions for "Colchester" and "Halstead" to be added, thus making the directions perfectly clear.

AN EXPERT'S VIEW.—In his presidential address to the congress of the Incorporated Sanitary Association of Scotland, at Leith, on Thursday last week, Mr. Bryce, surveyor of Partick, dealt with the dust nuisance on public roads. He said the experiments of surveyors and engineers in France, England and Scotland have clearly proved that, while a large abatement of the nuisance can be accomplished by coating or sprinkling the roads with solutions, and painting with oil or tar, the almost unanimous advice of experts is to lay down roads of materials which will provide a waterproof surface, and be non-productive of the objectionable dust.

BRECONSHIRE.—Starting from the Bear Hotel at Crickhowell, there is a fine stretch of road for half a mile towards Brecon. It has been laid under the supervision of Mr. Sidney Howard, the surveyor for the County Council. Not only does a large amount of the ordinary traffic of the Crickhowell district pass over this road daily, but every day it carries the heavy motor-bus service which the Great Western Railway Company is running between Abergavenny and Brecon. Yet, although in its most frequented part the prevailing south-west winds are continually blowing fine white dust from the converging limestone roads upon it, the people of Crickhowell are loud in its praises as a road which, under motor-car traffic, is practically dustless. This piece has been laid for six months, has never been watered, and has never been brushed. Yet its surface is hard, regular, and unbroken, while a little further on, where the road was laid at the same time with hard igneous stone, but without Mr. Howard's new treatment, signs of wear are easily visible. It occurred to him that the use of a special artificial binding would both lengthen the life of a road considerably and diminish the dust nuisance. This seemed to be so, especially as the tendency of motor traffic is to remove the binding material and so gradually loosen the metal surface. In the process adopted the binding after a very little wear sinks to a small degree below the surface of the metallising, and so supports the metallising in a position that gives it its full wearing value. Thus the wear of the road falls entirely upon the hard igneous stone.

### POLICE TRAPS.

THE measured quarter of a mile is again a feature of the landscape in Richmond Park.

BETWEEN Condorrat and Cumbernauld, on the Glasgow-Stirling road, is a measured stretch of hill five miles long.

IN the Queen's Road, Hersham, is a police trap under the active supervision of Superintendent Marks.

IN consequence of complaints having been made to the police of the speed of cars on some roads in the East Riding of Yorkshire, the roads from York to Selby, York to Market Weighton, Selby to Market Weighton, Malton to Scarborough, and Hull to Bridlington, are being especially watched by the police.

## COMMENTS.

### Photographs Wanted.

SATURDAY the 29th inst. is the last day for receiving photographs in connection with the competition announced on page 634. Particulars of what is desired are given on that page; here we would suggest to motorists who are photographers—though the competition is not restricted—that any of the pictures they have taken during the season now waning will be eligible, and that we hope to secure a comprehensive selection fully reminiscent of one of the most successful summers since motoring began.

### The Blackpool A.ect.

WITH regard to the forthcoming motor meet at Blackpool, the General Purposes Committee of the Blackpool Corporation have sanctioned the proposal of the Blackpool and Flyde Motor Club to hold the motor races on the Promenade, and not on the carriage drive as at first suggested. The A.C.G.B.I. is identifying itself with the gathering, Colonel Holden, Mr. W. W. Ashley, M.P., and Mr. A. F. Bird having consented to act as clerks of the course. Entries will be received by the hon. secretaries, Messrs. A. H. Walker and J. Potter, up to the 6th prox., and we notice that a special marshal is to be appointed to examine all bodies fitted on touring cars to decide whether such can be "honestly described as a genuine touring body"—a recognition of some entries in recent competitions not without significance. The programme of the two days—Oct. 12th and 13th—meet comprises thirty items, and includes events for almost every type of automobile from the motor-cycle to the motor-bus. The latter race—over a kilometre course with a flying start—presents a distinct novelty, as the vehicles will have to carry 22 passengers comfortably. The motor-bus as a racer is familiar enough in the London Strand, but this will be the first time it has made its appearance on an authorised racing track.

### Motor-'Bus Traffic in London.

SEEING that medical men are such devoted patrons of the motor-car, which materially assists them in their visitation of patients, it is a pity that an outcry against various forms of automobilism should have come from hospitals, town and country alike. In the rural districts, where open air treatment is encouraged, the dust nuisance has become a menace in many places, and we cordially support the proposed tarring of such portions of road as were mentioned by Mr. Wilson Noble in his recent plea for considerate driving when approaching the children's hospital near Guildford. Now comes a complaint from the Charing Cross Hospital with reference to the motor-buses that hurtle past its walls almost every minute of the day. King William Street has become a popular route for motor-buses, and, although the police have prohibited them from stopping therein, there is no present authority which can divert them from the route altogether. To do that would entail the passing of a new Act of Parliament; but we fancy the proposal of the Police Commissioner to licence motor-buses for certain specified routes is an attempt to deal with special cases like that

of the Charing Cross Hospital. Provided that is its object, public opinion will be in favour of such official "getting round" the present law.

### A Case of Garage Law.

AN interesting decision to motor-car owners was given by Judge Moss at Llangollen County Court on Monday. Mr. Sydney Freme drove his car from Corwen to Llangollen Garage to have the brake-spring repaired. After the necessary work was done the garage manager took the car out to test it. When Mr. Freme called for it the gearing was destroyed, and he now claimed £20 damage, holding that defendants had no right to test the car in the absence of the owner. His honour Judge Moss held that the manager of the garage had a right to test the car, as had also a watchmaker when repairing a watch. Further, if in testing it part of the machinery gave way, and it was shown to be of defective quality, he (the learned judge) should hesitate to say the repairer was liable. He entered a verdict for defendants, with costs.

### Motor Traction and Railways.

AT the dinner of the Motor Union at Scarborough a railway director was in the chair and the manager of the traffic department of the North Eastern Railway Company, who is also chairman of the North Yorkshire Automobile Club, was among the speakers. So far as the first-class traffic on railways is concerned, railway officials do not love the motor-car, but the North Eastern Railway was one of the first to recognise the changed conditions of locomotion, and that company have done as much, if not more, than any other railway in introducing motor services as part of their undertaking. They have had a very successful season in connection with their motor-buses and have come to the conclusion that the motor-bus is a very valuable adjunct to the business of a railway company. Something has also been done in connection with the introduction of heavy vehicles for transporting merchandise, and Mr. Watson believes, although they have not yet had a sufficiently long experience of that form of traction, that it will prove a useful adjunct to a railway company's resources for the transportation of merchandise throughout Great Britain.

### The Care of the Highway.

UPON whom does the duty of securing the safety of the road depend? A case which has been heard in the Stirling Sheriff's Court suggests the question; although identical circumstances elsewhere give general interest to the subject. Near Lennoxtown there is a sharp turn in the road, and a high bank and hedges, the presence of which prevents persons coming in opposite directions from seeing their advance. When the case was taken before the Court the advocate for the defence argued that, as the County Council had failed to erect danger signposts at that point, his client could not be blamed for being ignorant of the fact that this was a dangerous point. There is no need to approach the matter in a narrow spirit; the prevention of accidents should be regarded as part of the work

of local bodies, and anything calculated to ensure the safety of the general public should be adopted without demur. Just as the authorities are responsible for the condition of the road surface, so they should be looked upon as the trimmers of hedges and the rounders of corners. But often they neglect their duties, and meanwhile the work will have to be undertaken by voluntary associations. That this neglect is fairly general is known to all. It was a case in North Britain which suggested our Comment, which may be ended by reference to another in the south of England. As Major Cecil Birt, stationed at Chatham, was cycling from Nettlebed last week, his machine was upset by some loose material at the side of the road about a mile from the village, and he was thrown over the handle-bar on to the bank. He sustained a severe internal injury, and died after an operation in the Royal Berks Hospital at Reading. At the inquest a verdict of "Accidental death" was returned, the jury adding that the attention of the authorities should be drawn to the dangerous nature of the road. This is certainly a matter that does not concern motorists alone; it is of importance to all who journey on the highway.

Mr. H. G. Watney, of Weymouth, at the wheel of his 26-30-h.p. 'Argyll. This is Mr. Watney's first car, which Mr. Clifford Earp taught him to drive in three hours.

### Taxation.

At length one of the organisations associated with Motorism has promised the provision of an opportunity for public discussion of the proposed taxation of motor-cars, and early in October the Society of Motor Traders will consider the proposals of the Royal Commission. These, it must be remembered, are the only serious suggestions before the public, despite the appearance of official origin with which other schemes have been heralded to an astonished public. In looking at the Royal Commission's proposals regard must be paid to the necessity for a just classification, so that intending motorists will not be frightened into an abandonment of their intentions with regard to the ownership of cars. Expenses of upkeep not being uniform, tyre repairs still a matter of uncertainty, and the fees, licences, and other charges many and unavoidable, there is a real need for some organisation to give a strong lead on this matter of taxation, so that the Local Government Board may be able to introduce proposals sufficiently reasonable to be adopted with a minimum of opposition.

### £1 per horse-power.

WHOEVER started the joke as to the intention of the Government to tax motor-cars at the rate of £1 per horse-power deserves credit for the air of verity with which the printed notification was couched. It is difficult enough in these times to ascertain the horse-powers of cars; but what would happen if vehicles were taxed step by step in proportion to their power only an imaginative person can comprehend. Cars of 60-h.p. have been known as of little more than half that power; an 18-h.p. vehicle has even been said to be capable of developing 150-h.p. We can fancy that if a tax of £1 per horse-power were imposed, scarcely a car of more than 5 or 6 h.p. would be seen upon the road, and that no Tourist Trophy car would be designated at more than one-fourth its present power.

### A Famous Scottish Hill.

A HILL-CLIMBING performance test on the ascent through Glencroe to Rest and be Thankful will be held to-day (Saturday), under the auspices of the Scottish Automobile Club. The start will be made at the bridge fully a mile from the summit, and the test will be over about one mile. The road is almost straight, and the test will be stopped before reaching the sharp turns near the summit. This particular road has become so familiar to motorists, owing to its inclusion in the course of the Scottish Reliability Trials, that the details of its gradient will be of general interest. The average incline over the proposed distance is about 1 in 15, and the gradients are approximately as follow:—

580 ft.	...	...	level	650 ft.	...	...	1 in 12
615 ft.	...	...	1 in 62	340 ft.	...	...	1 in 9
740 ft.	...	...	1 in 43	430 ft.	...	...	1 in 8
600 ft.	...	...	1 in 18	515 ft.	...	...	1 in 7
310 ft.	...	...	1 in 10				
500 ft.	...	...	1 in 13	5,280 ft.			

The event is solely a sporting one, and cars (which must be registered as, and be, the *bona-fide* property of the entrant) may be entered by members of the Scottish Automobile Club only, and must be driven by a member of the Club or by a member of the family of the owner.

### The Motor-Cycle as a Means of Sport.

CONTINENTAL visitors who may have been present at the Canning Town track on Saturday would find some justification for the old tradition about Englishmen taking their pleasures sadly. The race meeting was well organised, and Mr. F. Straight's enthusiasm left no detail to chance. But despite all that the crowd never became cheerful, and not until one of the machines caught fire and was dragged along the track with flames rising high into the air did they show much animation. The motor-cycle is an effective vehicle enabling many commercial travellers to get over their ground with speed and ease; it is a capital pleasuring form of motorism; but whether it lends itself to a permanent place as a "sport" is a matter of dubiety. In the old days of the motor-tricycle, when there were always chances of fun to the onlooker, track riding was sometimes enjoyable; the certainty and reliability now attained have destroyed its attraction from the spectacular point of view.

### Incitement.

SOME time ago the Corporation of Dover sought powers from the Local Government Board to reduce the speed limit on motor-cars passing the town. The request was, after expert inquiry, refused, and no one has been a limb the worse. In fact, the immunity of Dover from automobile mishaps is recognised by the local journalists who have been trying to incite the Town Council to what seems to verge upon illegality. They are advising that notices should be posted on the roads entering the borough to the effect that the police will prosecute all drivers of automobiles proceeding at a speed exceeding eight

miles an hour. All such drivers should, in the opinion of these self-appointed dictators, be charged with furious driving. Here is another instance of the way in which some public persons over-reach themselves. With the provision of warning notices all will agree, and we hope the Council will recognise its duty in that respect so far as its narrow streets and sharp turns are concerned; but to institute a speed limit after the Local Government Board has declared such to be unnecessary is distinctly beyond the powers of Corporations, even those of towns like Dover.

**Central rather than Local Authority.**

EMPHASIS may be given to this attitude of the Dover people, because it is fairly typical of what would happen were the local authorities to have the power of regulation that is now vested in the central authority at Whitehall. Yet such is the idea which, vented by Mr. F. J. Moulton before he became a judge, has been favoured by a minority of motorists

growler. Away in Kennington a garage is being erected for a new service of motor-cabs for the Metropolis, and already men are being trained to take their places at the wheel. The taximeter will be duly fitted to these conveyances, and with the New Year London should "make the pace," so far as its street traffic is concerned.

**A Typical Surrey Trap.**

WHILE the Mayor of Scarborough was, on Saturday, welcoming motorists to a town "where they were recognised and appreciated and not trapped or ambushed," the police "trap" in Chilworth New Road, at Shalford, was being graphically described in the police-court at Guildford. It transpired in the cross-examination of Inspector Jennings and other police witnesses that the inspector and a constable sat in the comparative privacy of the former officer's front garden. They were provided with newspapers so as not to attract the attention of passing motorists, but really, through a gate which stood

The Tourist Trophy Race.—Mr. Sopwith's Peugeot Car at the Devil's Elbow.

and endorsed by a larger number of the public. If carried into law it will prove a harassing and troublesome regulation, for there is no doubt of the fickleness of public opinion, especially when accidents occur in a locality; and motorists would never be safe from the vagaries and antipathies of some local councils wishing to thwart their progress. The continuance of power with regard to the regulation of the speed of cars in the hands of the central body must be regarded as an essential feature of any future legislation.

**The Motor Cab.**

LIKE the 'busman who has driven all his life behind horses, the London cabby is doomed, and his visage is being soured by the changes that are coming over his occupation. The introduction of the taximeter is a threatening menace to his calling, and promises to stop the occasion for much of his choicest language by providing a tell-tale from which he will appeal in vain. And now on several West-End ranks the mechanical cab has taken its place, and the neat uniformed driver looks askance at the fading stars of the hansom and the

ajar, they watched for signals from another policeman secreted behind a telegraph pole and some shrubs. The signal given, the stop-watch was set going, and the motor-car having passed the inspector's house, a police whistle warned yet another constable to stop the car. Being Sunday afternoon when these proceedings took place, the people gathered in their gardens to watch the fun. What surprised the seven motorists who were summoned was that, in spite of the stop-watch, they were summoned for driving to the common danger, and not for exceeding the limit, it being asserted in every case someone was endangered by the speed of the car. Fines of £3 to £5 were inflicted, and not a driver escaped.

**Unnecessary Societies.**

THE discussion in the "Daily Telegraph" on the motoring problem has elicited a few useful letters and produced quite a large crop of persons willing to form associations to improve motorists off the face of the earth. Others are anxious to form organisations of motorists to teach manners to the fraternity and to suggest a slackening of speed generally.

Practical persons are not likely to be beguiled into membership of any of these unnecessary societies, for the existence of which there is no real need. By loyal support of those already in being more good is likely to be done than by sympathy with the suggested associations.

### Sound the Horn.

QUITE a dozen cases have lately been heard in the police courts about London in which complaints have been made of motorists not sounding the horn, nor giving audible notice of their approach. The difficulty of correctly apportioning blame in such situations is aggravated by the different points of view by which the matter can be approached. The man on the car looking ahead has his own notions with regard to announcing his approach; the man on the pavement would probably like a whole chorus of notice from vehicles likely to impede his progress across the road. Therefore all that can be urged is that motorists should ever be on the alert ready for any emergency. However comfortable the car may be, and easily controllable its pace, the driver must never be lulled into neglect of the legal requirements, nor those preliminary assurances of safety to the public suggested by his own common sense.

Messrs. M. and Walter Davies, the Patentees of the Stepney Spare Wheel, on their 18-20-h.p. Beeston-Humber Car.

The vehicle, which is run entirely on four Stepney wheels for demonstration purposes, was recently driven from Beeston to Llanelli, via Coventry, Birmingham, Cheltenham, Hereford and Llandrindod Wells, without any adjustments. The nickel ring at the side of the driver is a permanent fixture for carrying the spare wheel when not in use.

### Beware of Kingston.

A PERIOD of harsh and vindictive fines is about to be established by the Kingston Bench, and no leniency is to be shown in the administration of justice at the Court there; at least, so far as motorists are concerned. The chairman has announced that in consequence of the numerous summonses against motorists which the Bench have to deal with it was necessary that the punishments should be made more severe. Therefore, he gave notice that drivers of motor-cars who were brought before the Court for infringing the provisions of the Act would in future be more heavily fined than hitherto. Whether this announcement will have the effect of diminishing the nuisance which exists on the Kingston-Ripley road, particularly on Sundays, remains to be seen, but dwellers in houses bordering on that fine highway will watch the experiment with keen interest, while a certain section of the ratepayers are already expressing delight.

## M.C.J. PRIZE COMPETITIONS.

### MOTORING EXPERIENCES.

FROM the large number of Motoring Experiences received in competition, the prize of one guinea has been awarded to Mr. John D. Saunders, Inglewood House, Inglewood Road, West Hampstead, for the following:—

"Both accumulators running down on a Saturday night recently, my car was 'hung up' outside an elderly cottager's garden in the West country. 'Ow long be you going to be ere?' questioned the cottager. 'Can't say, perhaps all night,' I replied. 'What? not if I can help it, sur,' and he toddled in and fetched out a box of tools (?) 'There, I'll lend 'e a 'and. I'm a very pious man meself, and 'tho' I 'ates the stinkin' things, it shan't be my fault if you drives un on the Lord's day.'"

The winners of the two prizes of half a guinea are Mr. S. Russell, Gledholt Road, Huddersfield, for the following:—

"In the early days of motoring I started for a run to London on a Benz dog cart, a gentleman friend in front with me, and my wife behind. Passing through Doncaster, where they were laying tram lines, we had to make a detour, and after ascertaining the way we could get through, we must have started rather suddenly, as we heard a shout, 'Hey, meester, you've dropped your lady!' The lady was evidently not much hurt, as before we could stop she was running after the car for fear of being left behind."

And Mr. C. H. Weston, Old Road Lodge, Basset, Southampton, for the following:—

"Touring in France last year we stopped an hour at Dreux, sight-seeing, leaving the car unattended in the street. On our return it refused to start, and after many attempts I went in search of a *mécanicien*, who was also unsuccessful. Then all hands pushed the car down the street and round a corner (under a blazing sun) to the garage, where preparations were made for thoroughly exposing the wiring. An idea struck me and the *mécanicien* at the same time, possibly the pin for closing the circuit was not there. Where was it? In my pocket."

### AUTOMOBILE PHOTOGRAPHS.

Three prizes are being offered—one of a guinea and two of half a guinea—for the best photograph in which a motor-car figures. In making the award regard will be paid to the public interest of the picture, as well as to its artistic merits; hence, photographs of cars outside historic buildings or monuments will be as welcome as those of vehicles in pleasant places.

Only original photographs may be submitted, the copyright of which belongs to the competitor. The winning photographs will be published in the *M.C.J.*, and the Editor reserves the right to reproduce, without payment, a selection of those not successful in the competition. The latest date for receiving photographs is Saturday the 29th inst. Envelopes must be marked "Competition," in the top left-hand corner.

ENTRIES for the Town Motor Carriage competition of the A.C.G.B.I. close on Monday next.

THE Commercial Vehicle trials of the A.C.G.B.I. are announced to take place before March of next year.

NEGOTIATIONS for a combination between the Argyll Motors, Ltd., and Messrs. Scott, Stirling and Co., Twickenham, have just been concluded. The new company is to be known as Argylls and Stirling Commercial Motors, Ltd. Twenty motor-buses a week will be produced at the new works at Alexandria, which, covering three acres, will form part of the vast establishment on the banks of Loch Lomond, where Argyll cars are made. Argylls, Ltd., of course, will continue the business of producing lighter vehicles, for which they have exceptional facilities. With the Stirling buses a valuable combination of interests is provided which should do much to improve a great and growing British industry.

## THE TOURIST TROPHY RACE.

DOUGLAS, Tuesday.

**A** GAIN the din of battle is in the air and the great struggle of motor-cars has awakened the Isle of Man to the possibilities of speed. For weeks past the natives have marvelled at the tales that have been told—some even more marvellous than those of previous years—and have become subdued in manner whenever news of fresh disasters have occurred. The practice hours have been prolific in accidents. The freedom from mishaps which has characterised the trials run in the past has been contrasted with the rehearsals of the present year, and the people have wondered that they should have been so serious this time.

Luckily the Manxmen have become familiar with speedy cars since the Gordon Bennett eliminating trials were held there in 1903, but unfortunately the visitors have not acquired the skill of avoiding accident. The James and Browne car collided with a flock of sheep the other day, killing two of the animals and suffering such damage that it was not expected to be ready in time for the weighing-in to-day. To these non-starters must be added the Speedwell car, which was to have been the first of the British-built vehicles of that make, but which could not be completed in time, a similar reason being also assigned for the absence of the two Straker-Squire cars.

Ballacraigne. Sixteen miles is the distance of this cut out of the old course of fifty-two miles. The new stretch of course is along the main road to Peel, then out by St. Germain's, or Poor Town to Kirkmichael, when the old course is run into, and completed through Ballaugh, *via* Sulby (instead of by Jurhy, as last year), to Ramsey, and thence by the mountain road, skirting Snaefell Mountain, at a height of 1,400 feet, and then descending, except for a single 200 yards rise, into Douglas—altogether 40½ miles.

There is a great crowd of motorists about Douglas, and, in addition to the drivers, mention may be made of Earl Russell, Col. Holden, Major T. H. Cochrane, Capt. F. E. Dyke Acland, Messrs. R. Todd, Worby Beaumont, J. Lyons Sampson, Wilson Noble, Alec. Govan, E. H. Watson and T. C. Moore-Brabazon.

Yesterday the hopes of the supporters of the Deasy car were upset by the sad accident which happened at Hillberry Corner, which reduced No. 30 to immobility. Hillberry Corner is two miles from Douglas. A number of cars had left headquarters at daybreak to make the circuit of the forty mile course from Douglas, by Peel, Kirkmichael, and the Ramsey Mountain road back to Douglas. Several had preceded the Deasy car round the Hillberry Corner. Mr. J. W. Crouch drove there at a quarter past seven, and, taking it too wide, failed to clear the gutter. The rear axle struck and shattered some stone steps at the roadside, and the mechanic, Hinds, was thrown over the car's bonnet and fell on his head. The car itself collapsed in the

The S.C.A.R. Car at Quarter Bridge, near Douglas.

Some disappointment has been expressed at the non-appearance of a Florentia car which had been entered by its owner, Lieut. L. Gordon. He was here with the car a few days ago, but upon seeing some of the vehicles then practising, with their wire wheels and rakish-looking bodies, he came to the conclusion that it would not be fair to run a car actually built for touring purposes against vehicles allied to the freak variety. Captain W. E. D. Owen has scratched the two Ariel cars he had entered, and the Brown car will also be an absentee. The 22-h.p. Brown car has been withdrawn for much the same reason as the Florentia, and Mr. Albert Brown makes the suggestion that in next year's race only genuine touring cars as listed and as sold in that same year by the manufacturers should be allowed to compete. The Pipe and Armadale cars are non-starters.

The race will have a new interest from the altered course. The portion of last year's route through Castletown, and by Foxdale, to Ballacraigne, has been left out, because it stopped railway traffic on both the Port Erin and Peel lines. This change takes away three of the four real hill tests on the old course. First the Pulrose rise, commencing about a quarter of a mile from the start. Then the Richmond, a half-mile hill three miles out, with portions of a gradient of one in ten. And next the three-mile straight rise from Silverburn (two miles beyond Castletown) to "Snuff-the-wind," the crown of the high-road, from which the course descended through Foxdale to

ditch forty yards from the steps. The driver and Mrs. E. W. Lewis, who was a passenger, kept their seats, and were practically unhurt.

There have been serious complaints with regard to the way in which some competitors have been practicing when there was a fair amount of traffic on the road, and many of the local officials expressed strong views on the matter. In fact, His Excellency the Lieutenant-Governor, Lord Raglan, a few days ago gave notice to Mr. J. W. Orde, secretary of the Automobile Club, that the question of holding the race must be in abeyance, as he was determined that the authorities should not be flouted in the way they had been. An interview was then arranged, and His Excellency signified his willingness to allow the race to be held, on receiving an assurance from Mr. Orde that a strong letter of protest should be sent to all competitors, and warning them that if any of them repeated the offence, they would be disqualified from participating in the event.

Tuesday, Midnight.

To-day's proceedings in connection with the Tourist Trophy event have been of considerable moment, and the number of starters has been reduced by the preliminary tests supervised by the Technical Committee of the A.C.G.B.I., and also by late arrivals at Alexandra Drive this morning. As a matter of fact, only thirty-one of the forty-nine entries actually appeared in

time; the two Rovers, the Rapid (No. 45), and the Gladiator (39) were late in appearing in the enclosure, and so were disqualified. Mr. Oscar Cupper's 24-h.p. Metallurgique was particularly unfortunate, for during an early spin a punctured tyre not far from Peel caused a delay, and the car could not return to Douglas till three-quarters of an hour after time. Much sympathy has been expressed with Mr. Norman Littlejohn, who drove a Vinot car into third place last year, and who has been disqualified because a mechanic drove over the course on Sunday. At the same time, as explained in the earlier message to-day, competitors have been warned, and "rules

Mr. S. Girling at the Wheel of the Darracq Car No. 3.

are rules." The hopes of the Vinot now rest upon Mr. Gordon Usmar's car. Going to the enclosure Mr. Leather's 16-h.p. Climax had the misfortune to sustain a broken change-speed gear, thus rendering it *hors de combat*. Yesterday the 18-h.p. Arrol-Johnston, which Mr. Campbell Muir was to have driven, broke its crank shaft and could not be repaired in time, thus robbing the event of much personal interest to the Manxmen, who remember Mr. Muir's efforts in Eliminating Races on the island. Mr. C. L. Cattell has been able to repair the damage to the James and Browne car in the collision a few days ago, and will be among the starters.

After the arrival of the cars the first test in connection with the event took place. Each car had to travel at the rate of twelve miles an hour on the top gear over a half-mile course. Only one car lost its chance in this trial, the engine of Mr. W. Parker Thomas's Argyll stopping and so taking that car out of the list of starters. Then a procession of vehicles returned to the enclosure, where the measuring of the cars took place, and the Peugeot (No. 22) chassis was found to be seven inches short of the regulation measurement between the dashboard and the rear of the tonneau.

#### Wednesday.

The way in which the officials adhered to the rules, strictly observing them throughout the whole of yesterday, is the subject of keen discussion, and the shrinkage of an entry of forty-nine to not more than twenty-nine possible starters is much remarked upon. Those left in the competition are satisfied that the risks of danger have been considerably reduced—a reflection, however, which carries little consolation to the drivers whose vehicles will not start.

Fortunately the weather continues fine, and everything promises well for to-morrow.

#### The Darracq Cars.

Above is depicted one of the two 15-h.p. Darracq cars which are taking part in the contest. The engine comprises four vertical cylinders 90 mm. bore by 120 mm. stroke, the normal speed being 1,200 revs. per min. The carburettor, which is of the float-feed spray type, is gravity fed; ignition is by means of the

ordinary system by coil and accumulators. The speed of the engine is controlled by a governor acting on the throttle, and by a lever on the steering wheel. The arrangement of the petrol tank to form the dashboard is a new departure of the Darracq Company. The transmission is through a leather-faced cone-clutch to the gear-box, giving four forward speeds and a reverse, and thence by a cardan shaft and bevel gear to the rear live axle. On the top speed the drive is direct. The cars have a wheel base of 8 ft.  $\frac{1}{4}$  in., and the cycle type road wheels are 810 mm. diameter with 90 mm. tyres at the front and 820 mm. by 120 mm. at the rear.

#### The Armadale Car.

The Armadale car, of which an illustration is given below, is not only a newcomer in the motoring world, but differs so greatly in design from the other vehicles in the contest that its non-appearance is a matter of regret. It is built by Armadale Motors, Ltd., and is fitted with a vertical four-cylinder engine, 92 mm. bore by 102 mm. stroke, and developing 16-h.p. at a speed of 1,100 revolutions per minute. The mixture is furnished by a Rover pressure-fed automatic carburettor, while the ignition is by coil and accumulators, a duplicate set being provided in order to be ready for any emergency. It is in the transmission that the novelty of the vehicle lies, this being by a friction drive by means of which any speed between the zero and the maximum can be obtained, without the use of a gear-box. On the rear end of the engine crank shaft is mounted a large disc; mounted on a shaft at right angles thereto is a leather-covered friction wheel, the position of which in its relation to the disc can be varied by a lever at the side of the driver. From the friction wheel shaft a Renold silent chain transmits the power to the differential shaft, which in turn is connected with the rear road wheels by side chains. The car has a wheel base of 9 ft. and is fitted with 815 mm. by 105 mm. road wheels. The makers inform us that they have

The Armadale 16-h.p. Friction Driven Car.

not in any way attempted to lighten either the chassis or body, the vehicle being an exact facsimile of their standard touring car.

IN connection with the recent rumour as to the restoration of the Parliament House in Dublin an Irish journal refers to the yard at the rear of the Bank of Ireland, where members of the old Parliament were wont to put up their old-fashioned vehicles when necessary. At a very small outlay for asphalt or cement this yard could, adds our contemporary, be converted into the most commodious garage in Dublin, if not in Ireland.

## SOME USEFUL NOTES.

ABOUT this time of the year a car is apt to show signs of use, if it has been run a good deal. This does not necessarily mean that the vehicle is not a good one; it simply means that a certain amount of wear and tear is inevitable, and, even if the car has not given a moment's trouble throughout the season, it should be looked over carefully to see how it has stood the work. Nuts may jar loose; cottar-pins may be lost; gears may be a trifle loose on their shafts; oil holes and pipes may be partly or wholly clogged; valves may be pitted and require grinding; steering gear joints may be, and probably are, loose, allowing excessive play at the wheel. The fact that a car has run for the whole season with little or no attention beyond oiling, cleaning and filling up tanks is all the more reason why it should be examined, as the owner may be lulled into a false sense of security by the good behaviour of his vehicle, while all the time something is gradually working towards trouble.

MOST motorists are familiar with the Lacoste type of contact maker, yet there are probably a few who have not been able to discover the cause of mis-firing troubles, either on one particular cylinder or generally. An examination of the contact maker may show it to be apparently in perfect order. After a long period of use, however, a certain amount of wear takes

## THE HURST SIX-CYLINDER CAR.

THE number of six-cylinder cars on the market is steadily increasing, one of the latest additions thereto being the Hurst, which is made by Messrs. Hurst and Middleton, Ltd., of Windsor Road, Holloway, N. As will be seen from the accompanying illustration, which gives a view of the vehicle fitted with a test body, it follows the general design of live-axle cars, the engine, which is rated at 30-40-h.p., being set in the fore part of a pressed steel frame. The motor, which is built throughout by the firm, comprises six separately-cast cylinders, the dimensions being 4 in. bore by 4½ in. stroke, and the normal speed 1,000 revolutions per minute. The valves are mechanically operated off separate cam shafts, the inlets being arranged on one side and the exhausts on the other. A separate exhaust pipe is provided for each cylinder, the burnt gases first passing into an expanding chamber, and thence to the silencer proper. The water circulation is maintained by a gear-driven pump and a framed tubular radiator of the firm's own construction, an air-inducing fan being also fitted. The mixture is furnished by a Longuemare carburettor with automatically-acting air-regulating valve, while the ignition is by coil and accumulators, the contact maker being located in an accessible position. No governor is provided, the speed of the engine being controlled by the throttle and ignition levers fixed above the steering wheel. The pedal operating

General View of the Hurst 30-40-h.p. Six-cylinder Car with Test Body.

place, both in the roller and other segments, and naturally the arm carrying the former will open out further by the action of the little spring. On looking very closely at the spring, it will be found that it cannot open out any further, because the middle portion of the arm is pressing hard on the boss. The remedy is to file out the boss—a matter of five minutes' work. The reason why this trouble is sometimes apparent on one cylinder only is due to the commutator shaft being not perfectly true, i.e., it is revolving with a very slight amount of eccentricity, and the point of the least eccentricity is where it "misses." This is a trouble the cause of which is not generally known, many motorists having been puzzled for a long time over it.

CARS which it is not intended to use during the winter months should be given a thorough cleaning before they are stored away, and all the bright steel parts should receive a coating of vaseline, to prevent rusting. The grease may be cleaned off again in the spring with paraffin. When the cars are thus prepared they may be stored in almost any building where they are protected from the weather, although a perfectly dry room is preferable. In any case, previous to storing the vehicle away, the tyres should be taken off, done up in sacking and stored in a dry, dark place, especially if the machine is to be out of commission during the entire cold season.

the clutch is, however, so connected up that as the latter is withdrawn the motor is automatically throttled down. To the gear-box the power is transmitted through a wide leather-faced clutch fitted with springs to allow the load to be taken up without jerks. Three speeds forward and a reverse are controlled by a single lever, the drive on the top being direct. From the gear-box the power is conveyed through a cardan-shaft and bevel gear to a live axle which has only the driving strain to withstand, the weight of the car being carried by the sleeve surrounding the axle. Any form of carriage body can be fitted to the chassis, which has a wheel base of 10 ft. 3 in. and 870 by 100 mm. road wheels.

A few days, ago with Mr. Hurst at the wheel, we enjoyed a short spin on the new car, and, although we were not able to test its capabilities as regards speed, we had ample opportunity of noting the great flexibility of the engine and the extreme quietness of the vehicle. In fact, on the top direct speed, on which the bulk of the running is done, one seemed to be simply gliding through the air, the engine responding instantly to the slightest movement of the throttle lever. Altogether Messrs. Hurst and Middleton are to be congratulated on their latest production, which is not only of a simple, straightforward design, but one in which the important points of reliability and durability have not been overlooked.

## SOME CURRENT TOPICS.

### A Substitute for Petrol.

In a recent issue we mentioned that some experiments were being made in the Midlands with a new fuel for motor-cars. The inventor is Mr. R. W. Ayton, of Stoney Stanton Road, Coventry, who in the course of a recent letter to us reports:—"It is quite true that I have been at work on the 'home-grown fuel' problem for a very long time, and have succeeded in securing most satisfactory results from a fuel consisting mainly of alcohol treated by a special process, which serves at one and the same time to increase the fuel value of the spirit and to render it permanently unpotable. Experiment has also plainly demonstrated the possibility of such fuel being satisfactorily utilised

sufficiently small that the time required to care for it is not beyond the owner's disposal, and working by degrees to a larger and more complicated machine. A large part of the time necessary to keep an automobile in running order is spent, not in work which requires the use of big tools, but in adjustments, and although the hours spent in the motor house slip by with amazing rapidity, the knowledge obtained is vital to the man who would run his car with economy. How much time will have to be spent to make oneself thoroughly acquainted with a car, or how much it would be profitable for a busy man to devote thereto, is a question the answer to which will depend on individual circumstances as well as on the particular car. Usually, the new recruit to the ranks of motorists has no idea on the subject, since he has no means of gauging how much he knows and how much he has to learn. It may safely be hazarded, however, that if he has the least inclination for the work and once makes a start he will become an enthusiastic student of the automobile and will take an active interest in the condition of the bearings, the change-speed gear,

A Wolseley Car among the Natives in Ceylon.

in engines of much simpler construction than those at present universally fitted to motor-cars. There appears to be no prospect, however, of doing anything with it in this country, so I am taking it abroad." In view of the ever-increasing cost of petrol, the problem of a home-produced fuel which shall render the automobile movement independent of the imported product becomes of national importance, and every encouragement should be given to any experiments towards its solution. We would, therefore, suggest that an inquiry into the fuel Mr. Ayton has devised might be included in the purview of the Fuels Committee which has just been appointed by the Motor Union.

### Every Motorist his own Mechanician.

Although it is not to be expected that everyone should be of a mechanical turn of mind, yet almost all motorists who have a reasonable amount of time on hand can make themselves acquainted with the main details of their car, the functions of the same and the care and attention they need. To do this means generally starting one's motoring career with a vehicle

the carburettor, the brakes, the steering mechanism, etc., of his vehicle. If the motor stops on the road—which it seldom will, if properly kept in order—he will know at once whether the fault is in the carburettor or the ignition, and a few minutes will suffice to narrow the field of search still further. As with the engine so with the other parts of the car—after a little experience the owner will know where trouble is most likely to occur. The intimate acquaintance with the car that results is well worth the trouble, if only on account of the sense of security and confidence it affords when on the road. Not only so, but, even where a professional driver is employed, a knowledge of the various parts of a motor-car will be found exceedingly useful, enabling, as it does, an owner to keep a check on the chauffeur and to see whether he is keeping the machine properly tuned up, and if not, in what respect he is neglecting it. And above all he will have more than a vague idea of what his car will and will not do, and therefore refrain from overtaxing it, the result being a saving of repair bills and many roadside *pannes*.

## THE ADJUSTMENT OF TREMBLER COILS.

AS so much depends, in the successful operation of the high-tension system of ignition by means of an induction coil and accumulators, on the adjustment of the tremblers of the former, and as we believe the method of properly adjusting the same is little understood by the average motorist, we recently asked several of the leading coil makers to give the readers of the *M.C.J.* the benefit of their expert knowledge in the matter. From the following letters many valuable hints will no doubt be

Figs. 1 to 4.

gathered, and by following the instructions given automobilists should be able to obtain better results from their ignition apparatus if, perchance, they have experienced difficulties through faulty trembler adjustment.

### The V. R. Coils.

Messrs. Van Raden and Company, Coventry, write:—In the following instructions we endeavour to explain the necessity of speed of trembler, above the old theory of the heat of spark obtained by large current consumption, which causes rapid exhaustion of accumulator and all the accompanying ignition trouble. All our coils are fitted with the genuine Carpenter trembler, consisting of two main parts—the current conducting (platinum tipped blade and screw always in contact when at rest), and the hammering blade, which is attracted by the magnetised core immediately the current is closed. As shown in illustration No. 1, these two blades are in the normal position; both blades are parallel, with little space between them, so that the hammering blade, when attracted by the core whilst magnetised, is able to give a sharp blow on the contact blade, separating the platinum tips, breaking the low-tension circuit, and thus producing the high-tension spark. In the second illustration the platinum tip screw is over-adjusted, the blade is bent down, the distance between the two blades too large, therefore the time lapsing before the blow and consequent break takes place is much longer, thus slowing down the action, making the trembler slow and extravagant in current consumption, because the resistance in the primary has to be fairly low. Fig. 3 represents a trembler blade bent upwards, the screws released, the hammering blade too far from the core, the spring slack, no quick return, blade too far from the magnetic influence of the core again slowing down the trembler speed.

The fourth illustration shows a badly over-adjusted trembler, in which the tipped blade is pressed down below the core, so that the hammering blade cannot reach it to separate the contact, causing the sticking of the hammering blade; when adjusted like this the trembling coil is used as a non-trembler, the spark takes place at the latest possible moment when breaking at the cam, and the coil uses an abnormal quantity of current.

Before there is any trouble with coils it is well to remember that the best method *not* to make the coil work properly is by screwing down hard, by pulling the blade and spring out of shape so that they cannot tremble, weakening the spiral spring which is intended for quick return. Another and even better method to ruin coils is to send the largest amount of current through it and then to increase the spark gap to such an extent, or disconnect the plug wire altogether, so that the spark has to jump inside instead of outside the coil. The custom, under these circumstances, is to blame the coil maker after the car comes to a stop instead of taking his advice in time. Leave the coil

adjustment alone—coils rarely require adjusting; as long as they are in good order do not experiment, you will often find your ignition trouble in over-lubricating, in your carburettor, and in contact breaker, after you have seen the accumulator is well charged and that the trembler vibrates lightly. Only the platinum tips occasionally require trimming with a very small file, and afterwards with a light hammer to get a hard, smooth, bright surface. Care must be taken that the tips touch level over a large surface, otherwise they will point and stick.

### The P. and R. Coils.

As regards the P. and R. coils, Messrs. Peto and Radford, the makers, inform us that when properly adjusted they should show very little sparking at the platinum contacts. If excessive sparking occurs it is either due to the wear on the platins putting them out of parallel, or the formation of points and craters on the surfaces. To adjust these, slacken the lock nut, remove the contact screw, and file up the surfaces with a superfine cut file until the platinum points of both blade and screw have a perfectly level surface. The filing should be done gently and the file held firmly, so that a straight surface is produced. Persons unskilled in the use of a file are apt to file off the corners and produce either a slanting or a convex surface. Therefore it is best to acquire a certain amount of experience before attempting the job. A very small adjustment of the screw will make a considerable difference to the character of the spark. The spring should be about  $\frac{1}{8}$  in. from the iron core, and the armature should rest on the spring so as to be just free and not pressing on it. To get this result adjust the small screw in the brass piece that holds the armature down. By altering the adjusting screw the current can be varied from  $\frac{1}{2}$  to  $2\frac{1}{2}$  amperes, and providing that a sufficiently efficient spark is obtained, the adjustment should be made so as to use as little current as possible, as it reduces the wear on the platinum points. In testing induction coils the primary circuit should not be joined to the terminals of an accumulator, unless there is a proper path connected up for the secondary spark. This can either be done by connecting a sparking plug to the coil, or by providing two pieces of wire with a gap of about  $\frac{1}{4}$  in. between them. If the gap is not provided, a great strain is put upon the coil, and the spark may break out at any weak point in the internal insulation.

### The E.I.C. Coil.

From the Electric Ignition Company, Ltd., of Sparkbrook, Birmingham, we have received the following:—The E.I.C. induction coil is the result of many years' experience in the

Fig. 5.

manufacture of these articles. The windings are special in form and differ in many ways from the ordinary type. A particular method of balancing the primary and secondary winding with the condenser gives a minimum of sparking at the contact points of the trembler, so reducing the fusing of the platins to a minimum. After much experimenting we have obtained a special alloy of platinum, which is extremely hard, and this prevents the points hammering down owing to the continued action. As regards current consumption, the E.I.C. is so constructed that it only takes from .2 to .5 amperes, according to the speed of the engine. The tremblers rarely need adjustment, but when this is necessary it can be carried out very easily. All that it is necessary to do is to unscrew A, Fig. 5, about three turns; this loosens the screw B, which should then be screwed down until the trembler is buzzing at its highest note. When this is done screw up A again and so lock B securely, the trembler being then adjusted to run at its highest speed.

## CONTINENTAL NOTES.

### The Provence Speed Trials.

On Tuesday last week the Automobile Club de Salon held a series of kilometre and five kilometre speed trials on the Salon-Arles road. The interest in the racing car section was reduced by the non-appearance of several of the entries, including Rougier (De Dietrich) and Garcet (Clement-Bayard), Collomb running alone on his 110-h.p. Rochet-Schneider. His time for the flying kilometre was 25 1.5 sec., equal to 90 miles per hour, and for the five kilometres 2 min. 11 1.5 sec. Both times were, however, outside record. Tadeoli also did well on a Rochet-Schneider in the over £800 class, his times for the kilometre and five kilometres being respectively 31 sec. and 2 min. 36 sec. Gasté on a Radia was the winner of the under £500 class, he covering the long course in 3 min. 18 3.5 sec.; over the kilometre, however, he was beaten by Aubert on a Mieuisset (41 2.5 sec.).

### The Semmering Hill Climb.

The annual hill-climbing competition from Schottwien up the Semmering was held on Sunday last over a ten kilometre

permits, paragraph 110 of the law states that the five or thirty days for which the permits are valid need not necessarily be consecutive days; the permit, therefore, should be produced on every occasion that the frontier is crossed, and laid before the customs officials, to allow of the entry or departure from the country being exactly noted. Such notices should contain the identification letter and number of the automobile, and the number of days passed in the country. It is not necessary that the frontier station at which the entry into Germany is made should always be the same, and visitors who meet with any difficulty on this point should refer the customs authorities to paragraph 110 of the regulations.

### Public Services in Germany.

Arrangements are in hand for the establishment of a public motor-car service between Zittau and Oybin, Saxony. A company has also just been formed in Potsdam to establish and work a service of motor-buses in the district.

### Miscellaneous Items.

The names of Argyll Motors, Ltd., and the Enfield Auto-car Company, Ltd., appear in the list of exhibitors at the forth-

Touring in France.—The Pont la Feuillée, at Lyons.

course. Close upon fifty entries were received, the competitors being divided into several classes. The best time of the day was made by Braun, who drove Herr A. Dreher's 100-h.p. Mercedes up the hill in 7 min. 40 sec., beating last year's record, held by himself, by 10 4.5 sec. In the light racing motor-bicycle class Wetzka on a Puch won in 10 min. 13 sec., while in the light racing car section the winner was Joerns, his time on an Opel-Darracq being 8 min. 46 sec.

### Motor Touring in Germany.

As a considerable amount of uncertainty exists regarding the taxation of automobiles entering Germany, and the term of duration of the permits which have to be taken out at the frontier customs stations, the German Imperial Automobile Club has issued the following notice:—The automobile tax law, which came into force in Germany on July 1st last, stipulates that permits (tax cards) must be taken out for the cars of motorists living abroad. The taxes to be paid are as follows:—For a sojourn in Germany not exceeding five days 15s., and for a stay lasting from five to thirty days £2 for each vehicle. These permits are issued on the payment of the dues at the German frontier customs houses. In regard to the duration of such

coming Paris Salon.—The annual hill-climbing competition at Gaillon, France, is to be held on the 28th October.—The Swiss Automobile Club is organising a hill-climbing competition for October 14th; it is to be held over a six-kilometre course on the Marchairuz Hill, near Geneva.—In addition to a 40-h.p. six-cylinder car it is reported that the Darracq Company is bringing out a new 7-h.p. light car for the 1907 season.

THE value of the exports of motor-cars and parts from the United States during July last amounted to £102,635, as compared with only £45,106 in the corresponding month of last year.

MESSRS. DENNIS BROTHERS, LTD., have lately completed a double-deck motor-bus for a service between Carmagnola and Pinerolo, in North Italy. The bus body was constructed by Messrs. E. and H. Hora, Ltd.

MESSRS. HARVEY FROST AND CO., LTD., have added another name to their list of distinguished patrons, as they have received an order from the chief of the Imperial Garage, New Peterhof Palace, St. Petersburg, to supply the Czar with a "Standard" vulcaniser and a complete set of H.F. materials and tools.

WE learn that during the past three months the London and Parisian Motor Company, Ltd., have despatched ten Vulcan cars to New South Wales.

MR. J. WELCH has opened a garage at North Street, Mere, Wilts. The new establishment, with accommodation for ten cars, is on the Salisbury road.

WE learn that Sir Thos. Hanbury has lately ordered a 24-40-h.p. Itala car from Itala Automobiles, Ltd.

A NEW depot for the sale of cars and accessories is being established at 308, Euston Road, London, N.W., by Messrs. Gutteridge and Zambra, Ltd.

MR. H. R. POPE, of the Itala Automobiles, Ltd., is, we hear, about to make an attempt to establish a new record between Monte Carlo and London on his Itala car.

A MOTOR-BOAT capable of carrying about sixty passengers is being built by a syndicate of local fishermen for use next season at Bognor in making trips to Selsey Bill, Littlehampton, and the Owers Lightship.

THE china and earthenware manufacturers of the Potteries have just commenced a motor service for the conveyance of goods to Liverpool for shipment. This step has been taken in consequence of the high rates charged for transit on railways and canals.

THE motor-car works of Messrs. F. and J. Grant, Cathcart, near Glasgow, have been destroyed by fire. It is said that a member of the firm, having lit a cigar, threw a match on the floor amongst some petrol, and an explosion followed. The damage is estimated at £5,000.

MESSRS. J AND P. HILL, engineers, Park, Sheffield, have recently introduced a new high-speed screw-cutting lathe, specially designed for the automobile industry. The lathe, which is made with 8½ in. and 10 in. centres, is constructed for turning out work at high speeds.

Said a judge in a Court of West Ham,  
"I'm most open-minded, I am,  
But everything new  
I steadfastly eschew,"

And the motorist simply said—Thanks.

W. A. C., London.

MESSRS. R. REYNOLD JACKSON AND CO., LTD., have sent us an interesting photo, showing no less than a dozen Jackson cars built for the Planters' Stores and Agency, Ltd., Calcutta, India, and Messrs. Trackson Bros., Brisbane, Queensland, the orders being executed in about one month after the receipt of same.

LIEUT. S. GORE-BROWNE, of the Royal Artillery, Deepend, Surrey, will be glad to hear from motorists able to assist in obtaining a reliable second-hand car, to be utilised in connection with a scheme for training men of the Royal Field Artillery, so that they may be qualified as motor-car drivers on returning to civil life.

FROM Leicester comes the splendid list of the Midland Counties Motor Garage Company, whose premises are well located in Granby Street, opposite the Grand Hotel. The garage is of good extent and equipment, and the workshop well fitted with all the necessary tools for motor repairs. The tyre stocks, as well as those of accessories, are large and comprehensive, and, taken altogether, this establishment is calculated to be of service to any motorist journeying through the town of Simon de Montfort.

A NEW shock absorber, known as the Elsworth Victor, has just been brought out by Elsworth Motors, Ltd., Bradford. The device, which can be easily attached to either the front or back wheels of any car, consists of a phosphor bronze casting, into which is fitted a leaf working from side to side in oil. When the car receives a shock or bump the wing valve permits the oil to flow easily past the leaf, but when the rebound of the vehicle occurs, the oil being regulated by a stop valve, is permitted only to flow slowly back through a by-pass to its original position, thus checking the recoil and ensuring a perfectly smooth motion, at the same time preventing the breakage of springs.

## HERE AND THERE.

THE American Association of Licensed Automobile Manufacturers has just adopted a number of standard sizes of nuts and bolts for use on motor-cars.

MESSRS. CHATER LEA, LTD., of Golden Lane, London, E.C.,

have established a department for the cutting of all varieties of spur and bevel gears, and are prepared to undertake any work of this kind, supplying new parts or replacements.

ON Monday next the order of the Local Government Board limiting the speed of motor-cars to ten miles an hour on the highway in parts of East Retford comes into operation.

MESSRS. FRISWELL, LTD., have purchased the entire stock of Benz parts formerly held by Messrs. Hewetsons, Ltd., and are prepared to supply these promptly as well as to execute repairs to Benz cars.

THE Acme Rubber and Tyre Company have a well-equipped establishment at 343, St. Vincent Street, Glasgow, where they deal with the fitting of non-slipping treads and the repair of tyres from all parts of the country. From the specimens of Egyptian cloth and rubber which have been submitted to us it is evident that the materials employed in the repair of tyres are of high grade likely to give confidence to the firm's extending clientele. One feature of the business is the guarantee of

re-repairing, free of charge, any cover that proves defective within three months' of leaving the works—certainly an assuring phase of the motor repair business. The emergency garter which the firm introduced at the Motor-Car Exhibition at the Agricultural Hall is increasing in popularity, and those who have not yet had satisfactory tyre repairs in their own locality may communicate with the Acme Rubber Company, of Glasgow.

A FIRST-AID Pocket Ambulance case has been brought out in a very convenient form by Messrs. Wilson and Stockall, of Bury. In the little tin box are bandages, plaster, boracic lint, wool compress, needles, pins, sal. volatile, and a few other necessary items in connection with first aid. The case should be regarded as part of the motorist's outfit.

THE Coventry Motor Fittings Company have now removed to their new premises in Gosford Street, Coventry. This factory has been specially built to suit the requirements of tin-plate workers to the motor trade, and due regard has been given to lighting and ventilation, as well as the extension of premises when that becomes necessary. Machinery is being driven by electric motors, and sufficient accommodation is provided for 200 men. This firm's special lines are honeycomb radiators, lubricators, petrol tanks (pressure feed and otherwise), &c. As a precaution for safety all radiators are tested under hydraulic pressure before leaving the works.

A CONTEMPORARY refers to an "automatic change-speed petrol-paraffin carburettor!"

THE L.C.C. have sanctioned the letters A. R. E. O. as the trade identification mark of the Reo Motor Company.

MR. CAMERON CORBETT, M.P., has lately acquired a Delaunay-Belleville car from the Great Western Motor Company, Ltd., Glasgow.

OWING to the large increase in their business, the Crypto Electrical Company have removed to larger premises, 155 and 157, Bermondsey Street, London, S.E.

MESSRS. L. RENE AND CO., LTD., 8, Plum Tree Court, E.C., have, since the fire on their premises, obtained a new stock of tyres, &c., to which the attention of motorists is directed.

AT 8, Wood Street Square, E.C., Messrs. Tidman and Gough have established an agency for automobile specialities in clothing, notably leather and tweed garments, liveries for chauffeurs, combination suits, motor-gloves, non-skids, &c.

THE Manhattan Dental Company, of New Times Building, New York, have sent us particulars of their non-fusing platinoid, which they claim to be a perfect substitute for platinum. It is stated to be well adapted for use on coil tremblers and other contacts in connection with electrical ignition systems.

JAMES NEALE AND SONS, LTD., Graham Street, Birmingham, have recently brought out an improved side and tail lamp. The special features concerning their side lamp are a patent

bolt fastener for locking in the oil container. This is mere or less automatic in action, and is easily manipulated and perfectly secure. The bracket is exceptionally strong, and riveted in four places over a large area of the body of the lamp, so that there is no fear of the metal cracking or breaking away. The wick is kept in place by a ratchet arrangement. The hinge of the lamp door is secured by rivets, and the door itself is detachable by means of a cottar inserted through the hinge. The reflector is properly focussed, and the lamp gives a strong light. The device has a goodly appearance, and is well and substantially made. It is known by the name of "Raydyot." The "Raydyot" tail lamp is made on similar

lines to the foregoing, and, in view of the coming new regulations, is somewhat larger than the ordinary size, so as to give a larger area of light. This lamp is also fitted with the firm's patent bolt fastener and special attachment to prevent the wick jolting down. A white light can be seen at the side, so that the driver by the turn of his head can see whether his tail lamp is burning. Messrs. Neale and Sons also deal largely in bearings, hood joints, wind shields, door handles, door plates, angle plates, bonnet fasteners, canopy fasteners, &c.

THE Petersfield Rural District Council have petitioned the Hants County Council to obtain the necessary power to make a by-law to impose a penalty on the users of motor-cars which create dust to such an extent as to be an annoyance or a nuisance to people using the roads or living in premises adjoining.

A CASE heard at Lincoln against Mr. C. Hannam for furiously driving a motor-car illustrates a strange order of magisterial mind. It was alleged by the prosecution that he was travelling about ten miles an hour; the defendant declared his speed to be less than half that pace, but the magistrates, after declaring it to be "a difficult case," added that, "taking all circumstances into consideration, the pace was furious and dangerous, although Mr. Hannam had not neglected to take precautions." So he was fined 40s. and costs. Truly a wonderful people, the English.

MR. W. TAYLOR has opened a motor garage in Stretford Road, Urmston, near Manchester.

CANNOT the A.C.G.B.I. see to the danger sign it erected on Birdlip Hill, so that it may be restored to its early usefulness?

A NEW motor-car repair establishment has been opened at Birmingham—at 12½, Belgrave—by Mr. James Lewis, who has had much practical experience with leading makers.

THE Ripon (Yorks) Rural Council have decided to forward to the County Council a list of places in the district where, in their opinion, motor-car danger signals should be erected.

SIR JOHN HIBBERT has associated himself with the scare raised by Sir J. Crichton-Brown, and has been deploring the increase of lunacy, "due, no doubt," he says, "to mental anxiety, even in amusements, such as motoring and cycling."

MOTORISTS journeying to Boulogne or Calais should consult Major Stevens or Captain Blomefield respectively with regard to the conveyance of their cars, these gentlemen being the accredited agents of the English railway companies at those ports.

ON the Skegness sands the one mile scratch race was won by a 35-h.p. Daimler fitted with Continentals, and in the Snake Hill climbing contest of the Manchester Motor Club Mr. J. Arrowsmith's 20-h.p. Horbick, which was first in Class D, was similarly tyred.

ON behalf of Rene Thomas, the French motor-cyclist who met with a serious accident at the race meeting at Canning Town on July 14th, and who is still an inmate of the Poplar Hospital, a Bohemian concert will be held at Frascati's Restaurant, London, W., on November 12th.

THE prices of all descriptions of the Bowden wire are to be reduced from Monday next, to enable dealers to cater for all requirements. The mechanism will thenceforth be obtainable in practically any desired length, instead of being supplied only in certain stated lengths, as has hitherto been the practice.

ON Saturday last Dougill's Engineering, Ltd., submitted one of their Frick 20-h.p. 22-seated char-a-bancs to a 30-mile road test. The vehicle, which is one of a number they have on order for Egypt, is friction-driven, by means of which any speed from zero to maximum is obtained without the use of a gear-box.

THE Marsh Motor and Cycle Works, London Road, High Wycombe, whose depot is located on the main London to Oxford road, are now catering for the requirements of motorists. A good store of petrol and oil is kept, while repairs of all kinds, including the vulcanisation of tyres, can be quickly carried out.

MESSRS. J. W. BROOKE AND CO., LTD., of Lowestoft, are supplying Mr. L. V. Harkness, of New York, with two exceptionally well-finished motor-launches for his new 1,000 ton s.y. Wakiva. The owner's launch is to be 25 ft. long, built of mahogany and equipped with a six-cylinder Brooke motor. The crew's launch is 20 ft. long, equipped with a three-cylinder 12-h.p. Brooke motor.

MR. ROBERT SCAIFE has been appointed manager of the Automobile Department of the York Electrical Co., Ltd., whose works and garage are at Wellington Row, Lendal Bridge, York. The works are well equipped with machine tools capable of dealing with all classes of automobile work, and as the garage will be open day and night, it should prove a convenience to motorists passing through the cathedral city.

THE Wilkinson Tyre and Tread Company, Ltd., of Huddersfield, have issued a new price list of their patent "Duplex" motor-tyres and plain and non-skidding treads. The "Duplex" type is practically a double tyre, a bed or lining of rubber being vulcanised to the inner surface of the casing, thus leaving the casing embedded in rubber and sealed between two flexible or resilient bodies. The vulcanising of the rubber to the inner face of the casing retards the spread of moisture following a puncture. The Wilkinson "Cupstud" tread, which has proved very satisfactory in service, comprises a rubber and canvas tread enveloping the outer cover. Hardened steel cups are provided to take the wear, through which the patent studs are fixed and made secure on the inside of the tread, so as not to have any projecting metal against the outer cover. Durability as well as effectiveness is a characteristic feature of these studs.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
87-89, Charing Cross Road, W.C.]

### IMPERFECT LUBRICATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Many motorists are apparently not aware of the fact that many of the troubles they experience in connection with their engines arise from imperfect lubrication. This is especially noticeable in hill climbing, where the oil naturally runs to the rear end of the crank case, and by the time that the top of the hill is reached a portion of the forward end is quite dry, and, consequently, there is a falling off in power which is wrongly attributed to the defective capacity of the motor, but which, in fact, arises from the forced dryness induced by the absence of

of the engine. Nearly all cases of loss of compression past the piston bad valves, commutator troubles, explosions in the carburettor, and numerous other troubles of like nature, may be traced to insufficient lubrication.—Yours truly,

T. BUCKLEY.

### THE DUST NUISANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Motors have come to stay, and it is as useless for the "man in the street" to try to do away with them or to reduce their number as it is to cry for the moon. What must be done is to lessen the evils caused by motors generally by indirect means. The chief of these evils is undoubtedly the "dust problem;" such features as noise and insufficient control of machines are best left to experts and the motor trade generally, who, one may be quite certain, are trying their best to remedy for their own pockets' sake.

My proposal for the prevention of the "dust curse" is to prepare the roads with tar or other material. This, your readers will say, is nothing new; but I ask them, has it ever been done systematically? We don't

The Austrian Military Manœuvres.—Prince Alexander Solms-Braunfels, the Commander of the Austrian Motor Volunteer Corps, on his Mercedes Car  
[Allgemeine Automobil Zeitung.]

oil. Normal lubricating conditions exist only on level roads, and deviations of any extent from the level should immediately be met with an extra supply of oil at the necessary parts. It is noticed that blue smoke invariably accompanies hill-climbing. This arises from one or more of the cylinders being swamped with oil, while at the same time the forward pistons may be dry and binding in the cylinders. Many cars are now being made with separate feed pipes to all important bearings, so that the simple splash of the cranks of an ordinary multi-cylinder engine is not entirely depended upon as the sole means of cylinder lubrication.—Yours truly,

R. TOWNSEND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am very pleased to see that attention is being drawn to the question of lubrication. Many motor troubles may be traced to lack of attention to this point. People are too much inclined to drive a machine as long as it will run, regardless of the condition of the bearings and other wearing surfaces. The result is that certain parts of the motor become worn, and soon a knocking develops which creates a large amount of vibration, and causing a rapid deterioration

want it in patches, "here a little, there a little," but all the main roads should be prepared, and, in time, the second and third class roads. As to the means to obtain this result, I say, tax the motorists, not with such an absurd burden as £50 per year, as some correspondents suggest, but, say, £1 per head. The cost of preparing the roads with tar is about £70 per mile; thus the main London to Brighton road could be done for its entire length for £4,000. If the above taxation would not be enough to meet the requirements, tax the ordinary bicyclist 5s., or even 1s. per annum for the privilege of riding on perfectly smooth roads, free from dust. By this means surely a sufficient sum could be raised every year for the proper maintenance of, at all events, the main roads.—Yours truly,

H. W. W.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—From a careful perusal of the correspondence appearing in most of the leading "dailies" on the motor problem, it is apparent that the chief ground of complaint against motors is the dust nuisance.

No doubt in time we shall get our dustless roads, when due consideration has been given to the problem by road engineers, and their

suggestions have been carried into effect by local councils; but in the meantime may I suggest that it would not be unfair to call attention to the fact that there are at present certain cars on the market which, owing to their design, cause a minimum of annoyance on this score?

The Turner-Miesse car comes in this category, and, driven at a speed up to twenty-five miles per hour, raises but little dust, and is practically free from offence. This I think is due to the fact that the Turner-Miesse is built fairly high—there is no engine fly wheel revolving at great speed near the ground, and there is no exhaust being perpetually sent with great force on to the dusty surface of the roads.

The opponents of steam are never chary in expressing the objections they have to the older motive power, so I venture to think it is only just and right to give credit to steam where it can fairly claim decided advantage, and I think the comparative freedom from giving offence in the respect I have indicated is by no means unimportant.

In addition, there is absolutely no offensive exhaust.—Yours truly,

J. BURNS DUMBELL.

### TAIL LAMP TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I can sympathise with Mr. Elwood, whose letter appears in the last issue. My experience on this troublesome question of tail lamps is that a large proportion of the difficulty commonly experienced by motorists in keeping the light burning properly is due to the quantities of dust and dirt in which it is constantly being smothered while the car is on the road. No matter how carefully the lamp may have been made, the air inlets to the same are bound sooner or later to become more or less clogged. This, naturally, tends to impair the proper action of the burner, which is further affected by the dust which works inside and settles on the wick, effectually preventing the capillary action on which

Mr. E. P. Prestwich and his 30-h.p. Daimler Car, which he has driven 6,000 miles without opening the tool-box on the road, and without puncture or tyre trouble of any sort.

the flame depends. A simple method of preventing this during the time the lamp is not in use is to employ a removable lamp cover of waterproof material. The lamp may even be entirely removed when not in use, and stored in some place on the car where it will be free from the dust.—Yours truly,

F. DICKINSON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I ask Mr. Elwood if he has tried a cover for his tail lamp when not in use? At first sight this may appear a frivolous query; but when it is considered that a tail lamp is in a whirlwind of dust and dirt continuously, both air inlets, ventilation and wick get choked with particles of dust, and no lamp made will burn under such conditions.

I had the same trouble as Mr. Elwood and always had the nervous dread that my tail lamp was not properly alight. Since taking the precaution of always having a lamp cover on, except when the lamp is lighted, I have had no trouble and drive with the confidence of a good clear light at rear.—Yours truly,

C. ASTBURY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your correspondent, Mr. H. Elwood, I may say that I have experienced similar troubles myself, and I have never been able to obtain thorough satisfaction from oil lamps. I have now

fitted up two 2-volt "Osmi" lamps, one on the dashboard and one in the tail lamp, burning in series off a 4-volt accumulator. The lamp on the dashboard, which must be shaded from the driver's eyes, serves both as a telltale device and to throw a light on the drip sight feeds of the lubricator. This device has been in use on my car about 4,000 miles, and has never failed upon any occasion, the only trouble being caused through the accidental breakage of a globe. I find that the "Osmi" 2-volt globe is the only lamp of that voltage which gives sufficient light to illuminate the number plate. The accumulator (40 amp.) requires recharging once every fourteen days, using the car five nights a week. In conclusion I may say that I consider the freedom from the anxiety of tail light trouble has amply repaid the cost and work of fitting up this system.—Yours truly,

PERCY E. WHYTE.

### IGNITION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be greatly obliged if you could help me with the following:—I have a 12-h.p. two-cylinder car, and am much troubled with short circuiting on the high-tension wires from the coils to the sparking plugs. I may say I have fitted new E.I.C. plugs and the very best high-tension wire I can get, and even now wherever the wire touches the frame or engine you can see the electricity running along the wire.

I have some non-trembler coils on same, which have been in use some time. Do you think if trembler coils were fitted it would get over this difficulty? When the plugs are out they both spark beautifully.—Yours truly,

T. L. W.

[The cause of the trouble must lie in the fact of there being an earth leakage at some point between the terminal on the coil and the plug, and as the high tension wire is of good quality, and the plugs are new, probably there is a leakage, caused through damp, between the coil terminals and the wooden case. Fitting tremblers would have no effect, but a new coil with tremblers would no doubt remove the cause, as the leakage would be done away with. There is also a chance of leakage in the plugs through the mica insulation. When the plugs are taken out they are no longer sparking under compression, so that a spark would pass in spite of the leakage. Dampness will often cause corrosion at the back of a high tension terminal; this will spread across the ebonite insulating bush piece, and if the wood work of the box is wet the mischief is done.]

### DANGERS OF THE ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a cyclist of twenty-five years' standing, it seems to me that so long as motor vehicles are allowed to use the roads at the present speeds, accidents, especially to children, will happen, and the only way to guard against these in some measure is to compel all local authorities to have proper paths made to every road, and to have a light railing with crossing places in villages and hamlets.

There are many roads and lanes within ten miles of London where there is no path of any kind, and often high banks on each side, and this ought not to be allowed unless motor traffic is prohibited.

With reference to the recent accidents to children running from behind carts, all experienced cyclists know that this is one of the dangers of the road to be specially guarded against by extra vigilance, slowing down, and sounding a bell, and unless these precautions are taken I fail to see that an accident caused to a child can be held to be unavoidable. Too much stress is laid by those interested in the great stopping power of the brakes on motor-cars; doubtless this is true, but if they are not applied in time they are useless, and how many drivers are there equal to a sudden emergency?—Yours truly,

J. RAY FLINT.

### STEAM CAR EXPERIENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to hear some expressions re steam motor-cars from users who can speak from a lengthy experience. I am a medical man in a very hilly country with bad roads. I have used a petrol car for eighteen months with varying luck. Is a steam car (once steam is up) as easy to start as a petrol car? Is it more economical? Does the engine last longer? Are steam cars more difficult to keep in order, and do they require more attention than petrol cars? And lastly, what power car would do my work? I do not want to go fast—twenty-five miles on level, but might want the car to carry a landaulet body.—Yours truly,

MEDICUS.

### THREE MEN ON THE 'BUS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent who wants to alleviate the unemployed problem by setting 600 or 700 boys to work on the London motor-buses certainly raises a point worthy of discussion, though I am not inclined to wholly support his views. That drivers cannot attract passengers is true; and that conductors are often oblivious to the

attempts of would-be passengers to secure notice is equally correct. But the motor-bus business is still young and as its organisation develops its points of perfection will become more apparent.

Now that the police are seeking to confine their licences to the right to run over specified routes the time seems opportune for giving each bus its own stopping point—so far as taking up passengers is concerned. It would be easy to so arrange matters that a motor-bus stopped at every street end in London—I am, of course, only referring to the busy parts of the metropolis—to secure passengers. Thus everyone could be accommodated without the dangerous practice of whirling umbrellas through the air, to the risk of damage to the visages of people within the radius of the circle. As motor-buses become more plentiful such a plan would be very feasible, and I do not see why each bus should not have its own special stages where they are known to stop. Of course we have something of the kind here; but I want to see the short stages that are current in Paris rather than the long intervals with which we have grown familiar in London.

I was glad to see that in the editorial columns of last week's issue you drew attention to the dissimilarity now existing in the height of the steps of motor-buses from the ground. This is a real danger, and the sooner the Society of Motor-Bus Engineers seeks to impress the importance of the point on its members the surer will be the progress of the motor-bus into popular estimation—a state of being from which it is now very distant.—Yours truly,

T. TURNER.

### MOTORISTS AND INSURANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is no doubt a disinclination on the part of the majority of motorists to insure against accidents, and apparently this is partly due to a belief that there is always a difficulty in obtaining a settlement of claim in the event of an accident. That this is not the case with a good company is shown by my experience. I had the misfortune to be the victim of a rather bad smash. I sent in my claim to the General Accident Assurance Company, Ltd., on Tuesday, and this morning, Thursday, received a cheque for the amount.

Such promptness is much to be commended, and should be an inducement to motorists to take what is certainly a wise step and insure.

I have no interest in the insurance company mentioned.—Yours truly,

NORMAN A. LETTS.

### STOPPING A CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In driving into a garage I remove my interrupter plug, thus stopping my engine, and bring the car to a standstill by letting up the clutch when still in gear. Is this likely to do any damage to the car or gears, and in what way?—Yours truly,

TONY HUBER CAR.

[The method of stopping a car mentioned by our correspondent is not usually practised. If the clutch is let up whilst the car is still in motion and the engine at a standstill it would cause a severe strain on the gears and car in general. The usual method is to bring the vehicle to a standstill usually by means of its brakes, the gears being put into the neutral position, when engine can be stopped as desired. If the principle referred to by "Tony Huber Car" be adopted, some difficulty may be experienced in getting the gears through to the neutral, especially if they are of the Panhard type.]

### THE QUALIFICATION OF DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The primary cause of motor accidents is due to incompetent driving, and now must be added the danger of meeting a car that may be in charge of a cripple, madman, or mute.

May I point out through your influential journal that it is about time some steps were taken by the licencing authorities throughout the country to ascertain if applicants for licences to drive motor-cars are physically qualified to do so?—Yours truly,

J. MACCONNELL.

### THE CAUSE OF CARBON DEPOSIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you or any reader of the *M.C.J.* could inform me as to what causes the carbon deposit on the pistons of petrol engines. Is it due to too rich a mixture of petrol, or to too much or poor lubricating oil? Is there any way of dissolving, burning out or removing the deposit other than by dismantling the engine and scraping the piston head and cylinder?—Yours truly,

R. LEWIS.

[Carbon deposit in cylinder is due to the burning of the lubricating oil, combined with that of the petrol. It has not much to do with the

quality of lubricating oil, although a poor oil will cause a greater deposit. It is almost impossible to remove it without dismantling, but if the cylinders are frequently washed out with paraffin or petrol the formation of the deposit is to a large extent avoided.]

### TYRES AND TARRED ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On returning from a run the other day I noticed that my tyres were covered with tar, not only on the treads, but on the sides. I am, of course, glad to see the authorities in different parts of the country tackling the dust nuisance by tarring the roads, but the question is whether tar is injurious to the tyres of motor-vehicles, and, if so, what can be done to obviate it. Perhaps some reader of the *M.C.J.* can give a few hints on the subject.—Yours truly,

A. MACKENZIE.

### BACKFIRING IN THE CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I noticed in a recent issue a reply from Mr. R. J. Robinson re backfiring in the carburettor. He states that an engine will backfire if the accumulator is low or the plug is broken, and if the contact-maker is too long. For the benefit of myself and possibly other amateur motorists, would it be imposing on your valuable space to ask Mr. Robinson how those defects mentioned would cause backfiring, as I have found from experience that a weak spark from a low accumulator gives a late explosion, and to have a backfire savours of premature ignition, or the inlet valve not closing quick enough.—Yours truly,

A. J. S.

### SPERM OIL AS A MOTOR LUBRICANT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to your article on this subject under "Some Current Topics," in the *M.C.J.* of the 15th inst., and also R. J. Hutchinson's letter, may I take the liberty of stating that the chief objection to the use of sperm oil is not one of viscosity or of price, but simply that sperm, being an animal oil, will not distil as will a mineral oil, but will

An 18-h.p. Star Car with side-entrance body and canopy.

decompose, giving off a most offensive smell, and will leave a heavy deposit of carbonaceous matter in the cylinders. On the other hand, a properly refined mineral oil will distil away leaving little or no residue.—Yours truly,

A. DUCKHAM.

A MELBOURNE correspondent asks for the name and address of the La Forina motor-tyre covers.

THE BARDON CARS.—"Herring" writes:—"Can any of your readers tell us where it is possible for us to obtain spare parts for Bardon motor-cars in this country?"

AUTOMATICALLY REGULATED IGNITION.—"J. R. C." writes:—"I should be glad if any user of an Albion or Brotherhood car would inform me if the automatically advanced and retarded ignition with which these vehicles are fitted give satisfactory results in practice."

DIRT IN PETROL.—In connection with the recent letters on the subject of dirt in petrol which have appeared in the correspondence columns of the *M.C.J.*, the E. M. Bowden's Patents Syndicate, Ltd., write:—"No matter what filtering precautions are taken, a certain amount of foreign matter inevitably does contrive to find its way through, and gives rise to troubles such as your correspondent describes. Convinced of the necessity of re-straining the petrol after leaving the tank, we some time since introduced the Bowden petrol strainer for this purpose—an inexpensive but thoroughly efficient contrivance, which we feel sure will obviate any difficulties with dirty petrol."

## THE MOTOR UNION.

## MEET AT SCARBOROUGH.

ON Saturday the last of this year's provincial meets of the Motor Union was held at Scarborough, an invitation to visit that town having been sent by the Corporation and the North Yorkshire Automobile Club. Not only was an official civic welcome arranged in the Council Chamber, but the Earl and Countess of Londesborough again showed their interest in the motorists by arranging for a garden party at Londesborough Lodge, and although the Earl and Countess were unable to be present, the visitors were welcomed on their behalf by the Mayor and Mayoress of Scarborough (Alderman and Mrs. W. H. Fowler), amongst those present being the Hon. A. Stanley, M.P., Earl Russell, Messrs. A. Duckam, A. A. Dale, Bristol and Gloucestershire A.C.; H. A. Watson and F. Ware, North Yorkshire A.C.; C. MacWhirter, Herts County A.C.; J. Barber and F. B. Cawood, Sheffield District A.C.; A. McAlpin and R. Sutton-Clifford, jun., Leicestershire A.C.; J. Thompson Willows, South Wales and Monmouth A.C.; J. Horace Reeves, Kensington A.C.; E. W. Pennell, E. Newsum, Captain J. A. Ford, and Dr. Godfrey Lowe, Lincolnshire A.C.; A. Barlow, Nottinghamshire A.C.; J. A. Morris, Fred Smith, and D. Adamson-Parkin, Manchester A.C.; T. Clayton, Midland A.C.; Major C. B. Levita, North Eastern A.A.; T. E. King, Harrogate and District A.C.; Dr. J. Hopkins Walters, Berkshire A.C.; A. M. Singer, Sussex County A.C.; Granville M. Kenyon, Kent A.C.; Dr. E. L. Lowe, Ipswich and East Suffolk A.C.; E. Shrapnel Smith, Motor Van, Wagon, and Omnibus Users' Association; G. T. Langridge, Epsom; J. Sutcliffe Pyman; R. W. A. Brewer, London; Dr. J. L. Lock, Uxbridge; C. A. Elgood, London; G. H. Lindsey-Renton, Croydon; W. B. Jessopp, Bedford; C. H. Dodd, Maidenhead; Captain W. E. D. Owen, Sonning; and Mr. Rees Jeffreys (secretary of the Union).

The Mayor having welcomed the motorists and the Hon. A.

## THE GARDEN PARTY.

Members of the Motor Union then attended with their cars on St. Nicholas Cliff and proceeded in procession to Londesborough Lodge, where the garden party was being given by Lord and Lady Londesborough. About fifty cars took part in the procession, and others proceeded to Londesborough Lodge later in the afternoon. On arrival at the Lodge the cars were ranged in rows and were open to inspection, many hundreds of people visiting the "show" of what was certainly a unique collection of up-to-date cars so far as Scarborough is concerned. It was a matter for regret on the part of all concerned that the Earl and Countess of Londesborough were unavoidably prevented from being able to welcome their guests at the garden party which they were pleased to give at Londesborough Lodge, but at their request the Mayor and Mayoress (Alderman and Mrs. Hastings Fowler) readily agreed to receive the visitors on their behalf. The garden party proved to be a most interesting function, and from four o'clock to 5.30 the grounds of Londesborough Lodge presented a very animated appearance. A large marquee had been erected on the lawn, and was furnished principally as a drawing room, a refreshment buffet being provided at the end. The Mayor and Mayoress were engaged receiving guests up to five o'clock, and there were about 200 people present. The visitors thoroughly enjoyed a stroll through the charming grounds, which command a delightful view of the South Bay and coast scenery. Lord Londesborough, although obliged to leave Scarborough, sent the following message of regret to the Mayor:—"Please convey to the Automobile Club my best wishes for a pleasant afternoon, and my regret at not being present.—Londesborough, Blankney."

## THE DINNER.

A dinner was held at night at the Grand Hotel, and was attended by about 170 ladies and gentlemen. Lord Wenlock, K.C.B., president of the North Yorkshire Club, took the chair, being supported by the Hon. Arthur Stanley, M.P., Alderman Hastings Fowler, J.P., Mr.

The Provence Speed Trials.—Aubert starting on a Mieuisset Car. (See page 640.)

Stanley having thanked the Corporation, the General Committee proceeded to business.

## MEETING OF THE COMMITTEE.

The Legal Cases Committee reported that they had dealt with 102 applications for legal advice or financial report from members of the Union, and grants aggregating to £120 had been made towards the legal expenses of members. The question of entering into an agreement with the Society of Motor Manufacturers and Traders was considered, and it was resolved not to enter into such an agreement, as it might, in the views of some members, prevent an absolute freedom of action which enabled the Motor Union to protect and safeguard the interests of all its members. It was resolved to prepare and circulate the standard agreement for the purchase of a motor-car for the guidance and use of members. The Highways Protection Committee of the Union reported that the Union had instituted successful prosecutions in four cases of obstruction, one at Canterbury, by the driver of a horse and trap; another at Maidenhead, by the driver of a brake; a third at Ongar, by the driver of a brake; and a fourth, which included a conviction for assault, at Ashford, Kent. It was reported that six newly-formed clubs had joined the Union, namely, Blackpool A.C., Cambridgeshire A.C., New Forest and Bournemouth A.C., Shropshire A.C., Crystal Palace A.C., and the Naval Motor Club. The total number of clubs is now sixty-three, and the aggregate membership 13,500. The Union is thus the largest motoring organisation in the world.

Amongst the other business dealt with by the Committee was the question of the large increase in the price of petrol, and a strong committee was appointed to consider the question of motor-car fuels and to report. Among the suggestions made for the consideration of this sub-committee is that the Union should offer special prizes for the design of an efficient paraffin carburettor, or should enter into long period contracts with the firms supplying petrol as to the price at which this commodity should be furnished to their members.

Walter Rea, M.P., Mr. H. A. Watson, chairman of the North Yorkshire Automobile Club; Mr. Langridge, vice-chairman of the Motor Union; Mr. A. W. Bosville, J.P., D.L., vice-president of the Yorkshire A.C.; Mr. R. C. Blaylock, agent for Lord Londesborough; Mr. Edwin Gray, York; Captain Cole, chairman of the Lincolnshire A.C.; Major Bower, Chief Constable of the North Riding; Mr. W. Basham, Chief Constable of Scarborough; Mr. Rees Jeffreys, secretary of the Motor Union; and other prominent motorists.

After the loyal toasts Lord Wenlock gave the toast of "The Motor Union of Great Britain and Ireland." It was felt by all motorists that it was necessary that they should have at their head an organisation capable of looking after the individual members of the body, and standing up for those privileges and legal rights to which they were entitled, and to show to the world at large that it was a body that was determined, as far as it possibly could, to protect the interests of its own members and of those who were associated with it. Those who used motor-cars were well aware that they were exposed to a certain amount of unpopularity, criticism, and hostility, and he was afraid that in some cases this attitude was almost justified by the conduct of those who drove motor-cars. He was glad to think that that organisation had been started to put an end to the disagreeable parts of motoring, and to produce as far as it possibly could in all the members of the Union that proper and due consideration of the welfare and interests of others which could only be found in a well-organised and duly constituted body. It was not the motorists only who sometimes disregarded the rules of the road. It was not unusual to meet a lazy carter on the wrong side of the road, and himself fast asleep. One thing he had observed with satisfaction was that, motoring as he did mostly in country roads, the horses of the country were very much more accustomed to motors than they were two or three years ago, and he noticed that the nervousness that was exhibited on these occasions was much more violent in the human being than in the equine.

The Hon. A. Stanley, M.P., in responding, said he was expected to say something on the question of the proposed taxation of motor-cars. He always absolutely and implicitly believed everything he read in newspapers and especially the motor press, but he had been told a something with regard to taxation which he had read with a certain amount of scepticism. Some of the public did not seem to care for motorists, and some of them looked upon taxation from a rather peculiar point of view. They appeared to argue that if they had a particular dislike to anything, all they had to do was to put up the taxes and tax it out of existence. That was a delightful view, and he was sure they would all wish to be Chancellor of the Exchequer for one glorious year if they could tax out of existence any thing that they objected to. What motorists had got to do, whenever the crisis arrived, was to put their case squarely and forcibly, but with moderation, before the Government and the country, and if he might venture on a humble word of advice, especially to the motor press, the most certain way of bringing the evils upon them was to announce broadcast that those evils were going to come.

The toast of "The North Yorkshire Automobile Club" was proposed by Captain J. A. Cole, the Chairman of the Lincolnshire Automobile Club, who congratulated the club on the work it had done. Mr. H. A. Watson, Chairman of the North Yorkshire Automobile Club, and general superintendent of the North Eastern Railway Company's traffic department, replied. Local toasts followed, the speakers being Mr. W. R. Rea, M.P., Mr. G. T. Langridge (Epsom), and the Mayor, after which Mr. A. W. Macdonald Bosville proposed the toast of "The Chairman," whose reply concluded the proceedings.

second in 5 h. 51 min. 26 sec.; and Harding (Haynes), third, in 6 h. 25 min. 39 sec.

At this point the crowd broke on to the course and the race was stopped, although five competitors were still on the road, viz.:—Lytle (Pope), Christie (Christie), Frayer and Belden on Frayer-Millers, and Roberts (Thomas); the first two of these being selected by the jury to complete the team of five cars to represent America in the international event.

### PUBLIC MOTOR SERVICES.

A NEW service of the "Pioneer" motor-omnibuses has started from the Monster, Pimlico, to Liverpool Street, E.C. There will be an early workmen's service and a very late service from Pimlico to Cricklewood.

THE motor-bus services from Leyton and Upton Park to the City have proved so popular that the residents of Manor Park and Forest Gate are anxiously awaiting developments in their direction.

SEVERAL motor-bus drivers have been summoned by the police at Westminster for exceeding the speed limit in Brompton Road, S.W. The vehicles travelled from fifteen to seventeen miles an hour. Several of the men urged that they had nothing to indicate the speed at which they were going, but the magistrate failed to see that this was a matter for him.

SOME reflections are caused by an accident in Regent Street, London, the other day, when a cabman was fatally injured by a motor-bus. There seems to have been plenty of room for the clearance of the vehicles, but the two drivers, according to the verdict of the coroner's jury, "both

Caillois at the wheel of the 115-h.p. Thomas Car he drove in the Eliminating Contest for the American Vanderbilt Cup Team on Saturday last.

### THE VANDERBILT CUP RACE.

THE eliminating contest for the American team for the Vanderbilt Cup Race, which is to be held on October 6th, took place on Long Island on Saturday last. The course measures exactly 2.71 miles, and as this had to be covered ten times, the total distance was 27.1 miles as against 283.2 miles in 1905. Fifteen entries had been received, and of these thirteen started, the order in which they were dispatched being as follows:—

No.	Car.	Driver.	No.	Car.	Driver.
1.	80-h.p. Oldsmobile	Keeler	8.	110-h.p. Christie	Christie
2.	120-h.p. Pope	Lytle	9.	110-h.p. Frayer-Miller	Lowell
3.	80-h.p. Matheson	Mongini	10.	50-h.p. Haynes	Harding
4.	115-h.p. Thomas	Caillois	11.	85-h.p. B. L. M.	Dolneau
5.	115-h.p. Thomas	Le Blon	12.	110-h.p. Frayer-Miller	Belden
6.	115-h.p. Thomas	Roberts	13.	90-h.p. Locomobile	Tracy
7.	110-h.p. Frayer-Miller	Frayer			

The sorting-out process quickly commenced. Caillois (Thomas) fell out in the first round owing to engine troubles, as also did Keeler (Oldsmobile), a skid at one of the bad turns breaking a road wheel. The Matheson car was also put *hors de combat*; one of the tyres burst, and the car, swerving, struck a telegraph pole. Mongini and his mechanic were thrown out, but neither of them was seriously injured.

For a long time Le Blon (Thomas), held the lead, but Tracy (Locomobile), slowly crept in front and finished first in 5 h. 27 min. 45 sec., or an average of about fifty-five miles per hour. Le Blon (Thomas), was

expected the other to give way." "In the circumstances," added the jury, "it was the duty of the motor-omnibus driver to pull up." The drivers of such vehicles should remember the power of the engines of which they have charge, as well as the weight of these buses. The fact that they have such an infinite power for mischief if not properly controlled should lead to great care being taken in driving.

SEVERAL new motor-buses have been put in public service in the Bromley (Kent) district.

THE holiday season being over, several of the motor vehicles which the G.E.R. have had in service on the east coast are returning to town.

AT the meeting of the Levenshulme District Council on Monday, Mr. Samuel Whittall (chairman) presiding, the resolution of the Highways Committee to discontinue the licences granted to the Manchester Motor Omnibus Company, Ltd., was confirmed. The Committee reported that this action had been taken owing to a petition of the residents in Slade Lane and Albert Road.

### THE CANNING CUP.

MESSRS. R. E. PRICE, holder, W. Jacques, and C. C. Murphy left Inchicore Bridge on Saturday for a race to Carlow in connection with the above contest. The journey was accomplished in due time, leaving W. Jacques to add his name to the cup by doing a non-stop run, both the other competitors having had one stop each. Price and Jacques have now one share each in the trophy, which must be won twice in succession in one season, or four times in all, before becoming the property of the holder.

## CLUBS AND ASSOCIATIONS.

### AUTOMOBILE ASSOCIATION.

IN order to cope with the increased motor traffic during and after the Tourist Trophy Race in the Isle of Man, the Automobile Association have extended their organisation of confidential agents along the London-Liverpool road as follows:—Barnet, St. Albans, Dunstable, Fenny Stratford, Stony Stratford, Towcester, Daventry, Dunchurch, Coventry, Tamworth, Lichfield, Rugeley, Stone, Nantwich, Tarporley, Chester, Birkenhead.

An alternative route for the return journey has been arranged from Liverpool via Warrington, Knutsford, Northwich, Newcastle-under-Lyme, Stone, &c

### RICHMOND MOTOR CYCLE.

ALTHOUGH the Richmond and District Motor Cycle Club has only been in existence a few weeks, it has already more than thirty members. Membership is only open to amateurs, and the Marquis de Mousilly de St. Mars is president. The entrance fee is 2s. 6d., whilst the annual subscription is 7s. 6d. for both car owners and motor-cyclists. One advantage of membership is the insurance of cars or cycles at ten per cent.

A 12-15-h.p. Arrol-Johnston Shooting Car, with a natural wood body by Reid's Perth Carriage and Motor Works, built for Mr. James Head, of London. The inside seats are made to fold down for the accommodation of luggage in connection with deer-shooting. De Nevers tyres are fitted to the hind wheels and Continentals to the front ones.

discount from the ordinary premiums. The hon. secretary is Captain L. L'Estrange, the Automobile Club, Piccadilly, W., and the captain is Mr. W. M. Paul, M.D., 1, Brunswick Road, Kingston Hill.

### LADIES.

LADY SALOMONS, a member of the Committee of the Ladies' Automobile Club of Great Britain and Ireland, has invited her fellow members to hold their last automobile meet of the year at Broomhill, Tunbridge Wells, on Thursday next.

The route advised by Lady Salomons is:—Westminster Bridge, London Road, New Kent Road, Old Kent Road, Lewisham High Road, Bromley, Sevenoaks, Tonbridge, Southborough. Just beyond the last house in Southborough (right hand side) there is a sign post which reads "To Broomhill."

### DERBY.

TO-DAY (Saturday) the closing run of a very successful season in connection with the Derby and District Automobile Club will take place to Dovedale, and a very large gathering of members and friends is expected. The meeting place is at the Peveril Hotel, where ample accommodation will be found and tea will be obtainable from 4.30 to 5.30.

This enterprising club now ranks sixth on the list of purely provincial clubs, and is one of the most successful and strongest numerically and financially.

### WEST SURREY.

A PETROL consumption trial was held on Saturday, over a course of 22½ miles along the Petworth road, the start being made from the Chairman's residence at Shackelford.

Of the fourteen cars entered, all completed the trial, Mr. Tessier's 12-h.p. De Dion proving the winner on the formula:—

Total weight.

Petrol consumed.

The results were as follows:—

Car.	Petrol used. oz.	Oz. per 1,000 lbs weight.
A. C. Tessier ... 12-h.p. De Dion ...	96 ...	37
Dr. Minchin ... 8-h.p. De Dion ...	73 ...	39
R. S. Robertson ... 6-h.p. Wolseley ...	77 ...	44
E. E. Pullman ... 15-h.p. Durkopp ...	162 ...	48
Miss Houghton ... 14-h.p. Renault ...	156 ...	50
L. Pullman ... 16-h.p. Aries ...	156 ...	51
G. M. Ledebor ... 12-h.p. Humber ...	166 ...	58
R. Crothers ... 9-h.p. Darracq ...	117 ...	64
Col. Swaine ... 9-h.p. Cadillac ...	142 ...	69
Col. Fairtlough ... 12 h.p. Darracq ...	147 ...	69
R. W. Buttemer ... 14-h.p. Renault ...	220 ...	70
F. W. Swinscow ... 8-h.p. De Dion ...	128 ...	73
J. W. Ponsford ... 8 h.p. Clement ...	158 ...	77
Dr. Fennings ... 12-h.p. Argyll ...	224 ...	77

Mr. C. W. Crawley acted as judge and took charge of the measuring operations, while Mr. H. Burke took the "control" at North Chapel, and at the conclusion of the proceedings those present were entertained to tea by Col. Fairtlough, chairman of the club.

### MOTOR-CYCLE UNION OF IRELAND.

ON Saturday, before a fair attendance, the Ulster centre of the Motor-Cycle Union of Ireland brought the season to a close. The scene of action was Gilnahirk, where a hill-climbing contest was held, the event being divided into two classes, one for cars and one for cycles, both being decided on a handicap. Seven took part in the class confined to cars, and twelve in the other, with the following result:—

CLASS A.—CARS.		Handicap.		Time.	
Name.	Car.	sec.	M. sec.	M. sec.	M. sec.
1. T. H. Dunlop ...	5-h.p. Peugeot ...	36 ...	3 20	2 44	
2. J. S. Garrett ...	8-h.p. Rover ...	9 ...	3 18	3 9	
3. J. Holden ...	6-h.p. Rover ...	22 ...	3 54	2 53	122-5

Also competed: J. Hurst, 10-h.p. Phoenix (scratch), J. N. McCommond, 10-h.p. Darracq (7 sec.), R. Dunlop, 10-12-h.p. Coventry Humber (18 sec.), J. B. Ferguson, 5-h.p. Peugeot (39 sec.)

CLASS B.—CYCLES.		Handicap.		Time.	
Name.	Car.	Sec.	M. sec.	M. sec.	M. sec.
1. H. G. Ferguson ...	3½-h.p. Minerva ...	6 2-5 ...	1 22-5	56 2-5	
2. R. W. Ireton ...	3½-h.p. Riley ...	4 ...	1 03-5	56 3-5	
3. A. F. Craig ...	2½-h.p. Minerva ...	12 ...	1 10 3-5	58 3-5	
4. C. A. Rea ...	3½-h.p. Enfield ...	11 4-5 ...	1 16 4-5	1 32-5	
5. J. G. Veighey ...	3-h.p. Triumph ...	12 ...	1 19 4-5	1 7 4-5	
6. W. B. Reid ...	2½-h.p. Minerva ...	13 4-5 ...	1 22	1 81-5	
7. A. Bullock ...	3½-h.p. J.A.P. ...	11 ...	1 21	1 10	
9. J. Stewart ...	3½-h.p. Brown ...	6 3-5 ...	1 16 4-5	1 101-5	
9. J. McNeill ...	3½-h.p. N.S.U. ...	11 4-5 ...	1 37	1 25 1-5	

Also competed, J. S. Garrett, 5-h.p. Rex (scratch), J. H. Jordan, 3½-h.p. Bat (5 sec.), A. W. Hamilton, 3½-h.p. Ormonde (6½ sec.)

THE MANX Automobile Club had a meet at the Point of Ayre on Thursday of last week.

MR. G. J. WILKINSON, 18, York Avenue, Lincoln, is the hon. sec. of the new motor cycle club for Lincolnshire, which will hold its first general meeting at the Spread Eagle Hotel, Lincoln, on the 3rd prox.

MR. FRANK BOLTON, in addition to making the fastest time on his 35-h.p. Daimler on Saturday last, at the Mid-Staffordshire Automobile Club's hill climb, also secured first prize on the handicap as calculated by the A.C.G.B.I. formula. Originally the award was made to another car, but since then a mistake has been discovered and the prize given to Mr. Bolton's 35-h.p. Daimler.

### ROAD REPORTS.

SOUTHAMPTON.—Complaints have lately been rife as to the wilful way in which drivers of carts and wagons ignore the rule of the road without incurring the displeasure of the police. Local motorists would do well to call the attention of the authorities to the matter.

ISLEWORTH.—At their last meeting the district council decided to postpone the completion of the wood-paving for about a mile and a half of the main road between Brentford and Hounslow. This action was due to the fact that the Middlesex County Council would only agree to defray the cost of the work (£18,000) by means of annual instalments of principal and interest on the loan.

PUTNEY.—Local suggestions are being made in favour of the foot of the hill being scheduled as a dangerous point, and motorists warned accordingly.

## THE HEATING OF MOTOR-CARS IN WINTER.

A MOTOR-CAR, on account of its relative high rate of speed, as compared with other road conveyances, is a very cold vehicle for winter use, and when it is considered that at all times during its operation it is giving off large amounts of waste heat, it is rather surprising that so little use is made of this otherwise useless "caloric" to heat the vehicle and thus render its employment more comfortable during the cold season which is now rapidly approaching. Either the circulating water or the exhaust gases may be employed for heating purposes. Some closed vehicles have been warmed by coils, through which the engine cooling water is caused to circulate, and this method works well, if properly installed, although the full heating effect is not realised until the motor has been run for a certain length of time. It is, however, not generally advisable to attempt to apply an arrangement of hot water coils to an ordinary car, as the cooling system may be deranged by its addition, expense is involved, and the possible chances for water leaks are increased.

On the other hand, the exhaust possesses its full temperature as soon as the motor is started; it may be drawn upon to any extent without affecting the operation of the motor, no possibility of annoyingly leaky connections is involved, and the arrangement for utilising it is simple and cheap. For use on ordinary cars, two foot warmers, set one into the floor board of the front seat and the other into the flooring of the rear portion, will be found effective. The warmers should consist of thin, flat, rectangular chambers of strong sheet iron, in shape like shallow closed boxes. At the upper corners they should be provided with angular lugs, riveted on, adapted to rest upon and be fastened to some part of the car frame or floor, and hold the upper surface of the heater flush with the level of the rest of the footboard.

The seams of the sheet iron of the heater should be brazed, and several bolts should hold together the flat top and bottom. It should be covered with several layers of asbestos paper, well banded into place. Such a heater need not be more than 2½ or 3 inches in depth, and may be of any convenient horizontal length and breadth. On some cars, owing to the presence of interfering portions of the mechanism, it may not be easy to find a place for it in the front footboard, but usually room may be found in the section of flooring next to the heelboard, which may be removed or cut away to give space for it. Ordinarily, there will be no difficulty in applying a heater of this sort to the back part of the car. A mat of some rather thin material, not too much affected by heat, may cover the flush upper surface of the heater and the remaining floor boards.

As regards the pipe connections, on one end of the heater—which ever happens to be most convenient—should be a fitting arranged to take a small pipe leading from the silencer or exhaust pipe. This pipe should contain a union, which may readily be broken, and allow of the easy removal of the heater when desired. This should be provided for with special care in case the presence of the heater prevents access to any important portion of the car mechanism. In this supply pipe, preferably close to its entrance to the heater, should be located a valve capable of withstanding the heat of the gases. There should also be inserted in this pipe a fitting containing a fine metal gauze screen to prevent the communication of flame to the heater and the explosion of any unburnt gases which may have entered it. If desired, a spring check valve opening toward the heater may also be located in the supply pipe.

To enable the heat to be regulated, a number of very small holes should be drilled at the opposite end of the heater from that at which the supply pipe enters, the number and size of the holes being best determined by experiment. Through these fine holes the gases gradually escape, and a current of hot gas is constantly passing slowly through the heater, maintaining it at a suitable temperature. By means of the shut-off valve the entering gas may be throttled to any desired extent, and the temperature of the apparatus thus controlled in a measure. The supply pipe for the heater may be tapped from the exhaust pipe preferably close to the silencer, or, if more convenient, it may be connected to the exhaust box itself, the connection being made at such a point that the proper pressure may be obtained. When not required the supply of gas to the heater may be entirely shut off by the valve, and during the warm months the whole arrangement may be removed and a plug screwed into the exhaust pipe or silencer casing where the supply pipe was connected. The use of such foot warmers adds very greatly to the comfort of winter driving, and their installation does not involve a large expense. When once properly arranged they should not give any trouble for a long time.

## POLICE TRAPS.

IN view of the fact that the Bridge (Dover) Parish Council intends to call the attention of the Chief Constable to the speed of motor-cars passing through the village, traps may be expected there ere long.

IN the parish of Scagglethorpe, on the Malton and Scarborough main road, is a well-laid police trap, wherein five motorists have just been caught.

SUPERINTENDENT LAKIN, of Bakewell, has told the Bench that there are no police "traps" in his district. They apparently rely on the constables' "estimates of speed."

MOTORISTS should take particular care when in the neighbourhood of the Whinney More cross roads, near Retford.

## THE AUTO CYCLE CLUB'S MEET.

AWAY in Canning Town, on a track fortunately accessible by means of the District Railway's station at West Ham, the Auto Cycle Club held its annual race meeting on Saturday. The afternoon was dull, and even the band of the 4th Vol. Battn. Essex Regiment, which discoursed music, was scarcely as enlivening as usual. About 1,500 spectators watched the proceedings, and a goodly company of officials seconded Mr. F. Straight in the organisation of the meet, which demonstrated the secretary's capacity in that direction. The judges were Capt. L'Estrange and Mr. H. P. E. Harding, with Mr. A. G. Reynolds as technical judge and Mr. T. E. Dutton as timekeeper. Mr. F. Jenny acted as starter.

The one mile flying start time trial for the "Automotor" challenge cup was won by C. R. Collier in good time; in fact, the times of the three placed riders were all within those of last year's winner, which was 1 min. 11 sec. In the hour scratch race a mild sensation was provided by the mishaps which unfortunately befel E. Varney, whose machine caught fire after he had led for a couple of miles. After a brief delay he restarted and was riding well when his machine went wrong and he dismounted. When about to remount the petrol again caught fire, and with flames leaping up into the air the cycle was dragged along the cinder track by its front wheel, but not until the petrol was consumed could the fire be put out. The rear tyre was quite destroyed and all chance of continuing in the race was at an end. The five miles tourist handicap was a good race, but D. R. Clarke had a somewhat easy win in the five miles open motor-bicycle handicap for the MOTOR-CAR JOURNAL Challenge Cup. Below are the results of the various events:—

One Mile Flying Start Time Trial for "Automotor" Challenge Cup. Holder, H. V. Colver, time, 1 min. 11 sec.—C. R. Collier, Matchless,

Mr. and Mrs. Stewart, of Poona, India, on their 20-22-h.p. Brown Car. Mr. Stewart, who has recently returned home after a tour in this country, has covered about 2,500 miles on his vehicle without a single "alip" of any kind, and is very pleased with its performance.

J.A.P., 1 min. 53-5 sec., 1; E. Varney, Crownfield, Givandan, 1 min. 8-5 sec., 2; D. R. Clarke, New Century, Givandan, 1 min. 9-1-5 sec., 3.

One Hour Scratch Race for "Motor-Cycle" Challenge Cup. Holder, Rene Thomas, 45 miles 146 yds.—C. R. Collier, Matchless, J.A.P., 43 miles 1,280 yds., 1; H. V. Colver, Matchless, De Dion, 36 miles 1,360 yds., 2; H. Goodwin, Crownfield, Givandan, 31 miles, 3. Collier led from the twelfth mile to the finish, Colver being in front from the sixth to the twelfth, after Varney lost the lead he held from the start to the sixth mile.

Five Miles Tourist Handicap.—L. A. Baddeley, Baddeley, 2½-h.p. N.S.U., 30 sec. start, 1; F. W. Applebee, Rex, 45 sec., 2; H. Jackson, Riley, 3-h.p. Riley, 25 sec., 3. Won by three lengths; third man half a lap behind. Time, 6 min. 41 sec.

Five Mile Motor Bicycle Handicap (open) (for the MOTOR-CAR JOURNAL Challenge Cup. Holder, W. Hodgkinson).—Heat 1: H. V. Colver, De Dion, 10 sec. start, 1; A. Edmondson, Minerva, 20 sec., 2. Time, 6 min. 5-4-5 sec. Heat 2: C. R. Collier, J.A.P., scratch, 1; E. Varney, 5 sec. start, 2. Time, 5 min. 55 sec. Heat 3: D. R. Clarke, Givandan, 30 sec. start, 1; W. Hodgkinson, J.A.P., 5 sec., 2. ITALA EXPORTATION COMPANY, LTD.—Capital, £20,000. To acquire the right to sell Itala cars in North America, and to carry on the business of motor-car manufacturers and dealers, garage keepers, &c. Registered office: 89, Wigmore Street, W.

## CROSSING A FOOTPATH.

THREE motor drivers in the employ of Messrs. Jackson Bros., Blackpool, were summoned in eight instances on Monday for driving across the footpath to a piece of land fronting Waterloo Road and the Promenade at South Shore. The cases were taken under one of the Local Improvement Acts. Mr. Callis, who prosecuted on behalf of the police, stated that the reason the cases had been brought was that wherever there was a piece of vacant land on the Promenade surrounded by footpaths the proprietors seemed to jump at the offers of motor garage people to create these vacant places into open-air garages, and if not stopped every piece of land might in time be turned into a garage. The evidence showed that the defendants in plying for hire had used the land for loading and unloading purposes, and in order to get to it they had had to cross the footpath.

Mr. Fletcher, for the defence, said it was perfectly clear that there was neither danger nor obstruction nor complaint in regard to the use of the land, and the question raised by the prosecution was, were they by the enforcement of that section to be prevented the perfectly reasonable use of the land for the purpose of trade? If the magistrates were going to take the literal meaning of the section it would mean that absolutely nothing on wheels could be taken across any footpath.

After hearing the evidence the magistrates fined the defendants 20s. and costs in each case. Mr. Fletcher asked the Bench to state a case.

## CASES AGAINST MOTORISTS.

AT the Harrogate Borough Police Court a London chauffeur named Nurse has been charged with driving a motor-car to the danger of the public in Skipton Road, Harrogate, on September 6th, and also with being drunk while in charge of the car. The defendant was fined £1 and costs for being drunk and £10 and costs for driving recklessly.

HORATIO POORE, a driver employed by the London General Omnibus Company, was fined 20s. at Mortlake, for driving a motor-bus in Castlenau and Church Road, Barnes, at fifteen miles an hour. Inspector Sterry said he had received numerous complaints from residents of the noise from these motor-buses as they returned to the Mortlake garage during the early hours of the morning.

AT Godmanchester (Hunts) Louis Soncin, chauffeur to the Maharaja Tikari, an Indian prince who took part in the Skegness motor races, was fined £10 and costs for driving a motor-car to the common danger at Godmanchester.

A MOTOR-CAR driver named Stanley S. Rogers, of Hale, Cheshire, was charged at the Llandudno Police Court with driving a motor-car to the danger of the public. Evidence was given that the defendant approached on his right side of the road the cab rank at the corner of Lloyd Street, and then suddenly swerved to the right side of the cab rank, passing close under the nose of the nearest horse, and going by the line of vehicles on the wrong side of the road. The chairman (Mr. Kneeshaw) said the Bench thought that drivers of these cars ought to know the rule of the road, and also have some idea how to conduct themselves. A fine of 40s. and costs, including advocate's fee, was imposed, the total being £4 5s.

CHARLES O'NEIL, a chauffeur, of Cornwall Terrace Mews, Regent's Park, answered summonses at the Marylebone Police Court for failing to sound a bell or horn on the approach of his motor-car when necessary, and also for driving a motor-car in a manner dangerous to the public. Mr. Arthur F. G. Leveson-Gower said that on July 17 he and his son were on their way to Regent's Park Road. A motor-car suddenly passed close to them at a fast pace and went through the gate. The driver of the car did not give any signal of his approach. Mr. Paul Taylor said he was satisfied with Mr. Leveson-Gower's evidence and fined the defendant 10s., with 2s. costs, on the first summons. The second summons he dismissed with 2s. costs.

HENRY BLACKBURN, who was summoned at West London on Monday for driving a motor-car in a dangerous manner in Holland Park Avenue, Kensington, had told the police that he was on his way to call for his mistress, Miss Edna May, at the theatre, and was in a hurry. The defendant was fined £10, or one month's hard labour.

FOR driving through the market-place of Boston (Lincs.) a motor-cyclist of West Ham has been fined 40s. with 39s. 6d. costs.

AT Snaith, on Friday, the 21st, the magistrates were three hours listening to offences alleged to have been committed by motorists on different dates on the road at Eggborough, midway between Doncaster and Selby. There were twenty defendants, and, with the exception of two cases which were adjourned to the next Court, all were fined, the total amount being £67. Among the defendants was Sir. Jas. Duke, Bart., whose car, it was stated, travelled at the rate of twenty-six miles an hour on August 20th. He was fined £7. Fines of £6, £5, and £2 were imposed on several defendants, and a fine of £3 on Mr. Joseph Hutton, engineer, of Scarborough. George Wm. Botting, electrical engineer, of Buxton, for riding a motor-cycle at the rate of twenty-seven miles an hour, was fined £2, and 15s. for not possessing a driver's licence.

ON Monday, at Haywards Heath, eight cases of exceeding the legal limit were disposed of, the fines ranging from £3 on Joseph Bandey, of Kentish Town, to £10 in the case of Edmund Dangerfield, of Ealing. On the same day three cases were heard at Arundel and a warrant issued against one defendant who did not appear.

WALTER RUTHERFORD, Ashley Gardens, Victoria Street, London, who had been previously convicted, was, at Oxted on Monday, fined £6 and costs for exceeding the speed limit. Defendant admitted by letter that he travelled at thirty miles an hour at Lagham Cross-roads, Godstone, which was described as a very dangerous corner.

THE magistrates at Norman Cross were occupied most of Tuesday dealing with motor-car cases, and many sharp passages took place. In one case the police failed to establish the identity of the defendant, Sidney George Barnes, chauffeur, of Kensington Court, Kensington, who was charged with driving to the public danger at Stilton. Arising out of the case a London solicitor, whose address did not transpire, was summoned, as owner of the car, for withholding information which would lead to the identification of the driver, and was fined £20 and costs, £1 10s. 2d. Notice of appeal was given. Fines amounting to £31 were imposed in six other cases.

## OBSTRUCTING MOTORISTS.

FOR obstructing a motor-cyclist on the Great North Road, Finchley, Stephen Albert Graddage, landlord of the Wellington, Archway Road, has been fined 10s. and costs at Highgate. Mr. Harold Walford, of Finchley Road, Hampstead, stated that while he was riding a motor-cycle the defendant drove a pony and trap on the tramway lines and refused, for about 200 yards, to draw to the near side to let him pass, although he sounded his "hooter" several times. Sir Alfred Reynolds, in convicting, remarked that everyone did not love the motor-cyclist, but it must be recognised that he had every right to be on the road.

A COVEY of pheasants rushed across Leigh Road, Worsley, Manchester, right in front of a motor-car, on Sunday. The driver, in pulling to one side to avoid the birds, pulled the car over, and he and two passengers were thrown out. Fortunately they escaped with only slight injury.

## MOTOR-CAR ACCIDENTS.

AN extraordinary motor-car accident has occurred near the Shropshire village of Watersupton, four miles from Wellington. A car containing five persons, with the chauffeur, was travelling from Keele Hall, Staffordshire, the residence of the Grand Duke Michael, to Watersupton. When within a quarter of a mile of the latter place, and in descending a hill, the car skidded a few yards from the narrow bridge spanning the river Tern. It came into contact with the parapet of the bridge, which was knocked off, the occupants of the vehicle being thrown out.

AFTER several adjournments, the inquest on John King, who was killed in a motor accident at Leeds on August 17th, has been concluded. He was riding in a motor-car, which was on a trial run, when it collided with a cart and the occupants were thrown out. Mr. T. M. Atkinson, the driver of the car, denied that his speed was more than fifteen miles an hour. The jury found that the car was travelling at too great a speed, but that the driver's culpability was not such as to warrant a verdict of "Manslaughter." The coroner pointed out that this was equivalent to a verdict of "Accidental death."

"THE automobile catastrophe," as it is called, is the novelty of the year at the sixth annual toy show which was opened in Paris last week. Wound up by clockwork, it starts slowly, then increases its speed, and suddenly breaks up into four pieces, and little travellers are thrown out. The machine can be quickly put together again and is then ready for another catastrophe.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

## COMMENTS.

**I**MPORTANT, though somewhat informal, has been the recent meeting of representatives of the Motor Yacht Club with the maritime section of the Legion of Frontiersmen. It was intended to discuss the possibilities of the co-operation of the two bodies with a view to the organisation of a motor-boat force that should act with the Admiralty in a way similar to the assistance rendered by the Motor Volunteers to the Army. At the present time we do not think there are sufficient motor-boats owned by British motorists which would be of the real assistance required by the naval authorities, and it behoves the latter to indicate to organisations like the Motor Yacht Club and the British Motor Boat Club the class of boat they desire. Further meetings are to be held of those interested in the matter, and, doubtless, some scheme will ultimately be evolved, but there must be no attempt to unduly hasten matters before the design of the boats is satisfactorily settled.

### Kingston Again.

THE warning given last week with regard to motoring in the vicinity of Kingston came not a day too soon. There has just been another batch of victims of traps on the Portsmouth road hauled before the Kingston Bench, and convictions were obtained in nine out of eleven cases, two being dismissed with the motorists given the "benefit of the doubt." In accordance with the announcement recently made from the Bench, the penalties imposed were increased, ranging from £10 to £3, and costs, two motorists being mulcted of the former sum. Colonel Roupell attended the court and asked the magistrates if it were not possible for something to be done to prevent the excessive speed at which motor-cars travelled over Kingston Hill. The chairman said it was incredible the number of complaints that the justices received with regard to the speed of motor-cars in the district, particularly in Richmond Park. He was afraid the police could do nothing, but he would ask them to look into the matter.

### The King in the Highlands.

THE route selected for the King's recent motor-car journey from Tulchan Lodge to Balmoral proved to be not the direct one by Tomintoul, but a more circuitous one by Dufftown and Cabrach. This road, in its earlier stages, is excellent, but in the upper parts of Aberdeenshire it is difficult, and but little frequented by automobilists. Apparently much still requires to be done before the direct road connecting Deeside with Upper Strathspey will become a popular highway. Were this picturesque region in Norway, it would not long remain without a practicable road, and apparently the coming of the motor-car will hasten the advent of such a highway in many places in northern Britain. Meanwhile there are many people in Scotland keenly solicitous of closing many of the roads altogether to the only form of traffic by which the delights of

the country can be adequately explored, and a long discussion has taken place on the subject at the meeting of the Highland District Committee of the Perth County Council. Many suggestions were made, but when a decision was come to it was found that common-sense was in the ascendant, and that no attempt was to be made to influence the Secretary for Scotland in the direction of closing any more roads to motor-cars within the area of their jurisdiction.

### Blackpool.

BLACKPOOL will be merry next week over the motors, and doubtless the charities of the town will benefit largely. Fortunately the attempt to prevent the meeting has failed, and there is no doubt that the legal decision in the Lancashire Chancery Court at Liverpool on Tuesday is a popular one, not only in the town primarily concerned, but throughout the north of England particularly and the whole of the automobile industry in general. It was sought to show that the assemblage of a great crowd on the promenade would cause an obstruction, that the racing of cars would be a violation of the Motor Car Act, and that the event would prove an inconvenience to the public. Against this was the contention of the Corporation that they had liberty to enclose the promenade if they so desired; that the expenditure on the event might be regarded as an advertisement for the town, and generally that the whole affair was in the interest of Blackpool—a fact that should be apparent to the merest tyro in public affairs. This was the view of the deputy of the Chancellor, who dismissed the motion against the meet, because, in legal parlance, the matter was not one "for interlocutory injunction."

### A Popular Programme.

Now that the legal difficulties have been summarily brushed aside, renewed interest will be found in the programme, the details of which are set forth in the complete analysis on page 668. The committee are evidently determined to make the organisation of the affair a great success. The regulations have been drawn up with the chief object of making motor racing more attractive to the public, and to remove as far as possible the various causes for delays in running the programme up to time. This is a point upon which there has been room for improvement at previous meets elsewhere, and the fact that the committee responsible for the forthcoming races have thus early recognised the necessity of preventing long waits between events is an augury of success, and should assist in attracting a record crowd to Blackpool next week-end.

### Alcohol v. Petrol.

Two years ago the hopes of motorists rose high with regard to the economical provision of alcohol as a fuel for automobiles, and when the Departmental Committee was appointed by Mr. Austen Chamberlain great things were expected. Unfortunately the evidence that was obtained rather upset the calculations of those motorists who had reckoned for great results, and the new regulations which came into force on Monday

last have attracted little attention, save from one or two voices crying in the proverbial wilderness. That there is likely to be an increased production of alcohol for industrial purposes in consequence of the Revenue Act of 1906 is practically certain, but engineers have not moved so fast as legislation in this respect, and some time will elapse ere motorists are able to avail themselves of alcohol for their cars. At the same time it will be noted that the appointment of a sub-committee of the Motor Union to consider the whole question of motor-car fuels, in view of the large increase in the price of petrol, comes at an opportune time, and it is to be hoped that it will not overlook the supply of alcohol at a reduced price. According to the new Act the Revenue will forego 3d. a gallon in the taxation on alcohol for industrial purposes. But it remains to be seen whether full advantage of this reduction will be taken in this country.

#### THE TOURIST TROPHY RACE.

Photos by]

[Mr. Frederic Coleman.

#### The Race an Election Cry.

APPARENTLY there are people in the Isle of Man, as at Blackpool and Brighton, who have little interest in motor races, and while the great contest was in progress last week the election of a member of the House of Keys for Ayre Sheeding took place, Mr. John Clucas being returned unopposed. The principal topic dealt with at the election meetings has been reckless motoring and excessive speed. Mr. Clucas did not know why the island should be singled out as an exhibition ground, and said that the successful racer expected to get £40,000 worth of orders. After the Gordon Bennett race Ireland never asked for them again, and they came to the Isle of Man because

they could get an Act easier than in the British Parliament, which latter statement, we may add, is absolutely true—to the advantage of the Isle of Man.

#### Alternatives to Petrol.

ATTENTION may well be called to the admirable suggestion made by Captain H.P. Deasy in his article on the Tourist Trophy competition on another page. There he advocates that encouragement should be given to the use of other fuel than petrol in the next Tourist Trophy race, and the Motor Union Committee might well give heed to that idea when drawing up their report. Or, in view of Mr. Napier's performance with naphtha at the Glencroe Hill Climb on Saturday, the Scottish Automobile Club might carry forward a series of investigations.

#### Finding the Winners.

A CAR of the type that came second in 1905 in the Tourist Trophy race out-distanced its competitors last week, and thus is industry rewarded. It was unfortunate for the car that probably would have been second that the maxim did not hold true in its case—the record being spoiled by the loss of ballast, and not from any want of merit in the car itself. But motor-car racing has its chances and its risks, and the element of uncertainty enters as largely into the automobile as a means of sport as in any other pastime. This was fully revealed in the interesting competition instituted by the Motor House, of Euston Road, N.W., which offered a prize for an accurate prognostication of the result. Out of the many hundreds who filled in the forms which appeared in the *M.C.J.* on the 22nd ult. there was no single reader who correctly named the three first cars in the exact order of their appearance before the judges' stand. This was one of the remarkable features of a competition which aroused widespread interest. Several competitors expressed a wish to become possessors of the prize before they had won it; one, a county J.P., pointed to his tolerant views and difficulty in walking as a reason for the award of the car to himself, and another entry, enclosing a copy of the "Winning Post," and addressed from a rectory, apologised for not communicating on a *M.C.J.* form. Evidently there are many people wanting small cars, but not one entitled to the vehicle offered by the enterprising Motor House.

#### A Club on the Track of an Offender.

A WEEK or two ago a motor-car ran into a mail-van on the road between Reading and Newbury, resulting in such injuries to one of the horses that the animal had to be killed. The car has so far been unidentified, the driver proceeding without stopping to see what damage he had done. The Berkshire Automobile Club is now offering a reward of £5 for information that will enable them to make an example of such a driver, and have issued a notice to motor repairers and others, offering to anyone who gives information leading to the conviction of the driver of a white, or light-coloured, motor-car, which, at 3.30 on the morning of September 6th, near Thatchem, on the Bath road, collided with and injured one of the mail-van horses. The car was proceeding towards London, and the effect of the collision must have been apparent on the left mudguard. Information may be given to the hon. secretary of the Berks A.C., Beenham Grange, Reading.

#### Technical Instruction.

METROPOLITAN polytechnics, from the East to the West, are going in for motor-car instruction, and the new syllabus of the Regent Street Polytechnic is comprehensive enough to meet the requirements of any intending student of automobilism. This is under the direction of Mr. H. J. Spooner, and both day and evening classes have been

arranged for instruction for motor-car engineers, drivers, and mechanics. Complete courses of driving lessons and instruction in running and workshop repairs have been provided for, and, altogether, this pioneer polytechnic—equipped with Panhard and Darracq cars and Daimler motors—is proving itself well able to compete with the many private schools that have been established. The subject of motor-car engineering has again been included in the syllabus of the City and Guilds of London Institute, which held its first examination in this branch in the summer just ended, Mr. A. A. Sharp, a draughtsman at the G.E.R. works at Stratford, and a student at the Regent Street Polytechnic, winning the silver medal and money prize. At the Institute of the G.E.R., at Stratford, Mr. J. L. Milligan, B.Sc., is conducting the automobile classes, in which students will be prepared for examination. With all this interest being taken in the technical aspects of automobilism, the facilities for obtaining knowledge in London are as widely distributed as anywhere in the kingdom.

direction from automobile organisations have not been well received by the authorities. They can, however, scarcely fail to recognise the need for such warning notices when attention is drawn to the matter by the coroners of the country.

### Crying Wolf.

FAMILIAR enough is the little joke of warning motorists of imaginary police traps, until drivers become somewhat sceptical of their existence and end their journey by running into one. A variation of the idea comes from Essex, where it was stated, at a meeting of the Saffron Walden Rural District Council, that so many motor danger signals had been erected at places where there was really no danger that both motorists and cyclists now paid not the slightest attention to them, and they were consequently useless. Whether this is intended to be used by the advocates for economy as a means of avoiding the erection of more signs we know not; but if the suggestion is

Mr. T. C. Pullinger on the Beeston-Humber at the Bungalow, Snaefell.

### Road Signals.

Now that the coroners have begun to make suggestions to the local authorities with reference to the erection of danger signals at dangerous corners, something really commensurate with the necessities of the situation may be done. At an inquest held at Canterbury on a man who was killed as the result of the motor accident between Bramling and Wingham, it was stated in evidence that the deceased had ample room in which to pass with his vehicle, but the marks on the road showed that he had made a sharp curve to avoid a heap of stones which lay by the side of the road, and then, in making a second turn, the car just caught the off wheel of a builder's van in front and completely overturned. A verdict of "Accidental death" was returned, and the coroner promised to communicate with the authorities in order to have a danger post erected on the top of Bramling Hill, which has at its base a very sharp corner close to the scene of the accident. Elsewhere suggestions in a similar

true the local authority need not worry. It has done its duty, which is more than can be said for many local bodies.

### The Motor Union and Obstruction of Motorists.

ANOTHER lesson has just been taught those who misuse the highway by the Motor Union, which was the prosecutor in a case of obstruction near Byfleet. The case was heard at Chertsey, when Frederick Channell was summoned for obstructing Mr. C. J. Hinsley while driving in his car between Woking and Byfleet. Mr. Granville M. Kenyon prosecuted on behalf of the Motor Union. It was stated that the car, containing Mr. Hinsley and three of his children and the driver, met a large wagon loaded with furze, tree branches, &c., and before it reached them the car was drawn close up into the hedge and stopped. As the wagon approached, the occupants of the car noticed that the driver was paying very little attention to his horse, and Mr. Hinsley shouted to him, but the load

was driven right into the car, the sticks reaching to the very centre of the vehicle. Mr. Hinsley's son had his arm torn, and the car, which had recently been re-varnished, was scratched. The man, it appeared, gave a false name at first. It was contended that there was plenty of room for the wagon to pass had the driver wished to do so, and it was stated that the driver had actually drawn in towards Mr. Hinsley's car in passing. The road was fifteen feet wide, and only three feet was allowed for the car to pass. Sir Charles Walpole stated that many carters occupied the middle of the road, causing other people to get out of the way, and forcing them into the gutter. Defendant had behaved very badly and would be fined 40s., or one month's hard labour. The list of successful prosecutions by the Motor Union in the defence of motorists and users of the highways generally is now very large, and others who have cases similar to that we have mentioned should communicate with the Secretary of the Union, at 1, Albemarle Street, London, W.

A View of the Start of the "Graphic" Trophy Race as seen from a Balloon.

To break our  
necks.

We should not like to think that Mr. Fawkes, of Farnley Hall, intended his speech at the meeting of the Wharfedale Rural District Council to be regarded as a serious contribution to the automobile problem. The Council was discussing a communication sent for their consideration by the Cheltenham Rural District Council in support of the minority report to the Motor Car Commission, when Mr. Fawkes said that he believed that in some foreign countries there was at the entrance to each village a gutter, and if the cars went over it at great speed they broke their springs. Certainly there was a footpath at Arthington that answered a similar purpose, and if a motorist went over it at more than six miles an hour he was thrown out of the car. This idea apparently so captivated the members of the Council that one of them said it would be better if motorists broke their necks instead of their springs. Possibly Mr. Fawkes

and his friends will not be surprised if we inform them that such is not the spirit in which local government should be conducted.

## THE "GRAPHIC" TROPHY.

LAST year the race for the "Graphic" Trophy fizzled out in a mist; this time the competitors were more fortunate and the climatic conditions were not averse to the contest, which was initiated in connection with the famous Irish Fortnight that followed the Gordon Bennett race in the Emerald Isle.

The course was over a stretch of road beginning at Quarter Bridge and finishing four and a half miles away on the road to Ballasalla—an "up and down hill" run. Although many of the motorists had sailed for the mainland there was a good concourse of spectators, headed by Lord Raglan, who was driven over the course on a 40-h.p. Crossley car which had been chosen as the pilot vehicle for the event.

One start is much like the other, for the variations are very few when the entrants are so experienced racers as set the pace for the Graphic Trophy. Some delay was caused by a protest made against the silencer of one of the Berliet cars—a protest, however, which was not supported by the deposit that would have given it form and force. The Daimler driven by Mr. Farnell made a false start, which was the premonition of trouble to the superstitious ones, who appeared very wise when the car subsequently stopped, and ultimately made the longest time of the day. Mr. J. E. Hutton, too, had ill luck, the water supply failing when he was near the end of his run, and thus putting him beyond the range of recorded time, which were as follows:—

	Car.	Driver.	Time. M. S.
1.	50-h.p. Napier ... ..	C. A. Glentworth ... ..	4 39
2.	30-40-h.p. Daimler ... ..	G. S. Barwick ... ..	5 3
3.	24-40-h.p. Berliet ... ..	W. Watson ... ..	5 7
4.	60-h.p. Beeston-Humber ... ..	C. H. Cooper ... ..	5 15
5.	40-h.p. Berliet ... ..	Bablot ... ..	5 45
6.	28-35-h.p. Isotta-Fraschini ... ..	H. E. Hall ... ..	6 23
7.	30-35 h.p. Sorex ... ..	E. A. Anthony ... ..	6 39
8.	20-h.p. Rapid ... ..	G. W. Roberts ... ..	7 26
9.	18-h.p. S.C.A.R. ... ..	H. A. Bate ... ..	8 18
10.	30 h.p. Daimler ... ..	A. Farnell ... ..	12 43

EIGHT entries have already been received for the Tourist Trophy race of next year.

THE award in our photographic competition, which closed on Saturday last, will be made next week.

THE race for the Vanderbilt Cup takes place on Long Island, U.S.A., to-day (Saturday). Lancia (Fiat) is looked upon as the probable winner, with Heath (Panhard) in second place.

"MERCEDES POINTS" is the title of a brochure brought out by Messrs. Ducros Mercedes, Ltd., of Long Acre, W.C., and gives a resume of the principal features of these well-known cars as well as hints on starting and driving. It will be sent to readers on application, and will doubtless prove of interest to a large number of motorists.

A NOTICE has appeared in the London Gazette respecting the liquidation of the Speedwell Motor and Engineering Company, Ltd. This notice is inserted according to the usual requirement of the Companies' Act, the business of the Speedwell Motor and Engineering Company, Ltd., having been acquired some time ago by the New Speedwell Motor Company.

THE entries for the Town Motor Carriage Competition of the A.C.G.B.I., which closed on Monday, are as follows:—18-h.p. White steam (two cars), 40-h.p. Napier, 14-18-h.p. Spyker, 12-16-h.p. Wilson-Pilcher, 12-h.p. Georges Richard, 15-h.p. Siddelay, 20-h.p. Lanchester (two cars), 8-16-h.p. Electromobiles (four), 14-16-h.p. James and Browne, 28-h.p. Ariel Simplex, 14-h.p. Georges Richard (two), 20-h.p. Pilgrim, 14-h.p. C.G.V., 16-20-h.p. Beeston Humber, 20-h.p. Dennis, 6-h.p. Electric (entered by Mr. Carl Oppermann), 10-h.p. Adams-Hewitt, 24-h.p. Germain, 22-h.p. Berliet, and 10-14-h.p. Renault.

# The Tourist Trophy Race.

DOUGLAS.

**T**WENTY-NINE likely starters was the number to which the entry list of forty-nine had shrunk when we retired to rest on the evening of the great race last week. Delays in construction, mishaps on the course, unpunctuality in arriving at the enclosure, and other causes had led to the withdrawal of many cars that promised well, and in whose performances much interest was centred. But motor-car racing has elements of uncertainty almost as "glorious" as in cricket, and there were a few sceptical persons who wondered if all the twenty-nine would face the starter in the morning.

Thursday morning came, and with it the twenty-nine cars. They all started in their proper order, but many were finished

the starting point was the vantage point throughout the day, and there all the leading items and incidents of the great contest were to be obtained—thanks to the admirable telephone arrangements and the presence on the course of half-a-dozen White steam cars in charge of Mr. Frederic Coleman, which were to look after any lame ducks that might fall by the way—evidence of the friendly assistance steam might render to petrol. A little variety was imparted to the scene as compared with last year by the presence of captive balloons, from which observers were able to follow the event from the "highest point of view," now and again at too elevated a height to render cars distinguishable on the road.

Of course we expected last year's winner to be the first back

The Timekeeper's Box.—The Hon. C. S. Rolls Finishes First.

before their time, and only a third came triumphantly through the ordeal, although ill-fortune rather than demerits led to the discomfiture of many.

Good starts were made in practically every case, and Messrs. A. V. Ebbelwhite and C. P. Glazebrook, the official starters, did not lose many seconds in getting the cars away at intervals of a minute and a half—a thirty-second extension made possible by the many eliminations which had taken place. There were few incidents to record, general sympathy going out to Mr. Tom Thornycroft, whose sprained knee required a support for his leg, which was slung outside the frame.

## THE FIRST ROUND.

When the last car had gone we settled down to the usual occupations of such a day, straining eyes to catch first glimpses of the cars as they whizzed past the grand stand or idling by the telephone exchange for news of the race. The enclosure at

again; and so it was, with the Rolls-Royce No. 4 in hot pursuit. Then came a second Scotch car, the Argyll, which had started ninth and had picked up wonderfully well doing the lap 3 4-5 sec. slower than the Hon. C. S. Rolls, who covered the first round in 1 hr. 0 min. 13 3-5 sec.—the fastest circuit of the day. And here, though somewhat out of its sequence, a curious coincidence may be noted, the Rolls-Royce made slower times for each succeeding round, while the Berliet, driven by Bablot, which ultimately came in second, steadily bettered its running as the day wore on, as is seen in the following comparison:—

	1st Lap.	2nd Lap.	3rd Lap.	4th Lap.
	H. M. S.	H. M. S.	H. M. S.	H. M. S.
Hon. C. S. Rolls ...	1 0 13½	1 0 46½	1 1 25½	1 3 35
M. Bablot ...	1 9 14½	1 8 34½	1 7 43	1 7 26½

*Revenons a nos moutons.* Hardly had we got over the surprise at the skill with which the Argyll was being driven by Mr. A. G. George when news of disaster began to spread, and it was

evident that the process of elimination had begun. Eventually it was ascertained that the following had to retire in the first round:—

No. 29, 24-h.p. Deasy, had change-speed gear troubles.

No. 48, 12-h.p. Vici, unfortunately ran into a ditch at Keppel Bridge owing to its steering gear going wrong; its further progress was impossible, a circumstance all the more regrettable,

Looked out! A group of Disappointed Entrants.

as considerable interest attached to its first appearance in any competition, especially as its driver, R. Lascelles, was acquainted with the course, having driven the Simms car last year.

Although their times were recorded for the first round, the following cars gave up at its conclusion and did not make a second venture for the reasons stated:—

No. 6, 22-h.p. Minerva, driven by Mr. Warwick J. Wright, with Mr. J. T. Moore Brabazon as mechanic, did not start on the second round, its clutch leather being burnt right out.

No. 36, the 16-h.p. Swift, had to retire owing to the sliding sleeve of the change-speed gear seizing.

#### SECOND ROUND.

There remained twenty-five cars for the second round. Mr. P. W. Northey, who had driven into second place last year, made very slow progress round the circuit this time, owing to a stoppage at Sulby Bridge because of a broken front spring. He started on the second lap, but did not go far. Tyre troubles now began to cause delay, but none suffered so severely in this respect as the Arrol-Johnston, which was stopped more than an hour owing to punctures. Mr. M. Ross Browne was travelling well on his Minerva and got into third position. Both the Stars travelled as consistently as they did in the first round, despite the fact that their bodies were really of the touring order.

The retirements on this round were as follows:—

No. 24, 18-h.p. Siddeley, owing to broken radius rod.

No. 5, 20-h.p. Rolls-Royce, broke the front spring.

No. 35, 14-h.p. Climax, had a broken crank-shaft.

Thus there remained twenty-two cars for the

#### THIRD ROUND.

Again the Hon. C. S. Rolls led, finishing 11 2.5 sec. in front of the Argyll, which, for a car of medium power, was doing remarkably well. Then it was discovered that this vehicle had lost some of its ballast. Immediately all thought of the way the sandbags had bumped and jumped over the rough road, and the reason was thus found. Investigation, however, revealed the fact that the floor-boards had given way and the ballast had reached the earth by the simple law of gravitation, a circumstance that elicited much sympathy for Mr.

George, whose driving had been a feature of the race thus far. His unofficial time for the whole race was 4 h. 28 min.—a speed of 38.38 miles per hour. In this round no fewer than four cars retired with their petrol exhausted, while before the last vehicle had completed the circuit Mr. Kolls entered upon the final lap. The cars that fell out in the third round were:—

No. 7, Mr. Ross Browne's 22-h.p. Minerva, rendered *hors de combat* by a burst clutch.

No. 8, 20-h.p. James and Browne, retired owing to defects in the water circulation.

Nos. 28 and 33, Star cars, ran out of petrol, as did also the S.C.A.R., No. 47, and Mr. MacConnell's Bianchi.

#### FOURTH ROUND.

Ere the last of the cars had completed its third round Mr. Rolls was thundering away on the last lap, with Mr. J. S. Napier hurtling along at a good speed. In fact, once rid of tyre troubles, the Arrol-Johnston did well, and actually did the fourth lap only two-fifths of a second slower than the first lap of the winning Rolls-Royce. Mr. Tom Thornycroft, who had pluckily driven with his leg in a sling rather than abandon the contest, had trouble with his plugs throughout the trip, and he ultimately stopped for want of petrol. Six cars came to a stop for want of petrol, Mr. Gordon Usmar wanting only another half-pint to take him to the timing station, and Mr. J. E. Hutton's Berliet stopping within a few yards of the finishing line. The eliminations during the last round were as follows:—

No. 3 (the 15-h.p. Darracq driven by Mr. S. Girling) stopped on Snaefell for want of petrol, as did also No. 26 (near the finishing point), No. 31 (on Snaefell), and No. 27 (Thornycroft), No. 37 (25-h.p. Hardman), and No. 46 (14-h.p. Academy).

The order at the end of the run is given below, the petrol consumption and miles run per gallon of each car being as follows:—

		Consumption of petrol.	Miles per gallon.
1.	Roll-Royce (No. 4) ... ..	6.369 gal...	25.27
2.	Berliet (No. 23) ... ..	6.406 ...	25.13
3.	Darracq (No. 2) ... ..	6.435 ...	25.19
4.	Clement (No. 15) ... ..	6.156 ...	26.15
5.	Beeston Humber (No. 17) ...	5.75 ...	28
6.	Coventry Humber (No. 18) ...	6.422 ...	25.07
7.	Arrol-Johnston (No. 1) ...	6.382 ...	25.25
8.	Siddeley (No. 25) ... ..	5.45 ...	29.54
9.	Scout (No. 32) ... ..	6.363 ...	25.3

The Hardman Car receiving its supply of Petrol.

Nothing could detract from the win of the Hon. C. S. Rolls, who has thus secured the trophy at a considerably faster pace—

39.5 miles per hour—than that of Mr. J. S. Napier—33.9 miles per hour—last year. In 1905 there were forty-two starters; eighteen finished. This year nine were officially received at the end of the race out of twenty-nine starters. Only the Rolls-Royce and the Arrol-Johnston have been among the finishing cars in both years, although the credit of such an achievement may also be given to the Argyll. In the first Tourist Trophy race the Beeston-Humber, Clement, and Scout were unfortunate in their petrol consumption; their performances last week, however, were eminently satisfactory in that respect, the first named having plenty of fuel to spare at the conclusion of the four circuits, which, in company with the Coventry Humber, had been most consistently traversed, as the following table, in which fifths of seconds have been omitted, will show:—

	1st lap.			2nd lap.			3rd lap.			4th lap.		
	h.	m.	s.	h.	m.	s.	h.	m.	s.	h.	m.	s.
Beeston Humber	1	14	4	1	13	28	1	13	42	1	14	46
Coventry Humber	1	12	35	1	16	47	1	15	31	1	16	0

These cars started eleventh and twelfth respectively, finishing fifth and sixth, thus qualifying, had such an award been available,

## SOME TECHNICAL FEATURES OF THE RACE.

ALTHOUGH the result of the 1906 Tourist Trophy race may be deemed satisfactory from the point of view of higher average speed and increased mileage per gallon of fuel of the successful vehicles, yet the relatively small number of the latter gives rise to the thought that the improvement which has taken place during the past twelve months has not been of an all-round character. Thus in 1905, out of the forty-two starters eighteen, or 42.9 per cent., finished, while 40.5 per cent. retired, either owing to breakdown or accident, and 16.6 per cent. failed from want of petrol. This year the number of actual starters was much smaller, and out of the twenty-nine only 9, or but 31.2 per cent., succeeded in finishing. The number of withdrawals due to accident or breakdown declined to 34.4 per cent., but on the other hand ten cars, or 34.4 per cent., ran out of petrol—a large increase as compared with last year. The principal feature of this year's event is, of course, the great increase in average speed.

### THE TIMES OF THE CARS ON EACH ROUND.

for a team prize. As it was they attained distinction for the Humber Company. The Berliet car was finely driven throughout, steadily winning its way from the unlucky thirteenth in the order of starting to fifth, fourth, third, and second in the four laps. It was noted that Mr. A. E. Crowdy drove his Siddeley car with the most economical consumption, and that, profiting by his experience last year, Mr. J. Percy Dean husbanded his resources and did not really attempt to make any great demonstration of speed, contenting himself with showing off the reliability of his car.

The investment of the presentation of the Trophy with a little ceremonial was a capital finish to a notable day. In the presence of the Club officials at the Palace—not (be it noted by strangers) the residence of Lord Raglan, but a place of popular resort—the Governor of the island handed the Trophy to the winner, who gracefully paid a tribute to the hard fortune that had been so unkind to the Car from Scotland—a reference that hugely delighted the sympathetic crowd and was well deserved.

In view of the altered course, it was fully expected that last year's best average of 33.9 miles per hour would be improved upon, but not to the extent of nearly six miles. As regards the fuel consumption, and looking at the figures for the winning car alone, it would appear that no improvement had taken place in this respect, the mileage per gallon, 25.27, being below that of the Arrol-Johnston last year, against which 25.4 miles was recorded. Striking, however, an average of the performance of all the successful cars, we find that just as the average speed has risen, so also has the quantity of spirit consumed fallen, the 1906 average for nine cars working out at 25.9 miles to the gallon, as against 24.3 miles for eighteen cars in 1905. While not sufficiently speedy to win the race, the performance of the Siddeley car, driven by Mr. Crowdy, is worthy of remark, his record of over 29½ miles to the gallon being considerably higher than the best result achieved in 1905.

Turning now to a brief survey of the competing cars, it may be mentioned that, with the exception of the Arrol-Johnston, all

were fitted with four-cylinder engines. Of the latter, the smallest were the Climax and Academy, they having a bore of 80 mm. by 90 mm. stroke, while the largest was the Hardman, 110 mm. by 130 mm. Both the latter, strangely enough, ran out of petrol. The Arrol-Johnston engine, which is of a design little exploited since the Koch heavy oil car of fragrant memory, deserves more than passing comment. Its two horizontal cylinders, with four pistons, give a rapid and large expansion without high piston speed that must otherwise accompany a long

less than twenty-four of the competing cars were fitted with magneto-ignition. Although ten were also provided with a reserve set of coil and batteries, it is a remarkable testimony to the efficiency of the high tension magneto system, however, that eight vehicles were fitted with high tension magneto only, one car had both low and high tension magnetos, five relied solely on accumulator ignition, while an equal number had only the low tension magneto. Of the cars which finished, three, including the winner, had both high tension magneto and coil

Mr. Grahame-White on the Siddeley Car, Rounding the Hairpin Corner, near Ramsey.

stroke, and there can be no doubt that this largely conduces to efficiency, which is apparently not detracted from to any important extent by the increased complication of the extra lever and connecting rod needful. Unfortunately, tyre troubles prevented the winner of the 1905 event repeating the success this year. Looking at the cylinder dimensions, we find a decided tendency towards the adoption of long stroke engines, as out of the twenty-nine actual competing cars only four had motors with equal bore and stroke, all the rest having a stroke greater than the bore. Gravity feed is still the favourite means as regards the supply of the petrol to the carburettor, seventeen cars employing this method as against ten having a pressure feed, and two with both systems. The result of the race was a case of honours divided, four of the nine vehicles which finished, including the winner,

and accumulators, three had high tension magneto only, two low tension magneto, and one accumulators.

As regards clutches, the leather-faced cone type still holds its own, twenty out of the twenty-nine starters being fitted with them. There was one instance of a car with a metal-to-metal cone clutch, and of the multiple disc type of clutches there were five examples. Of the nine machines which finished, six had clutches of the leather cone type, two multiple disc clutches, and one an expanding metal clutch. Turning now to the change-speed gear, all the cars had the sliding pinion type, twenty-four vehicles having four speeds and five three forward gears. With three exceptions, all the vehicles had a direct drive on the top speed. The Rolls-Royce has a direct gear on the third speed, while the Wolseley and James and Browne drive through a side shaft in

#### DETAILS OF THE NINE CARS WHICH FINISHED.

Order of Finish.	Car.	Driver.	H.p. at revs. per min.	Bore.	Stroke.	Clutch.	No. of forward speeds.	Transmission.	Average speed m.p.h.	Miles per gallon.
1.	Rolls-Royce	Hon. C. S. Rolls	22 at 1,000	3 15-16 in.	5 in.	Leather cone	4	LA	39.29	25.27
2.	Berliet	Hablot	22 at 1,200	100 mm.	120 mm.	Expanding metal	4	SC	35.4	25.13
3.	Darracq	A. Lee Guinness	15 at 1,200	90 mm.	120 mm.	Leather cone	4	LA	34.1	25.19
4.	Clement	G. Brand	22 at 1,000	95 mm.	130 mm.	Multiple disc	4	SC	33.6	26.15
5.	Beeston Humber	T. C. Pullinger	20 at 1,000	100 mm.	100 mm.	Leather cone	4	LA	32.6	28
6.	Coventry Humber	L. Costalen	20 at 1,000	4 in.	4 in.	Leather cone	4	LA	32.1	25.07
7.	Arrol-Johnston	J. S. Napier	18 at 1,000	4 3-4 in.	6 1-2 in.	Multiple disc	4	LA	30.2	25.25
8.	Siddeley	A. F. Crowdy	18 at 1,000	4 in.	4 in.	Leather cone	4	SC	27.8	29.54
9.	Scout	J. P. Dean	20 at 1,200	90 mm.	115 mm.	Leather cone	3	LA	23.1	25.3

having pressure feed, four having gravity feed, and one both systems. Coming to the question of automatic governors, twelve of the cars which competed were without governors at all, and of the cars which were governed only one, the Arrol-Johnston, was adapted to act on the exhaust valve. Fourteen cars had the governor operating on the throttle, while on two cars it was arranged in such a way as to vary the lift of the inlet valves. Six of the cars which finished had governors. A further point of interest was the varying methods of ignition adopted. No

the gear-box on all speeds. The method of transmitting the power from the gear-box to the road wheels has resolved itself into the use of two systems—the side chain transmission and the cardan shaft with rear live axle. The latter was the most popular, eighteen of the competing cars being fitted with this transmission and eleven with the side chain drive, while the relative figures of the vehicles which finished were six and three, figures which also exactly represent the number of British and foreign (French) cars which survived the ordeal.

## SOME VIEWS ON THE TOURIST TROPHY RACE.

BY H. H. P. DEASY.

A RACE such as that for the Tourist Trophy is of great value to the public and to manufacturers, and it is only by modifying the rules, as the result of practical experience obtained by the holding of the race, that its value and interest to the general public will be enhanced each time it is held. With a view to exclude from the Tourist Trophy Race cars that are not ordinary touring cars such as are sold to the public, I would suggest the following modifications of the rules for next year's race:—

1. The minimum chassis weight to be increased to about 2,000 lb., with a view to the fostering of a strong, serviceable type of car, suitable for ordinary touring conditions. 2. A minimum clearance of 10 in., so as to discourage low chassis, which are such

Club, except by permission, and under official observation. 8. The minimum dimensions of the body to be increased, and the minimum weight of the body to be decreased. Several competitors in this year's race had to fasten large quantities of sheet lead, &c., on the floor boards in order to raise the weight of the bodies to what was necessary to comply with the rules. 9. The allowance of petrol to be increased, as it is very doubtful whether cars of the suggested increased weight could do twenty-five miles on one gallon of petrol. Mere speed is now a far less important factor in judging motor-cars than many others, such as strength, size, weight and general suitability for touring and ordinary use. 10. The order of starting in the race to be determined by ballot. 11. Practising on the course to be strictly limited, and those competitors who break this rule to be subject to a heavy fine, and disqualification if the rule is broken twice. I was informed that practising on the course was indulged in at all hours of the day for some time previous to this year's race. 12. Heavy fine for inconsiderate or reckless driving in the Isle of Man and

Mr. J. Percy Dean on his Scout Car passing through Ramsey.

Photos by]

Mr. J. S. Napier on his Arrol-Johnston passing one of the Official White Steam Cars on Snaefell.

[Mr. Frederic Coleman

a fruitful cause of raising dust. 3. A minimum track of 4 ft. 3 in., which will be necessary if the previous suggestion is adopted. 4. A minimum distance from the dashboard to the front edge of the back tyres of 1.6 metres, as this is the distance which nearly always regulates the size of the side doors and dimensions of the front seat. The minimum wheel base might well be discarded, as if manufacturers can build cars with short wheel bases, complying with the above rule, that can be driven in safety at a high rate of speed on a course like that in the Isle of Man, so much the better. 5. The efficiency of silencers to be tested. 6. That, in lieu of debarring from the race those competitors who arrive late, they should be allowed to compete, provided they pay a suitable fine, which might well be on a sliding scale, according to the amount of time their cars are late. 7. No adjustments of any kind or description to be allowed after the cars have entered the enclosure and been handed over to the

disqualification if repeated. I saw two competitors driving out of Douglas on a dusty road at a speed that was very excessive, and decidedly dangerous. The amount of dust raised by those two enemies to automobilism was sufficient to add materially to the difficulties of obtaining permission to hold another race in the picturesque Isle of Man. I venture to prophesy that, if practising on the course is not strictly limited to certain times, and if stern measures are not taken to prevent reckless and inconsiderate driving in the Isle of Man at race time, the roads of that now hospitable and friendly island will no longer be available for the Tourist Trophy race. 13. It is now high time to encourage the use of alcohol, or some other fuel than petrol. I therefore suggest that three substantial money prizes be given to the three cars running on any other fuel than petrol (the price of which must not exceed 1s. per 20 miles), which make the best performances in next year's race. This is a matter which might well be taken up by the Society of Motor Manufacturers.

## THE DORWALD CARBURETTOR.

**I**N a recent issue we referred to a new automatic petrol-paraffin carburettor which has been devised by Mr. G. L. M. Dörwald, and which is being put on the market by Messrs. Geo. Neal and Co., of Fenchurch Street, London, E.C. We are now able to give some further particulars of the device, the action of which will be gathered from the illustrations herewith published. The carburettor consists of two float chambers, A B (Fig. 2)—one for petrol and the other for paraffin. The motor is started on petrol in the usual way, the feature of the apparatus lying in the automatic mechanism, by which the change from petrol to paraffin is made when the desired temperature is attained. Into the spraying chamber, which also serves as an air inlet pipe, opens a nozzle C for supplying the petrol, and a second nozzle D through which the paraffin is sprayed, they each being fed from one of the independent float chambers. Within the spraying chamber is a lever E fulcrumed between the two nozzles, one end and the centre of the lever being provided with cones for securely closing the outlets in the same. On the other end of the lever rests the spindle of a valve K, covering an air inlet to the mixing chamber, the valve being kept normally closed. Above

the spraying chamber is the automatic change-over or disc chamber G, within which is arranged an ingenious thermostat, consisting of several "ether capsules" H. The latter are constructed of two thin corrugated copper discs, enclosing cotton wool pads saturated with ether. The necessary heat to vapourise the paraffin is obtained from the exhaust gases, which are also utilised in connection with the operation of the thermostat; to this end the burnt gases are caused to

the paraffin jet, and at the same time forcing up the air inlet spindle F to permit the admission of the requisite quantity of additional air to the mixing chamber. Simultaneously another small valve, operated also by the lever E, closes the inlet to the jacket of the disc chamber, in order to prevent the "ether capsules" from becoming overheated. When the petrol nozzle is open and the petroleum one closed the air drawn in through the opening J at the extreme left of the spraying chamber is then mixed with the inflowing spirit, the explosive mixture thus

formed passing into the combustion chamber of the engine along the pipe M N, O being the usual piston-type throttle valve. When the exhaust gases have heated the capsules in the chamber G to the proper temperature to vapourise the heavy hydrocarbon the petrol nozzle is closed and the paraffin one opened, the escaping heavy hydrocarbon then becoming vapourised and passing to the engine. Simultaneously the air valve is opened to supply the larger quantity of air needed for the heavy hydrocarbon, and almost immediately afterwards the circulation of the exhaust gases round the chamber G is diverted. An auxiliary air valve is provided at L, this being arranged to open when the engine exceeds a predetermined speed. The automatic change over from petrol to paraffin is extremely ingenious, and under normal working con-

ditions takes place in from five to six minutes after starting up the engine.

One of the Dörwald carburettors has recently been fitted to a 24-30-h.p. Dennis double-deck vehicle, belonging to the Southend Motor Omnibus Company, and a demonstration of the same was made a few days ago, a run of seventeen miles from Southend to Rochford and back being undertaken. The consumption for the journey was 1 pint of petrol and

Fig. 1.—General View of the Dörwald Automatic Petrol-Paraffin Carburettor.

Figs. 2 and 3.—Longitudinal and Transverse Sections of Dörwald Carburettor.

pass through the jacket surrounding the mixing chamber, while a portion is diverted to the disc-chamber jacket. When the engine is started cold only the petrol nozzle is open. As soon, however, as the exhaust gases have heated the disc chamber G sufficiently the capsules expand, and by means of a short spindle connected therewith depress the extreme left end of the lever E, so closing the petrol nozzle. As the lever is pushed down at one end it rises at the other, thereby opening

1½ gallons of paraffin. Taking the former at 1s. 1d. and the latter at 5d. per gallon, the total fuel cost for the seventeen miles was 10.37d., or .61d. per mile. The carburettor, as fitted on the bus referred to, differs slightly from that shown in the drawings given herewith, several minor alterations having been made during the experimental stage. In the first place, in stead of four "ether capsules" only two are now employed, these having proved ample for the work.

At the end of the Tourist Trophy race Lord Raglan was driven home on the Beeston Humber car which had done so well in the contest.

THE Drill Hall and other convenient buildings in Blackpool have been secured by Messrs. Jackson Bros., of the Central Motor Garage, Abingdon Street, Blackpool, as garages during the forthcoming meet.

MESSRS. S. J. WILLIAMS AND CO., of Shepherd's Bush Road, London, have submitted samples to us of a new waterproof material they are introducing for motorists' clothing. It appears to be light and durable, and should be of interest to motoring tailors, to whom it is intended to supply the cloth in the piece.

The 30-h.p. Hotchkiss recently supplied by the London and Parisian Motor Company, Ltd., to Mr. V. A. Little. The vehicle is fitted with a luxurious limousine body by Hooper.

AMONG engineering firms interested in automobilism who are encouraging their younger workers to become thoroughly efficient in their work is that of Hans Renold, Ltd., of Manchester, who are refunding the fees paid by employees who regularly attend classes in approved public institutions in the city.

A MOTOR-CAR manufacturer, at Clerkenwell County Court, added to an explanation that he took no responsibility in allowing one of his drivers to instruct a new hand in street driving, "That is a trade custom." To which Judge Edge retorted:

There is nothing in that. The trade is too recent to have established a custom."

A FACTORY operative named Alice Whitworth, Broadley Fold, Healey, was summoned at Rochdale for an assault on Mr. Herbert Bright, who stated that while he was motoring along Whitworth Road on the evening of September 6th the defendant threw a tea can at him. The can missed him but hit one of three ladies in the car. The chairman said this was an offence which was becoming far too common. A fine of 5s. and costs was imposed.

MESSRS. DAVIES BROS., of Llanelly, are disposing of their interest in the Stepney Spare Wheel, the merits of which have been fully set forth in the *M.C.J.* on previous occasions, to a company, in the formation of which Messrs. Trapnell and Co., of Cheltenham, are taking much interest. The manufacture of the wheel has grown so rapidly that 1,000 wheels were actually delivered in August last, and the invention is receiving recognition on the Continent as well as in this country.

As a motor-car was going down Bridge Street, Witham, it had to pass another car running in the opposite direction. At the critical moment a little girl ran across the road from behind the latter car, and would in all probability have been seriously injured if the driver had not immediately turned his car sharply to the right, running into the front of a house, knocking out a few bricks. Upon striking the house the car rebounded into the road and stopped. The occupants escaped with a severe shaking and the child was unhurt.

## HERE AND THERE.

THE regulation limiting the speed of motor-cars in certain streets of Harrogate to ten miles per hour came into force on Monday last.

THE staff of the Automobiles de Luxe, Ltd., have made a presentation to Mr. R. W. King, who has been chartered accountant to the firm. The event took place at a dinner in honour of the recipient last week.

A skittish new motor at Croydon  
Her master declared was a hoyden,  
She was fast and provoking  
And frequently smoking,  
That Miss-behaved motor at Croydon.

E. M. M., Bromley.

A NEW automobile soap has been brought out by the Sanitas Company, Ltd., of Locksley Street, Limehouse, E., which, from the trial we have given, will do thoroughly all that is claimed for it in the way of removing grease and oil from the hands of motorists, chauffeurs, machinists, &c. At the same time it minimises the drying and injurious after effects usually attendant on the use of a grease remover.

THE Parliamentary Committee of the Trade Union Congress has consented to assist the Cabmen's Union to try and obtain the use of Hyde Park for hackney carriages. The present regulations restrict the use of the park to the owners of private carriages and motor-cars, to the exclusion of the cab-hiring public and to the detriment of cabmen. This arrangement is said by the drivers to give an undue advantage to private jobmasters.

THE New Arrol-Johnston Car Company, Ltd., have lately issued a useful little handbook of the 12-15-h.p. new Arrol-Johnston car. It gives full instructions as to the lubrication, care, and running of these vehicles, and should prove indispensable to users of this model. The handbook, which is fully illustrated, concludes with a number of hints to drivers and a price list of spare parts, the ordering of which is facilitated by each being given a definite number.

The 40-h.p. Crossley landaulet just shipped by Messrs. Jarrott and Letts, Ltd., to the President of the Chilian Republic.

In view of the fact that there are practically no cars in Chili, it is noteworthy that the President was not satisfied with a carriage of low power, but considered that only one of the most powerful type would suit his requirements.

A MOTOR-COACH, or char-a-banc, with a carrying capacity equal to a dozen passengers, will probably be put on the road between St. Kilda and Port Melbourne, Victoria, at an early date, a syndicate having recently purchased one of these vehicles for that purpose.

A MOTOR volunteer corps is reported to be in course of formation in Russia.

MESSRS. A. WOOD AND SONS have a motor garage at 132, High Street, Hounslow.

MESSRS. WEST, LTD., have lately supplied a 20-22-h.p. West car to the Bristol Corporation.

THE Shanghai municipal authorities have ordered a Beaufort Princess phaeton for the use of their officials.

ALL well-designed cars nowadays embody some form of additional air inlet in connection with the carburettor, but it is by no means general, and on motor-cycles in particular it is still very rare, while there must still be running on the roads a multitude of cars and cycles which contain no provision at all for an extra air supply when needed. In this connection the arrangement just introduced by the Bowden Patents Syndicate, Ltd., is of interest, as it has the recommendations of being inexpensive, light in weight, simple in construction, and applicable to any existing machine. The accompanying illustration will give an idea of the attachment, which is operated by the Bowden wire mechanism, and the following description will make it still more clear:—C is the body of cylindrical form having a circular opening G in its side or wall. This opening is covered by a fine gauze, the object being to exclude grit and other foreign matter. B is a bucket or plunger which is a good fit for the interior diameter of C. The bucket is closed at the top, so that when

below the opening G no air is admitted, but when drawn upwards by means of the wire mechanism a triangular-shaped aperture registers more or less with the gauze-covered opening G, and allows air to be drawn in. A is a screwed cap closing one end of the body piece C, the object of the thick stem being to carry the adjustable stop F, and to take the circular spring used for returning B to its normal position. The other end of the body C is so shaped as to be a close fit over the inlet pipe of the motor. D is a screwed stem for passing at right angles through the inlet pipe, E being a shaped washer and nut which, when screwed up, holds the device tightly to the inlet pipe, no other fixing being necessary. The device will work in any position, so that it may be placed at the most suitable part of the inlet pipe. The method of fitting is as follows:—Drill one side of the inlet pipe with a hole  $\frac{3}{4}$  in. in diameter. The opposite side must be drilled  $\frac{1}{4}$  in. Pass the stem D through the large hole and out through the small one, then make all tight by the nut and washer.

A RESIDENT of Saffron Walden, who has been engaged in making armorial bearings for harness for the last fifty years, says that since the introduction of motor-cars the industry has collapsed.

FOR the second year in succession the Tourist Trophy race has been won by a car using the "Shell" motor spirit of the General Petroleum Co., Ltd. This fuel was also used by the winner of the Graphic trophy, on the following day.

THE County Chemical Company, Ltd., have opened a depot at 235, Deansgate, Manchester.

AT Lower Ford Street, Coventry, Mr. Edward Hewer is commencing the manufacture of motor-car bodies.

TWO out of the first three cars that finished in the Tourist Trophy race were fitted with "Continental" tyres.

MESSRS. DEAN AND BURDEN, LTD., are erecting a new factory near the L. and S.W.R. station at Salisbury.

EARL MANVERS has developed into an enthusiastic motorist, and may frequently be seen motoring to the meets of his hounds.

MOTORISTS driving through the New Forest and Epping Forest are asked by the respective verderers to drive with care and caution.

CAPTAIN W. F. O'CONNER, the British Trade Agent at Gyantse, and the adviser of the Grand Lama of Tashi-lhunpo, is taking an 8-h.p. motor-car out to Tibet.

AMONGST recent purchasers of Humber cars are the Duke of Marlborough, Lord Amptill, Lord Howard de Walden, Lady Inverclyde, Sir William Cooper, and Dr. Wood, headmaster of Harrow.

THE motor mail service arranged by the postal authorities for the Sleaford and Bourne districts of Lincolnshire has been abandoned, it having been found after trial trips that the hills in the Falkingham district cannot be negotiated with certainty.

MR. HENRY F. JOEL, A.M.I.C.E., who has had considerable experience with electrical motor-cars, has taken offices at 110, Strand, London, W.C., where he purposes practising as a specialist on such vehicles, and to practice as a consulting electrical engineer.

THE Caledonian Tyre Repairing Company, 52, St. Enoch Square, Glasgow, have brought out a "burst tyre gaiter," which is fitted between the cover and the tube. They have also introduced a new device in motor tyre wrappers which is proving a great success. It can be attached and detached in thirty seconds.

WE learn from Messrs. J. Keelo and Co. that they have been appointed sole agents in London, Kent, Middlesex, Hertfordshire and Essex for the pleasure and commercial cars built by the Enfield Autocar Company, Ltd. For the 1907 season two models of the former will be built, 15-h.p. and 20-30-h.p., while the industrial vehicles will comprise one and three-ton vans and lorries.

MR. MITCHELL, of the Palmer Tyre, Ltd., has made a careful study of pneumatic tyres and attaches great value to testing the pressure of tyres previous to starting out on a journey. The Palmer Tyre, Ltd., are selling a special gauge put up in a neat leather case, by the use of which it is not necessary to have a pressure gauge attached to the pump. The latter can be used with or without this gauge, as it is so fitted that by turning on a cock one can use it with a pump, and by turning it back it can be used as a test for the pressure. Therefore by using this gauge there is no necessity to take out the pump to test the pressure.

AN ingenious lamp shade for use on the head lights of motor vehicles, to prevent powerful lights being a danger to other road users, and to increase their effective range, has recently been devised by Mr. K. H. Evans, of Exeter. The shade consists of a number of thin plates fixed horizontally in front of the lamp in such a manner that the parallel beam of light is not interfered with except by the edges of the plates, which should be as thin as possible. Plates only  $4\frac{1}{2}$  in. wide from front to back and  $\frac{1}{2}$  in. apart give a very great amount of protection, all the light which would rise and dazzle other road users being caught by the underside of the plates and reflected downwards. The upper side of the plates being dull black, all stray light falling on them is absorbed, and none reflected upwards. Mr. Evans informs us that the arrangement is based on the following principles:—"1st, The brighter the foreground is illuminated the more difficult it is to see distant objects. 2nd, Rays of light which rise are useless to the driver and dazzle other road users." In view of the many objections which have been made to the glare of headlights, Mr. Evans' arrangement is well worth consideration.

## CONTINENTAL NOTES.

## The International Balloon Race.

Rarely has Paris been so excited over a sporting event as on Sunday last, when the first international balloon race was started from the Tuileries Gardens. Altogether sixteen balloons went up, France being represented by three competitors, Germany three, Spain three, Belgium and Italy one each, America two, and Great Britain three, the British contestants being Mr. F. Hedges Butler, Prof. Huntington and the Hon. C. S. Rolls. The first balloon was let loose at 4 p.m., the last one—that of Prof. Huntington, getting away at 5.16 p.m. The competitors drifted slowly away towards the west, the breeze varying between E.N.E. and E.S.E., which destroyed all chance of beating the long-distance record of 1,203 miles made by Count de la Vaulx in October, 1900. News of the aeronauts began to arrive early on Monday morning, and as the telegrams came in it was found that nine of them, including Mr. Butler, had descended on French soil, while the seven others had been carried across the Channel into England. Some anxiety prevailed as to the whereabouts of Mr. Rolls, as he was not heard of until mid-day Tuesday. It appeared, however, that he came to earth near Sandringham on Monday night, after being in the air just over twenty-six hours. The leading competitors have been placed as follows:—1, Lieutenant Lahm (America), landed near Whitby 400 miles; 2, Signor Vonwiller (Italy),

on the 28th inst. Categories will be provided for both racers and tourists, the usual classes being provided for in each section. The trials will take place over a distance of a kilometre, a flying start being allowed. In conjunction with the meeting it is also proposed to organise a series of kilometre speed trials on the level at Dourdan for the 21st inst.

## A German Reliability Trial.

Under the auspices of the German Motor Cyclists' Union a three days' reliability trial has just been held in Germany. The first day's run was from Berlin to Breslau, a distance of 325 kilometres; the second, from Breslau to Dresden, 299 kilometres; and the third, from Dresden to Leipzig and back, 271 kilometres. There were forty-six entries and of these thirty-three started. In the class for cars up to £125 the winner was Herr A. Ruppe on a Piccolo, and in the £125-£175 section Herr Ressler on a Lautin-Klement voiturette. The first-named made a clean score, while the latter was only penalised to the extent of ten marks.

## Motor-Cycle Races in France.

The Auto-Cycle Club of France is organising a race for touring motor-cycles for the 28th inst. The event will be held on a forty-two kilometre course, which, starting at Dourdan, takes in Anthon-la-Plaine, Ablis, and Saint Arnoult. This will have to be covered five times, giving a total distance of 210 kilometres. The competing machines will be divided into the

The Tourist Trophy Race.—Mr. J. S. Napier on his Arrol-Johnston Car at Willaston Corner.

reached New Holland, Lincolnshire, 370 miles; 3, Comte de la Vaulx (France), landed at Walsingham, Norfolk, 294 miles; 4, C. S. Rolls (England), 287 miles. Captain Kindelau (Spain) came down near Chichester, M. Balsan (France) at Singleton, and Professor Huntington (England) near Sittingbourne.

## Motor-Car Regulations in Germany.

A new series of motor-car regulations came into force in Germany on the 1st inst. The following are the principal clauses of the same:—All cars must be provided with strong steering gear and be able to turn in a small circle; two separate brakes must be fitted, and all vehicles weighing over 7 cwt. must be capable of reversing. Every vehicle must carry a plate fitted by the maker showing the horse-power and weight of the machine, and in addition carry identification plates both at the back and front. No person under eighteen years of age may be entrusted with the driving of either a motor-car or motor-bicycle, nor anybody else who has not satisfied the proper authorities that he fully understands the management of the vehicle and is without a certificate of proficiency countersigned by the police of the district where he resides.

## The Gaillon Hill-Climbing Competition.

The annual hill-climbing competition on the Sainte Barbe hill at Gaillon, France, organised by the "Auto," is to be held

following three classes:—1, light motor-bicycles of a maximum cylinder capacity of 220 cubic centimetres; 2, motor-bicycles of a third of a litre cylinder capacity; and 3, tri-cars 500 cubic centimetres engine capacity.

## Public Services in Germany.

A proposal to establish a public motor-car service between Slegsdorf and Bad Reichenhall, Bavaria, is under consideration. A company has just been formed at Steinen, Baden, to run a number of motor-vehicles in the district. A number of single-deck buses have lately been put in service between Wiesbaden and Schlangenbad.

## A Swiss Fuel Consumption Trial.

The Geneva Section of the Swiss Automobile Club is organising a consumption trial for the 16th inst. It will be held over a 130 kilometre course, the award being made on the formula: total weight divided by quantity of petrol consumed.

## Miscellaneous Items.

A service of motor-cabs is shortly to be started in the town of Mainz, Germany.—A 20-kilometre motor-bicycle race is to be held on Sunday next on a 30-kilometre course near Barcelona, Spain.—The formation of a motor volunteer corps is reported to be receiving the consideration of the Swiss military authorities.—Five 16-h.p. Pilain cars are now being used by the postal authorities at Lyons.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
87-88, Charing Cross Road, W.C.]

### A TRIBUTE TO THE M.C.J.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As you are aware, we are holding a tourist trophy competition, and we would be obliged if you would send a representative round here on the 28th to witness the opening and judging of the guesses of the competition.

The majority of the forms have been taken from the *M.C.J.*; hence our reason for asking you to favour us as above; and again, we think it will be interesting for you to see the very great number of letters we have received from competitors in all parts of the country, the majority of whom, we take it, are regular readers of your paper. Thanking you in anticipation of acceding to our request.—Yours truly,

THE PROPRIETORS OF "THE MOTOR HOUSE."

trials, I should like to give my experiences. I asked permission to run Stanley steam cars, and not being a member of the clubs entitled to run in this meeting, I was unable to enter cars unless I became a member. The secretary of the Notts. Club very kindly told me that if I sent my subscription I could join this club and run my cars. This I accordingly did, and entered cars in classes C, D, and E, that is, in the £200, £350, and £500 classes. This occurred a week before the races. The day before the races I was ready with my three cars in Manchester to start for Skegness, 130 miles. At 10 o'clock in the morning of this day I received a programme of the races. The car I had entered in the £200 class was put in the £350 class, the one entered in the £350 class in the racing event (this latter machine was put to run against the 100 h.p. Darracq in its heat), the machine entered in the £500 class was correctly placed. As all my cars absolutely complied with the rules of the race committee and my entry forms were filled in correctly, also illustrated catalogues of the different machines sent, I leave it to the motoring public to judge as to the conduct of the committee of the Notts. Club in connection with these trials.—Yours truly,

F. WILKINSON.

### HANDCROSS HILL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—During the inquest on the persons injured in the recent motor-bus accident on Handcross Hill, it was suggested by Mr. Beaumont in his evidence, and I think by some other persons, that the hill was in a dangerous condition, and that it should be altered,

Preparing for the Tourist Trophy Race.—The Scene in the Enclosure at Douglas.

### EMANCIPATION DAY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been surprised to notice that whilst the suggestion has been made, and is being taken up, that a meet of motorists should be held on November 14th to celebrate the tenth anniversary of the abolition of the red flag and three-mile-an-hour speed limit, no mention has been made of heavy vehicles.

Great though the progress since 1896 has been in touring cars, in commercial vehicles it has been greater, and, therefore, no celebrations would be complete that left out of account the utilitarian vans, lorries and omnibuses, which the above-mentioned law served to create.

Cannot you, with the great influence your journal possesses, suggest a meet on November 14th of commercial vehicles somewhat on the lines of the old May-day parade on the Embankment, that served so admirably as landmarks in the records of progress. Needless to say, I shall be pleased to start the ball rolling by arranging for the presence of a set of Beaufort commercial vans, buses and lorries.—Yours truly,

J. EDGAR LOUND.

### STEAM CARS IN COMPETITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Seeing that certain gentlemen have considerable grievance against the Notts. Motor Club in connection with the Skegness speed

both in the matter of camber and also in that of gradient. The crown of the road is undoubtedly a great deal too high. On so steep a gradient as this very little camber would be sufficient. On the question of gradient, the hill road has already been raised in one part by about 18 ft., but this was insufficient. It would not be a very expensive matter to make a new road for the upper portion of the hill, the new road commencing either from the foot of Handcross village street or from a point from between this spot and the angle in the present road at which the hill commences. This new portion of the road would join the present hill road at a point about one-third of the way down the hill. In addition to this, the raised portion of the hill should be further raised about 10 ft. The two alterations would materially reduce the gradient of the hill and render it much safer for all traffic.

Long before this motor-bus accident occurred Handcross Hill was notorious for frequent vehicle accidents. It is decidedly the sharpest gradient in the length of the road between London and Brighton, and this road has in all probability the largest road traffic in the South of England for a fifty-mile stretch of country road. In 1897 I myself had an accident there with what was, I think, the first motor-van built in this country. It was during one of the earlier long trial runs of the van. The vehicle was a covered-box van having a twin-cylinder engine of about 15 h.p., and was loaded on this occasion with one ton of old iron, chiefly in the form of anvils and flywheels. The van ran well and without incident as far as the top of Handcross Hill, carrying its load of old iron, the foreman, who was driving, a fitter, and myself. Having

passed the brow of the hill, the speed increased, in spite of our ramming on the brakes as hard as possible. With the increasing speed it took a serpentine course from side to side, until the speed and swaying of the van were such that, in spite of the efforts of the driver, the van charged the bank on the left. This was at a point, I think (from the statements appearing in the Press at the time of the 'bus accident), a little higher up than that at which the 'bus struck. One wheel ploughed through the bank; the off wheel, striking at a greater angle, was flattened sideways against the bank, which circumstance probably saved the man and ourselves from dropping about fifteen feet into the field at the side. The driver was shot out of the front, but saved himself from dropping into the field by gripping hold of some part of the front of the van. The fitter was thrown into the hedge. At the moment of impact I saw an anvil and a flywheel rising from the floor to meet me, but fortunately these only barked my legs, what time my head came into contact with the closing partition at the front of the van, which also arrested the flight of the anvils and flywheels. We found on examination that the leather on the brake drums was burnt.

It would be doubly unfortunate if this lamentable 'bus accident should pass into the have-beens without any attempt being made to remedy the dangerous condition of the hill in some manner.—Yours truly,

J. D. ROOTS.

### BETTING ON THE RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I noticed with regret that certain journalists connected with the daily Press have been recording evidence of betting taking place on the Tourist Trophy race. Of course it is impossible, I suppose, to wholly suppress this love of gain in such a way; but it is a pity that it has been introduced into motor events, and there are many members of the Automobile Club who deplore the practice.—Yours truly,

A COUNTRY RECTOR.

### SUNDAY MOTORING—A SUGGESTED NEW TAX.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am not the fortunate possessor of a motor-car, and therefore when I am on the public roads I am more acutely conscious of the disadvantages than of the advantages of motoring. I recognise, however, that the motor-car has come to stay, and that all the wild talk one hears and reads about preventing motorists from using the public roads is so much nonsense. It is clear to me also that we cannot circumscribe motoring within a certain area or confine it to particular roads, and thus I am driven to the conviction that the proper limitation would be one of time and not of space. Viewed from this standpoint it is clear that there is one day in the week on which the general public has a much larger interest in keeping the roads free from the nuisance of dust and smell and danger—I must urge you to recognise that these are very real annoyances to the pedestrian—than he has upon others. That day is Sunday. Sunday is practically the poor man's only day in the country. We are now an urban people, and the clerk, artisan and shopkeeper can only hope to get into clean air and among the trees on a Sunday. Therefore I think that the claims of the many poor pedestrians and bicyclists ought on that day to outweigh the claims of the few rich motorists. I suggest that a heavy licencing fee should be levied upon Sunday motoring. I think that the fee should in the first place be sufficiently heavy to be prohibitive to the majority of motorists. What that figure should be I do not venture to suggest, but, for the sake of argument, I put forward for discussion a fee of £100 a year. Every motorist who wished to motor on Sunday would have to take out a licence and carry it with him on Sunday, and the various policemen who are on duty to prevent an illegal rate of speed would check the licences; the machinery for inspecting the licences is in fact already in existence.

Such a tax upon Sunday motoring would not interfere with the commercial and industrial uses of the motor: it would, in fact, be a tax upon the rich man's amusement, which is of all taxes the most legitimate. The tax would serve the purpose for which I propose it if the number of motors on the high roads was greatly diminished upon Sundays; it is not absolutely necessary to postulate that the motor should be driven clean off the roads on that day. One is not annoyed by meeting one or two in the day, but by the continual rush and whirr of these great vehicles flying past at a high rate of speed, and turning the most beautiful parts of the country into the likeness of Clapham Junction. Therefore, if a few very rich men were to persist in motoring on Sunday I do not think that there would be much complaint, and the Exchequer might realise a handsome profit. If only 5,000 motors in all England, Scotland, and Ireland were to appear on the highways on Sunday the profit to the public revenue would be half a million, or something less than half a million if the "police traps" were debited to the national Exchequer. But I do not wish to lay stress upon the financial advantage of the proposal, as my object is to reduce Sunday motoring to very small dimensions.

I can understand that there may be a considerable outcry from motorists against such a proposal, because many of them are busy men who can only get away from work on Sunday, and because they would therefore be deprived of almost their only opportunity of enjoying what are, I suppose, the pleasures of motoring. I recognise that this is so and say that it is a balance of rival claims and that the interest of the

greater number ought to prevail. *Ceteris paribus* it is more likely that the rich man can take a holiday on a weekday than the poor man, and therefore many of them who are not prepared to pay this heavy fee will take their motoring pleasure on some other day—Saturday is obviously the day which they will choose. For the very considerable number of motorists who cannot indulge in a whole holiday on Saturday, the licence upon Sunday motoring would be, I recognise, an inconvenience, but the dissatisfaction against the existing practice is so strong, that unless motorists are prepared to make some concession to the general public, with whose convenience they so greatly interfere, other restrictions much more severe will certainly be imposed upon them. I believe that if the many candid and temperate lovers of motoring, who recognise that they do inflict a considerable amount of discomfort on their fellow citizens, were to join hands with those who desire to see reasonable restrictions imposed, they would save themselves and the other more reckless motorists from the vindictive legislation of a not very patient democracy.—Yours truly,

T. MORISON.

### AUTOMATICALLY-CONTROLLED IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As the questions of automatic timing and the most effective method of controlling the carburettor have been a good deal discussed lately, we wish to point out that we believe we were the first firm to automatically adjust the moment of the spark to suit the speed of the engine, and that our system of positively controlling the carburettor,

The Argyll Motor-car on the Devil's Bridge at Kirkby Lonsdale.

somewhat similar to that adopted by the Albion Motor Car Company gives undoubtedly the best results. We fitted the governed ignition as early as July, 1903, and we were therefore fully seven months ahead of the Brotherhood-Crocker Company. We still have the original engine to which this was fitted, and the method of advancing the spark now in use on our cars is identical with that first constructed. We also adopted on our first car the positive control of the carburettor by means of the governor. The mixture is thus controlled and regulated so that it is always scientifically accurate, both in regard to the speed of the engine and to the work the engine is called upon to do. This has enabled us to have the simplest of all controls.

We have only one control lever, which is set to give the maximum speed required at any time, and the engine then attends to its own adjustments, and keeps very closely indeed to this maximum speed, provided the hills are not too severe.

We have still further developed this simplicity of control by fitting only two pedals. One decelerates the engine—and therefore the car—until the engine is only just running, further movement of this pedal then applying the main brake. The other pedal controls the clutch in the ordinary manner. The great advantage of this arrangement is that to slow or stop the car the movement of the pedals is always downwards; and this, combined with the fact that there are only two pedals, makes mistakes in driving practically impossible. With the ordinary arrangement of clutch pedal, accelerator pedal and brake pedal, even the best driver sometimes makes a mistake in a moment of anxiety.—Yours truly,

NEW ENGINE COMPANY.

## THE REPAIR OF TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I recently took off a pair of old tyre covers from the driving wheels of my 14-h.p. Brooke, which had done good service, and being tempted by the low price, purchased a pair of new covers from a certain firm. The covers looked well but the rubber was evidently of the lowest grade, and from the fact that the receipted account bore a notice printed in smallest type on the extreme margin, "No guarantee given with rubber tyres," it was evident the firm had no confidence in their goods.

These covers began to unduly wear immediately, the so-called rubber seeming to melt away before the eye, and I had not run much over 200 miles—certainly not 300—before the canvas was exposed and the burst up occurred.

Complaint to the sellers was followed by their promise to consider the matter on receipt of the covers. On these being returned, they explained the tyres had been run on grass, and reckless driving of the car only could account for the disappearance of rubber from the treads. As a special favour and a concession under the circumstances they offered to pay me 7s. for the remains of the covers, and pointed out that the inner tube must have been weak and so caused the cover to burst. They add the information that in most cases the giving way of covers is due to the bad condition of the inner tubes—certainly an ingenious explanation.

I need hardly say I accepted with gratitude the magnificent offer for the remains of the rubber, feeling it was highly valued at that.

I have now invested in a pair of tyres by well-known makers, who

The Hon. Charles Weld Forester and Mrs. Forester on their 30-25-h.p. Brotherhood Car. The body, by Hamshaw, of Leicester, is of the "Leicester Phaeton" type, with detachable limousine top.

have a reputation to maintain, and can therefore not afford to put rubbish in their manufactures.

I would ask you to publish my letter as an experience which may be of some use to fellow motorists, and need only add that I am considered a careful driver and rarely use my brake, knowing the damage sustained by tyres therefrom.—Yours truly,

SM 140.

[We are afraid that the complaint of our correspondent with regard to second-hand covers is not an isolated one. It would often be well if intending buyers asked for references or some particulars with regard to the firms advertising covers abnormally cheap.]

## INEFFICIENT LUBRICATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was greatly interested in your remarks on this subject in a recent issue of the *M.C.J.* If any one thing more than another causes unsatisfactory service, it is imperfect lubrication. This is the case with many of the so-called careful drivers, who, having consideration for the car in not rushing it over all sorts of roads at high speed, cannot understand why the machine deteriorates rapidly. Often their education in the use of machinery has been confined to the maintenance and use of a horse-drawn carriage, in which an occasional greasing of the axles is sufficient, and they do not realise that the modern motor-car is really a road locomotive, rather than a horseless vehicle. There are many motor

traders who can recall instances of striking differences in the wearing qualities of cars of exactly the same model in the hands of different owners. One motorist will get satisfactory service throughout an entire season of continual use of a car, while another in the same neighbourhood, using his car less frequently, perhaps, will have frequent trouble and have to pay considerable sums for replacements and repairs. Usually the owner who has the bills to pay blames the manufacturer of the car, and never thinks that he himself is largely responsible for the difference in efficiency and durability.

Troubles with ignition or gears, or with carburation, for example, are attended to in season, because they are immediately manifested when the car is put in motion, whereas there is often no easily recognized symptom of defective lubrication. A seized piston or bearing is warning enough to the most inexperienced, but great damage may be done to mechanism that has just sufficient lubrication to keep it from seizing, but not enough to prevent destructive wear. Scrupulous attention should be given to lubrication to see that there is always an adequate supply of oil or grease in the proper receptacles, and that it gets to the point to be lubricated. Too liberal lubrication is merely wasteful, too little is destructive, and lubricants are cheaper than new machined parts.—Yours truly,

A COUNTRY GARAGE OWNER.

## A SLIPPING CLUTCH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The leather cone clutch on my small car has developed slipping tendencies. I should be glad if you would inform me the best treatment to obviate the trouble.—Yours truly,

CLUTCH.

[The best treatment for a slipping clutch is to first thoroughly wash the leather with paraffin to remove all the grease which may be on, and afterwards dust with a little French chalk or fuller's earth. An occasional dressing with equal parts of castor oil and paraffin is beneficial.]

## TAIL LAMP TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Elwood, re tail lamp troubles, in the *M.C.J.* of the 22nd ult., I would advise him to get a 20th Century acetylene bicycle lamp; they seldom if ever go out, and show such a good light that you at once perceive if the light is out without getting down, and they are so constructed that you can turn them to hang any way you like.—Yours truly,

C. E. G. O'RORKE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to the letter of Mr. F. Elwood in the *M.C.J.* of the 22nd ult., I should like to draw his attention to the rear lamp which is called the Dependence, and the use of which I am sure would get over all his difficulties. I have had two of these lamps on two different cars, and have found them everything that could be desired. I do not remember either lamp ever going out, and they have never given me any trouble whatever. This lamp throws a beam of light on to the road so that the driver may know that his lamp is all right, and I have found this a great comfort. I may say that while the Dependence was being repaired at one time, after being damaged in an accident, I used another lamp, and on more than one occasion found on arriving home that the light had gone out.—Yours truly,

W. F. BRERETON.

## THE CONTROL OF THE ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Motoring is in its very early infancy. What is required in the way of improvements, and what will doubtless come in time, may be summed up as follows:—Roads constructed in conformity with the requirements of high-speed traffic, including the provision of footpaths, employment of dustless materials, removal of high hedges at cross-roads, improved regulations as to speed of vehicles and driving to the common danger, universal lighting, causing obstruction, straying cattle, dogs, and children, Government control of the roads; while, for the safety of all, greater attention should be paid to those motorists (the minority, not the majority) who drive recklessly in any manner whatsoever.—Yours truly,

H. WAYMOUTH PRANCE, A.I.E.E.

THE BARDON CAR.—A correspondent writes:—"Herring," who wishes to know where to obtain Bardon parts, should communicate with Messrs. Doran, Taggart and Co., of High Street, Putney."

FREEDOM FROM PUNCTURE.—Referring to the illustration given in our last issue of the Daimler car of Mr. E. P. Prestwich, which is said to have been driven 6,000 miles without tyre troubles of any sort, Mr. S. F. Edge writes that the statement appears contrary to the usual experience, and adds, "Could Mr. Prestwich be asked if he will definitely make a statement that the car on which he is shown has been driven 6,000 miles and he has never had any tyre troubles of any sort?"

## CLUBS AND ASSOCIATIONS.

## DERBY.

ON Saturday last the closing run of the present season of the Derby and District A.C. took place to Dovedale. Though this was the last event of the year, it was the first occasion on which the club had met purely for the purpose of a run, all the others being meetings for the holding of competitions, or at the invitation of various gentlemen who wished to entertain the members at their country residences.

The meeting place was at the Peveril Hotel, and shortly after 3 o'clock the cars commenced to arrive by various routes, and opportunity was taken to renew acquaintance with the Dale, some of the more energetic ascending Thorpe Cloud, the highest peak in the neighbourhood, from whence a beautiful view could be obtained of the surrounding scenery, whilst others strolled through the gardens. Tea was served at 4.30 at the hotel, and soon afterwards, in view of the waning daylight, the members commenced to disperse, with regret that the season was all too early ended and with hopes that next year would prove as interesting and as fortunate in the matter of weather as the present one has been. The afternoon was perfect from a motoring point of view and the Dale and its surroundings looked at their best.

Amongst those present were Messrs. C. T. Leech and A. R. Robot-ham, 18-h.p. Daimler; Mr. H. M. Clifford and Mrs. R. S. Clifford, 12-h.p. Richard-Brasier; Mr. and Mrs. Alfred Swingler, 30-h.p. Daimler; Mr. Arthur Harvey, 10-h.p. Alldays and Onions; Mr. and Mrs. Geo. B. Fletcher, 9-h.p. Mohawk; Mr. and Mrs. C. R. Hewitt and Messrs. Aspdin and Guilman, 8-10-h.p. Humber; Mr. Norman Sayer, 15-h.p. Serpollet; Mr. and Mrs. H. E. Currey, 9-h.p. Oldsmobile; Mr. and Mrs. R. A. Wragg, 12-h.p. Wol-eley; Mr. and Mrs. C. J. Allin, 8-10-h.p. Humber.

It is hoped that next year the Motor Union will, at the invitation of the Derbyshire Automobile Club, hold one of their provincial meetings in the county.

## THE SCOTTISH AUTOMOBILE CLUB.

The hill-climbing performance test on the ascent through Glen-croft to Rest-and-be-Thankful was successfully carried out on Saturday last by the Scottish Automobile Club. Full details of the test hill were given in our last issue. The following are the gradients;—

580 ft.	...	...	...	level.
615 ft.	...	...	...	1 in 62.
740 ft.	...	...	...	1 in 43.
600 ft.	...	...	...	1 in 18.
310 ft.	...	...	...	1 in 10.
500 ft.	...	...	...	1 in 13.
650 ft.	...	...	...	1 in 12.
340 ft.	...	...	...	1 in 9.
430 ft.	...	...	...	1 in 8.
515 ft.	...	...	...	1 in 7.

5,280 ft.

The following were the best times on the mile stretch:—

	Min.	sec.
Mr. Brooman White's 60-h.p. Mercedes	...	2 19
Mr. Thos. Shaw's 28-38-h.p. Ariel	...	3 1
Mr. W. Walker's 14-h.p. Germain	...	3 16 3-5
Mr. Hugh Kennedy's 15-h.p. Darracq	...	3 17 2-5
Mr. L. C. Seligmann's 24-h.p. Gladiator	...	3 17 2-5
Mr. Thomas Potter's 15-h.p. Darracq	...	3 22
Mr. Owen R. Williams' 15-h.p. Darracq	...	3 40
Mr. William Weir's 20-h.p. Darracq	...	3 41
Mr. A. Johnson Fergusson's 22-h.p. Crossley	...	3 51 4-5
Mr. James M. Wilson's 10-12-h.p. Humber	...	4 3
Mr. H. M. Napier's 20-32-h.p. Darracq	...	4 4 1-5
Mr. Ed. J. Thompson's 20-32-h.p. Darracq	...	4 8 4-5
Mr. F. C. Buchanan's 10-h.p. Humber	...	4 23 1-5
Mr. A. Hunter Crawford's 10-h.p. De Dion	...	4 54 1-5
Mr. John A. Peacock's 16-h.p. Chenard and Walcker	...	5 18
Mr. Alexander Mackenzie's 16-h.p. Albion	...	6 7

Mr. Napier's 20-32-h.p. Darracq was driven on common naphtha, costing about 4½d. per gallon.

Mr. Alex. Blair and Mr. A. G. Rennie officiated as timekeepers, and Mr. J. R. Nisbet as starter.

## COVENTRY MOTOR CLUB.

THIS club held a consumption trial for its motor-cycle section in connection with its closing run on Saturday last. A tenth of a gallon of Pratt's motor spirit was measured out to each motor-bicyclist, who had to travel along the London-road in the direction of Daventry, and was instructed to remain exactly where his petrol ran out. Pedalling

chains were removed but special tanks were permitted, and only spray carburettors allowed. The winner proved to be Mr. R. W. Ayton, who did twenty-two miles, or at the rate of 220 miles to the gallon, his machine being a 3-h.p. Rover. The second was Mr. F. E. Marshall on a 3-h.p. Triumph, his distance being sixteen miles, but it would probably have been further had he provided a special tank which he could have drained to the last drop. The same applies to the third man, Mr. H. N. Smith on a 3-h.p. Clarendon, who did 14½ miles. Mr. G. H. Spicer on a 3½-h.p. Riley did 13½ miles, whilst Mr. V. A. Holroyd did nine miles on a twin-cylinder 5-h.p. Vindec. The officials were conveyed by a 30-40-h.p. Daimler car kindly lent by the Daimler Motor Company.

## HERTFORDSHIRE COUNTY.

THE Hertfordshire County Automobile Club held its final fixture for the season on Saturday last, and all but two of the twenty-eight entrants faced the starter.

The hill selected, known as Durrants, runs from Two Waters to Leverstock Green, and was chosen principally for its road surface, and because it was well off the main road. On Saturday, however, the competitors and officials were hampered in their work by the continued passing of vehicles of all descriptions.

The motor-bicycle class was won by the Rev. A. J. McKinney on a 3½-h.p. Quadrant, Mr. J. S. Harwood, 3-h.p. Triumph, being second, and Mr. Wells, on a Vindec Special, third.

In the tri-car class Mr. Victor Riley was first with his 5-h.p. Riley, closely followed by Miss Seed, who drove a 6-h.p. Raleighette.

In the car section seventeen faced the starter and some very exciting contests were witnessed. The winner in this class was Mr.

Mr. W. G. James on the 3-10-h.p. Crypto Car.

Photo by]

[Mr. T. R. Marriott

G. H. Gray, who drove his 6-h.p. Rover. Mr. Gray also secured the cup presented by Mr. N. Micklem, K.C., M.P., for the best handicap performance in any class. Dr. Fisher on his 8-h.p. De Dion won the Humber vase, presented by Messrs. Humber, Ltd., for the best performance by a private owner who had had his car in his possession a stipulated period. Mr. Collier, 12-h.p. De Dion, was third.

The most sensational climb was that of Mr. Grigg, whose 35-h.p. Daimler made the fastest time in any class during the day. The perpetual use of the electric siren during the climb was an absolute necessity, and gave colour to the terrific pace the car made.

The thanks of the committee are due to a large number of voluntary helpers who kindly acted as signallers over a very bending course. Mr. C. McWhirter was the judge, Messrs. A. J. Salmon and W. Whittall clerks of the course, Mr. E. Webster clerk of the scales, Messrs. D. K. Hall and H. James starters, and Mr. T. Williams acted as secretary of the very successful meeting.

## THE CRYSTAL PALACE.

A HILL climb, promoted by the Crystal Palace Automobile Club, will take place on Capt. Kidd's Hill, Hartfield, East Grinstead, on Saturday, October 20th. In this contest only genuine touring cars will be eligible. Only petrol will be allowed as a fuel, and oxygen and other methods of increasing power will be strictly barred. The catalogues and entry forms are now in the printer's hands, and Mr. H. Hollands, the hon. secretary, 16, Anerley Grove, Norwood, S.E., will be glad to forward them to anyone interested.

## THE MOTOR UNION.

THE Motor Union have decided to celebrate the tenth anniversary of the coming into operation of the Motor Car Act of 1896 by holding their annual dinner on that date—the 14th November. The dinner will be held in London, and the Union have decided to invite a considerable number of representative mayors, chairmen of county councils, chief justices, county surveyors, and members of Parliament to meet the officers of the Union and its various affiliated clubs.

## MOTOR-CYCLE UNION OF IRELAND.

THE members of the Dublin section of the Motor Cycle Union of Ireland brought the season to a close on Saturday, at Portmarnock. W. Ladley, in the second heat of the mile handicap, covered the distance in 1 min. 24 sec., establishing a new Irish record. Mr. T. W. Murphy started, the handicaps were framed by Messrs. Walter Keating and W. H. Meredith, and the times were taken by Messrs. T. W. Murphy and C. O'Connell.

The results were as follows:—

## One Mile Novice Handicap.

R. Dewar, 3-h.p. Triumph, 10 sec., 1; J. Walshe, 2½-h.p. F.N., 20 sec., 2; E. Cannon, 2½-h.p. Minerva, 15 sec., 3; J. A. Armstrong, 3-h.p. Swallow, 15 sec., 4; won easily by five yards, a length between second and third. Time, 1 min. 34-2-5 sec.

## One Mile Members' Handicap.

Name.	Final.	Car.
1. J. G. Drury ...	...	3-h.p. Triumph.
2. J. A. Armstrong ...	...	3-h.p. Triumph.
3. C. G. H. Lewis...	...	2½-h.p. F.N.

W. Ladley, who finished first in the second heat, when he created a new Irish record, was disqualified for pedalling beyond the 50 yards flag, and did not go in the final.

Ten Miles Go-as-you-please, a handicap for the Shaw cup, presented to the Union by Mr. Hampden Shaw, C.E., vice-president, to be run over an out-and-home course of one mile each way. The cup to be won

The Promenade, Blackpool, on which the Races are to be held next week.

twice in succession before becoming the property of any individual holder.

Name.	Car.	Handicap.	Time.
		M. sec.	M. sec.
1. C. G. H. Lewis ...	2½-h.p. F.N.	45	16 17
2. C. B. Franklin ...	3-h.p. Triumph	55	16 35
3. J. G. Drury ...	3-h.p. Triumph	1 0	16 56
4. W. Ladley ...	8½-h.p. Morehampton	scratch	16 10
5. R. W. Howison ...	2½-h.p. F.N.	4 0	20 23
6. Dr. White ...	3½-h.p. Morehampton	15	16 54
7. R. Hurse ...	2-h.p. Morehampton	3 0	21 57
8. J. Walshe ...	2½-h.p. F.N.	3 0	20 35
9. J. A. Armstrong ...	3-h.p. Triumph	1 10	18 52

Also competed: W. H. Guilfoyle, 2½-h.p. Minerva, 1 min. 30 sec.; S. Black, 2½-h.p. Buchet, 3 min. Won easily. The cup now becomes the property of the winner.

## MOTOR CYCLING CLUB.

A COMPETITION of the Motor Cycling Club was held last Saturday in the grounds of "Lightwater," near Bagshot, by the invitation of Major-General Sir H. E. Colville. Subject to the confirmation of the committee, Mr. W. A. Sale is first in the bicycle class, with Mr. D. S. Baddeley second. In the passenger class, Mr. A. S. Wilson comes first, with Mr. R. G. Booth second.

ON Monday the North Wales A.C. held its last meet of the season at Baron Hill.

THE Blackheath A.C. is holding its final run of the season to-day (Saturday) to The Beacon, Westerham Hill, Kent.

## THE BLACKPOOL MEET.

As we mention in our Comments on page 651 the Blackpool Automobile Meeting will be held, the attempt to frustrate the welcome offered by the Corporation having failed in the Courts on Tuesday; and the preparations are now well forward, while the extension of the time for receiving entries should lead to a great accession of interest.

The Competitions Committee consists of Messrs. A. Huntley Walker (chairman), A. L. Parkinson, G. J. Nearing, H. Butcher, N. S. Taylor and J. Potter, with Messrs. A. Huntley Walker and J. Potter as joint hon. secretaries, assisted by Mr. N. S. Taylor. The latest date for the entries has now been postponed to Wednesday next, the 10th inst., and some of the regulations governing the meeting are of special interest. Cars entered in the various tourist events, with the exception of Nos. 7 and 22, must be of the regulation tourist type, furnished with efficient silencers, and must carry the full complement of passengers of the average weight of 150 lbs. Any car which has competed in a competition for racing cars since 1903 will be ineligible for the tourist events. The chassis price must be the maker's recognised chassis price, and must have appeared in a catalogue published previously to the 17th ult.

Any car which has competed in this year's Tourist Trophy Race will be allowed to compete at the Blackpool meeting fitted with the same body and wheels, but no car will be allowed to compete in the tourist events, in the class where four passengers must be carried, unless the same is equipped with a bona fide comfortable body. No body will be accepted which consists of two additional seats placed at the back. A special marshal will be appointed to examine all bodies fitted on touring cars previous to the same being marshalled at the post, and he will be given power to decide whether or not these conditions have been strictly carried out. Any body which is considered as a special racing body will not be allowed to compete—such as cannot be honestly described as a genuine touring body.

The programme for Friday next, the 12th inst., consists of fifteen events. For motor-cycles there will be two events, a standing mile handicap for touring cycles and a mile scratch race.

The events for touring cars are more numerous. Events 3, 4, 5 and 6 will be standing mile runs for cars the chassis price of which is not more than £300, £450, £650 and £900 respectively. Event 7 will be open to any touring car, petrol or steam, unrestricted as to price, and three prizes will be offered—a silver cup value £50, a silver cup and a gold medal.

Event 8 will be a standing mile race for any type of steam touring car and a silver cup and a gold medal are being offered.

As we mentioned last week, there will be a race for motor-cars carrying twenty-two passengers, and this event—No. 9—should prove a popular attraction.

Friday's programme will conclude with the racing car classes. Event No. 10 will be for racing cars not exceeding in weight 650 kilos; Event 11, for four-cylinder cars not exceeding 1,000 kilos in weight; Event 12, for racing cars of four, six, or eight cylinders not exceeding 1,000 kilos in weight; Events 13, 14, and 15 will be similar to 10, 11, and 12, with the exception that they will be run over the full mile instead of the kilometre, with a standing start in all six classes. In all these a £50 silver cup will be awarded.

Saturday's events will be mainly distinguished from those of the previous day by the flying starts that will be allowed. The programme will commence with two motor-cycle races and the Events 18, 19, 20, 21 will be flying kilometre races for touring cars the chassis price of which is not more than £300, £400, £650, and £900 respectively—all entries to be fitted with touring bodies and efficient silencers. In Event 22 any touring car may compete in racing trim.

Steam cars and motor-buses will again have their sections—Events 23 and 24, over the flying kilometre. In all the classes prizes of similar value to those for the Friday are being offered.

In the racing car events several special awards will be competed for. The "Guinness" cup will go to the racing car not exceeding 650 kilos which is first in Event 25; one cup of the Blackpool Motor Club is offered in Event 26 for four-cylinder racing cars up to 1,000 kilos in weight; the Corporation's £200 cup will be the award in Event 27, for four, six, or eight cylinder racing cars not exceeding in weight 1,000 kilos. All these sections from Nos. 16 to 27 are over the flying kilometre course. The meet will conclude with a standing mile handicap for racing cars not exceeding in weight 1,000 kilos; a standing mile handicap for cars belonging to members of the Blackpool and Fylde District Motor Club and the standing mile handicap for the £200 Darracq cup.

In addition a special silver cup will be presented to any competitor establishing new world's records. Altogether a most interesting two-days' racing is promised, and there is likely to be a record gathering of motorists at Blackpool next week end.

The Patrol Committee of the Automobile Association are making special arrangements for the protection of members driving to and from Blackpool during the race meeting. A long line of confidential agents ready and willing to render aid and give information already extends from London to Warrington, and from that point to Blackpool the road will be under the charge of a company of picked cyclist patrols to assist motorists.

## PUBLIC MOTOR SERVICES.

THE Bath Electric Tramways Company have consented to run a motor-bus service to Potterne, Lavington, Tilshead, Upavon, and Rushall, if the Corporation will provide free accommodation for three buses during the experimental stages. The surveyor has been asked by the Council to prepare an estimate.

THE London Power Omnibus Company are now running motor-buses from Oxford Circus to Brixton, via Westminster and Kennington.

MR. H. TUDOR THORNLEY, of 25, West Bute Street, Cardiff, who is promoting the Cardiff and District Motor Omnibus Company, primarily for the purpose of running motor-buses to the districts of Whitechurch, Llandaff, Taff's Well, Radyr, Llanishen, and Penarth, from St. Mary Street, Cardiff, attended before the Corporation Cabs Committee, but Councillor Kidd said he thought the matter was such a serious one that they ought to hold a special meeting on the subject, and this course was decided upon.

THE agitation against motor-omnibuses in the Manchester suburbs culminated on Monday afternoon in a deputation to the Hackney Carriages Sub-committee of the Watch Committee. It was headed by Judge Parry, who appeared, he said, for practically all the residents and ratepayers along the Stretford and Ladybarn omnibus route. As the law stood, he continued, the committee was not bound to grant licences to the company to run vehicles if there were proper grounds against them. The objections he made were that the type of omnibus was dangerous at corners; that they created dust and mud nuisances; that they were a serious danger to children and invalids; and that they tended to reduce the value of property along their course. The committee's decision will be given when the renewal of the licences will be applied for.

EWENS, the conductor of the motor-omnibus which was wrecked on Handcross Hill in July last, has just been discharged from the Sussex County Hospital, Brighton.

THE residents of Kilburn and Cricklewood main road and those in West End Lane are making indignant protests against the motor-bus. The Hampstead Borough Council is also considering its noise and vibration so far as they disturb that district.

## ROAD REPORTS.

KILMARNOCK.—The Kilmarnock District Committee of the County Council is advising that body to petition the Secretary for Scotland with a view to the reduction of the speed limit through the village of Fenwick to ten miles an hour.

BOGNOR.—The local authority are considering a proposal by their surveyor to make the roads in the town "waterproof," as a solution of the dust nuisance, and several districts are now being visited with that object in view.

LONDON.—Birdcage Walk is closed for repairs. The road between the Mall and Storey's Gate is also being attended to.

WREXHAM.—The Urban District Council are about to spend £550 in improving their roads.

EXPERIMENTS AT EPSOM.—At Epsom some tarring machines have been in operation on the road by arrangement between the Epsom Urban District Council and Messrs. Robert Johnston and Company, 45, Parliament Street, London, who are the concessionaires for Great Britain of Johnston's Lassally Road Binder. The machines consist of a steam boiler for the heating of coal tar, and a wheeled distributing tank, by means of which combination tar, heated to a temperature of 200 deg. Fahr., can be applied to a road at the rate of 2,500 square yards per hour, penetrating into the strata of road material to a depth of two inches in the case of a good, hard surface road, and three or four inches where the foundation is of a loose flint nature. As the tar cools and hardens in the interstices, it binds the road.

LINCOLNSHIRE.—The milestones in the Holland division have been receiving a course of correction from the county surveyors. Many in North Holland were totally undecipherable, and these have been re-dressed and lettered, or replaced by new ones, and guide-posts have also been set up. In South Holland, it was found necessary to alter the positions of several of the milestones, measurements proving that they were inaccurate.

WESTCLIFF-ON-SEA.—Dustroy Ltd. arranged an inspection of a road laid with Taafalt at Westcliff-on-Sea on Wednesday.

## AUTO-CYCLE CLUB.

THERE were fifty-eight entries in the Auto-Cycle Club's penalty run from Woodford on Saturday. The course was to the forty-second milestone from London, and the winner of the club prize was found in the Woolwich and District Motor Club with 73.9 points; the Walthamstow Motor Club obtained 70.11 points, the Essex Motor Club 69.16, and the West Essex Motor Club 63.7 points.

THE first paper of the winter season of the British Motor-Boat Club will be read before the members of the British Motor-Boat Club at the Craven Hotel, Charing Cross, S.W., on the 18th inst., by Lieut. Markham, on "Horse power—What it is—How it is measured."

## NEW COMPANIES REGISTERED.

THE NUTSFORD PATENT SPRING WHEEL COMPANY.—Capital of £500. Registered office: Main Street, Newmilns.

PARAGON MOTOR WORKS.—£5,040. London Road, King's Lynn.

NEW CROKER-BARNES.—£2,000. To take over the business of tool manufacturers and engineers recently carried on by the Croker-Barnes Tool Syndicate, Ltd. First directors, W. R. Biddell, E. C. Harvey and S. H. Croker.

EMPIRE GARAGE.—£5,000. To acquire the business of a motor garage proprietor carried on at Goldsmith Street, Nottingham, by Mr. H. H. Sansom. First directors are Messrs. H. H. Sansom, A. R. Atkey, and M. Ross Browne.

THE NORTHERN MOTOR COMPANY, LTD.—Capital, £10,000. To acquire as a going concern the business now carried on by the Northern Motor Company at Belfast. The directors are Messrs. Charles W. Henderson, Maynard Saitin, Robert Liddell, J. Price Thompson, and H. M. Barbour, all of Belfast. Registered office: 38, Chichester Street, Belfast.

THOMPSON'S MOTOR CAR COMPANY, LTD.—Capital, £5,000. To acquire the business of motor-car contractors and hirers carried on at Dublin and elsewhere by R. Woods, C. Thompson, and F. G. Thompson, under name of Charles Thompson and Company. The directors are Messrs. R. Wood, C. Thompson, and F. S. Thompson. Registered office: 41, Lower Sackville Street, Dublin.

ELECTRIC VEHICLES DEVELOPMENT COMPANY.—£1,000. First directors Messrs. H. B. Van Daalen, G. Bruffit, F. Griffiths, and H. F. L. Pilet. 149, Bishopsgate Street Without, E.C.

A Picnic Party on Roundhay Hill, near Devises, one of the highest points in Wiltshire. The road leading to this point is most precipitous and the surface extremely rough. The car shown in the illustration belongs to Mr. Charles Smith, hon. sec. of the North London Automobile Club, who has been informed that he is the only Motorist who has taken an automobile up the hill.

CENTAUR MOTOR AND ENGINEERING COMPANY.—£100. West Orchard, Coventry.

GROSVENOR ENGINEERING WORKS.—£5,000. To adopt an agreement with H. Beadle and E. T. Giles, and to carry on the business of engineers, electricians, &c. First directors Messrs. H. Beadle (chairman) and E. T. Giles. 20, Danvers Street, Chelsea, S.W.

## MOTOR-CAR ACCIDENTS.

THE Countess of Derby had a narrow escape from serious injury on Friday of last week, being thrown head foremost from a motor-car and rendered unconscious. She was travelling from Knowsley to Witherslack Hall in one of the Earl's motor-cars. As the car was descending Stonebridge Brow, near Broughton, on the Preston to Lancaster main road, and was about to pass a victoria, the chauffeur saw a motor-car dashing down the opposite hill, and, seeing that a collision was imminent, he at once turned the motor-car into the fence. Unfortunately, it struck a telegraph pole with great force, and Lady Derby was thrown headlong into the fence, while the chauffeur was pitched forward. The countess was found to have been badly shaken, but no bones were broken, and when she recovered consciousness she was taken in the victoria, which was driven by Mr. Rideal, J.P., of Preston, to Preston, and thence by train to Witherslack. Mr. Rideal complimented the chauffeur on his presence of mind, and said his action was the right one under the circumstances.

Two large motor-cars which were said to be racing along Manchester Road, Middle Hulton, near Bolton, came into collision and both were completely overturned. There were two passengers in each

car besides a driver, and all were flung out. The occupants were badly shaken, but escaped serious hurt.

DRIVING a cart without lights near Cromer, Edward Howes collided with a motor-car and was thrown on to the road, dying in hospital from his injuries. At the inquest Captain J. G. Duff, who was driving the motor-car, said he was going uphill at about fourteen or fifteen miles an hour, and was close to his side of the road. A police superintendent said he believed that Howes was dazzled by the motor-car lamps. A verdict of "Accidental death" was returned, the jury adding that they considered the motorist was driving too fast while passing the cart.

TRAVELLING at high speed round a sharp corner, a motor-car occupied by Dr. J. Lloyd, of Chirk, and a chauffeur, collided with a cyclist, crashed into the parapet of a bridge, and precipitated part of the masonry into the river below. The accident occurred on the Glynceiriog-road, in Denbighshire.

"CHILDREN should not be allowed to wander along highways at dangerous places. Chauffeurs could not be expected to look after machines and children," was the remark of the Horley coroner on Monday at the inquest on Harry Sargent, aged three, who was killed by a motor-car between Horley and Redhill on Saturday evening. The child was running across the road after an apple, and was run over, despite every effort of the chauffeur to avoid it. A verdict of "Accidental death" was returned.

ON Saturday afternoon, as Mr. Taylor, jun., accompanied by his mother and his two sisters, was driving a motor-car in the direction of South Shore, Blackpool, he tried to avoid a dog which was running across the road. The car swerved sharply towards the footpath, and whether the wheels caught the kerb or not is uncertain, but one of the tyres burst and the car toppled over. The occupants were thrown into the road. The driver escaped uninjured, but the glass screen in front of the driver was smashed, and Mrs. Taylor's face was badly cut. Her two daughters were also severely cut about the face by the flying glass.

#### POLICE TRAPS.

THERE is a measured distance on the Ipswich road at Colchester. For speeding there three motorists have just been fined at the local court.

THERE is a measured furlong in the Kennington Road, S.E., through which three motorists have just been led to the Lambeth Police Court.

THE Mayor of Harrogate has publicly declared in the police court that the local Bench are not in sympathy with police traps on quiet roads and in lonely places.

MIDWAY between Doncaster and Selby, at Eggborough, is a police trap, from which few motorists emerge without trouble.

P.S. WAGHORN is again busy superintending traps in the villages of Slaughtam Clayton and Newtimber. The district of Poling (Sussex) is also police infested.

THERE has been a measured quarter of a mile at Edgerton, near Huddersfield.

THERE is a frequently worked police trap in the Roundhay Road, Leeds.

AGAIN police activity is being displayed at Loampit Vale, Lewisham.

THE Automobile Association patrols were on the Brighton road on Sunday. A motor trap was apparently working on a straight piece of open country road between Kingswood and Reigate Hill.

THE measured mile at Lancing is again in full working order.

SUPERINTENDENT MARKS has been very watchful at Cobham of late.

#### THE STORAGE OF PETROL.

AT the Marlborough Street Police Court, the West End Motor Company, Ltd., have been summoned for keeping petroleum without a licence, their licence having lapsed owing to its conditions having been violated. Mr. Guttridge, supporting the summons on behalf of the London County Council, said that one of the conditions of the licence to store petrol was that only one vessel of it should be opened at a time, and then in the open air. A London County Council inspector, however, guided by a smell, found a boy with an open jar of petrol in the company's garage. The lad was cleaning a car with the petrol, and there were five pools of it on the ground. A representative of the company said he could only express great regret at the boy's action, which was a direct infringement of his orders. It was the only complaint the company had received in two years. Mr. Kennedy imposed a fine of 40s., with 23s. costs.

#### THE NOISE OF THE CAR.

BEFORE Hon. Sheriff-Substitute Wilson, in the Sheriff Court, a motor-car driver named Victor Wells, Lawers House, was charged with having on August 21st, on a piece of ground in front of Fisher's Hotel, Pitlochry, and adjoining the main road or street in Pitlochry, failed to stop the machinery of his car so far as was necessary for the prevention of noise, whereby a pair of horses yoked to a carriage, in charge of William M'Lean, Fisher's Hotel, were alarmed. Accused pleaded guilty, but in extenuation said that he was not aware that he was infringing the law. The man who was driving the horses never said anything to him about the noise. Mr. Jameson, Procurator-Fiscal, said that so far the statement made by accused was correct. The man who was in charge of the horses was coming round to

take up his position in front of the hotel door, but he could not get forward on account of accused standing there with his machinery making a considerable noise, which had the effect of frightening one of the horses. The head ostler, noticing that the horses were plunging and rearing, asked the accused to move on or stop his machinery, but he refused. The noise continued for about ten minutes. The Fiscal thought a man in his position ought to have known the law, or at any rate he must have known that the noise was a great nuisance to people and dangerous to traffic. There had been complaints about the excessive noise at this hotel from visitors, but he thought his Lordship might take into account that this was the first case of its kind, and not impose a severe sentence. The Hon. Sheriff-Substitute agreed with the latter remarks made by the Fiscal, and imposed a fine of £2.

#### TECHNICAL INSTRUCTION.

IN view of the rapidly growing importance of the automobile industry, and the necessity for thorough technical instruction for those engaged therein, the governing body of the Northampton Institute have arranged the following courses for the session 1906-7. The full course consists of lectures, drawing office work, laboratory work, and workshop practice, according to the following syllabuses, and those who are able to devote the necessary time to it are strongly recommended to take a full course. In no case will students be admitted to workshop practice without taking some other section of the full course. We give the syllabus of this instruction as a matter of interest for the directors of other technical institutes undertaking similar work as follows:—

*Fuels for automobile work.*—Petroleum, petrol, alcohol, &c.; heat value and testing for flash point, burning point, viscosity, &c.; cracking or fractional decomposition. Indicated horse-power of internal combustion motors and difficulty in ascertaining it accurately. Brake horse-power, mechanical efficiency, four-stroke and two-stroke cycles, vaporisation and carburation. The value of compression.

*Carburettors.*—Essentials in the design of a good carburettor; various types in use.

*Engines and details.*—Materials used for construction; single and multiple cylinders, various types of motors for cycles, light cars, heavy cars, and road vehicles generally; power, speed, weight, &c.; position of engine; cylinder and piston details, combustion and clearance chambers; cooling of cylinder, pistons and piston rods, connecting rods and crank shafts; body of engines and methods of attachment to cars, valves, lifts, regulation, &c.

*Ignition devices.*—High and low voltage; electro-magnetic induction, the induction coil and construction of trembler and non-trembler coils; magneto-ignition, primary batteries and small accumulators and testing; the wiring of one or more cylinders for high and low voltage.

*Silencers for exhaust.*

*Lubrication and lubricants.*

*Transmission gear and gearing.*—Chain drive, live axle, and cardan shaft drive; bevel and worm gearing; speed gearing of varying types. Steering gear. Friction clutches—cone, disc and expanding ring.

*The chassis.*—Frames and suspension springs; brakes, &c.; wheels; axles; tyres.

Steam cars and steam generators, fuels and special burners, and other auxiliaries necessary for complete vehicles.

#### CASES AGAINST MOTORISTS.

AT the Retford Borough Police Court, Albert Farnell, of Bradford, has been charged with driving a car at a speed dangerous to the public, and in a manner dangerous to the public, on the North Road, Retford. Inspector Hampson was on duty on the North Road about 10.20 in the morning of the 15th ult., when he saw a car coming towards him, numbered A.K. 57. The speed would be quite thirty miles per hour, and probably nearer forty. He did not time the car, but considered himself a good judge of speed. Defendant was sworn, and stated that he represented the Daimler Company in Bradford, and had driven every type of motor-car since they were first introduced into this country. He drove in the 1,000 miles trial. He had also driven in various hill-climbing competitions, and was probably one of the best drivers in England. On this particular day he was driving from Bedford to Nottingham, and was then going on to Melton Mowbray. He should say, when stopped by the constables, he was travelling from twenty to twenty-five miles an hour. There was absolutely nothing in the road, and there was no danger to anyone. For the defence Mr. Thomas submitted that no danger to the public had been proved, and therefore he had no case to answer. Danger did not consist in the actual speed of the car but in the conditions of the road and the traffic where the car was driven. Defendant was fined £5 and costs in each case. Mr. Thomas protested against two fines being inflicted for practically one offence. No evidence had been offered as to the manner in which the car was driven.

AT Broxton (Cheshire) Police Court, Samuel Corpe, 96, Hammer-smith Road, London, was fined £5 and costs for exceeding the speed limit along the Whitechurch road. The police trap extended over fourteen miles, constables being placed at intervals along the road. They stated that the defendant travelled from Tushington to Broxton at the rate of thirty-one miles an hour, and from Broxton to Rowton at the rate of thirty-five miles an hour. The rate of speed for the fourteen miles was thirty-two miles an hour.

AT the Shoreham Petty Sessions, on Monday, five motorists were fined sums ranging from £5 to £8 for exceeding the speed limit.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, OCTOBER 13, 1906.

[No. 397.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

WE are glad to learn that the Motor Union have decided to convene a representative conference to consider the Report of the Royal Commission on Motor Traffic and the proposals for further legislation and additional taxation in regard to motor-cars which have been made in various quarters. The conference will be held on

the afternoon of November 14th at the Hotel Great Central, Marylebone, N.W. The chairman and honorary secretary of all the provincial clubs affiliated to the Union—eighty in number—as well as the 125 honorary correspondents of the Union throughout the country, will be invited. A representative gathering will thus be secured, and a definite decision will probably be arrived at as to the attitude to be taken by the organised motorists of the United Kingdom towards the recommendations of the Royal Commission.

### Cases Against Motorists.

How motorists have contributed to the county funds, provided opportunity for the display of prejudice on the part of J.P.'s, and assisted the police to find a new recreation in lonely lanes and secluded roads, only those who have followed the reports of cases in the courts can adequately comprehend. Here and there special sittings are frequently held to dispose of unusually large batches of cases, while the clerks to the magistrates feel that something has gone awry when motorists are not among the defendants. With regard to the reports of cases, they so frequently contain repetitions of points fairly well known that latterly we have only dealt with those in which novel or knotty questions arise. It will be seen that this week we have revised our method of publication of legal cases, now dividing them according to the section of the Motor Car Act under which they occur. The policy, however, of dealing only with those involving points of general interest, those in which the penalties seem excessive, or where there seems good cause for prosecution, will be continued. Readers throughout the country are invited to keep us informed of any special cases occurring in their districts, should these happen to be outside the areas covered by our regular correspondents.

### Motor-Car Imports and Exports.

WITH the turn of August an easing off in the importation of foreign-built cars into this country is usually experienced, and September last, while showing an increase over the same month of last year, proved no exception to the rule. According to the returns now available no less than 408 cars, valued at £186,446, were imported during last month; parts were responsible for a further sum of £128,179, giving a combined total of £314,625, which compares with only £256,969 in September, 1905. As regards the imports during the first nine months of the current year, these have amounted to 4,821 cars, worth £2,009,533, and parts to the extent of £1,430,097, the

aggregate of £3,439,630 contrasting with only £2,698,251 in the first nine months of last year, or an increase of roundly £741,000. Turning now to the exports of British motor-cars and parts, these, during August, amounted to £89,506—the largest so far recorded in any one month. For the first nine months of 1906 the shipments comprised 829 cars, valued at £294,821, and parts estimated at £215,445, the total of £510,266 representing an increase of £216,702.

### Local Club Competitions.

AGAIN the question of the presence of trade competitors in local club competitions has cropped up, and Mr. Charles Jarrott suggests that club competitions should be confined to members of the organisation living within a twenty miles radius of headquarters, and that every car taking part in a club event should be the *bona-fide* property of the owner, who should have owned it for a certain period, say, one month, prior to the event. The day, he thinks, will possibly come when automobile sport will cease to exist, but at the present moment it answers a very useful purpose in stimulating interest amongst users, and while it is possible it should be fostered and encouraged in every proper way. Stringent laws should be devised to govern these events, and to assist the various provincial and local clubs, who have not had the same experience with competitions as the parent Club has had, as to the course to be adopted by them to secure fair treatment for their members in club events.

### Post Office Motor Vans.

THERE is little doubt that the Post Office has got beyond the experimental stage with regard to its motor-vans, and the leading officials have been convinced as to the efficiency of the services in which the automobile plays part. Within the last few weeks it has been decided to considerably extend the service, with the result that the railway companies may find a decrease in the amount of their Post Office work ere long. Motor mail vans are now running from London to Hastings, Brighton, Eastbourne, Redhill, Epsom, Epping, Romford, and Hitchin—to mention only those that have succeeded in the south. The time is rapidly coming when they will be almost universally employed.

### The Argyll's Ill Luck.

THE reply of the Argylls Motors, Ltd., to the letter of Mr. J. W. Orde with reference to the advertisement in which the Scotch car was mentioned as second in the Tourist Trophy race is so clear and satisfactory that it may be regarded as the last word on the subject. An authoritative statement of what really happened will be of general interest. In the third round, one of the sandbags was actually thrown over the side of the car owing to the excessive roughness of the road. This in itself was sufficient to disqualify the car under the rules of the race, and demonstrates the enormous hammering which the floor boards must have been subjected to. In the fourth round, when running without ballast, Mr. George had to change his gears at approxi-

mately the same places in climbing the mountain, and there was no obvious difference in the speed of his car. Tourist cars are not designed to carry sandbags and the public do not require them for this purpose. Obviously, had there been two passengers in the back seat, the Argyll might have finished second without any disqualification. The question, however, remains as to the desirability of securely fastening dead weight in future competitions. As things are Mr. A. Govan has suggested that he should be allowed to advertise "Argyll finished second, but was disqualified through floor boards breaking and losing ballast."

#### The Town Motor Carriage Competition.

THE Town Motor Carriage Competition, under the auspices of the Automobile Club, will be held on Monday next, at the Wolseley-Siddeley garage at York Street, Westminster. Visitors interested in the trial will be admitted, on presentation of card, to the gallery which runs round this large building. In this way the event will be in the fullest sense public, while at the same time the Club officials will be able to carry out their duties entirely without hindrance, no persons other than officials being allowed on the floor of the building. Last week we gave the entries in this competition, which has attracted nineteen makes of car

Mr. J. Percy Dean, on the Scout Car on which he finished ninth in the Tourist Trophy Race. As will be seen, the vehicle is fitted with an actual touring body.

#### Our Photographic Competition.

IN our next issue we hope to publish the photographs which gained the prizes in our recent Competition. Meanwhile it will be of interest to competitors to know that they have been awarded to Miss M. Davy, "Copyhold," Cuckfield, Sussex (first prize of one guinea) and Miss E. N. Fisher, of Steinhilme, Warlingham, and Mr. J. Southey, "Clovelly," St. Ronans Road, Southsea, to each of whom a prize of half a guinea will be sent.

#### Emancipation Day.

NOVEMBER 14th next, being the tenth anniversary of Motor Emancipation Day, will not be allowed to pass unrecognised. The celebration will be confined to the actual pioneers of the industry, with the exception of invitations to distinguished guests for the meeting at the Hotel Metropole, London, followed by a run to Reigate, and luncheon at the White Hart Hotel—as on November 14th, 1896. The afternoon will be left to the formation of impromptu parties, &c., and the return to London will be made at the general convenience of participants and guests. In the evening a dinner will take place. For the purpose of the present reference the term "pioneer" is held to

include the following:—(a) Those who rendered the industry service in obtaining the repeal of the prohibitory statutes, (b) those actually engaged in a reasonably responsible position in the design, construction or manufacture of motor-cars on or prior to November 14th, 1896; (c) those who were engaged (again in responsible positions) in journalism devoted to the movement; (d) those owning or driving motor-cars on or prior to November 14th, 1896; (e) those who actually participated in the run to Brighton on November 14th, 1896. Messrs. Charles Jarrott and C. M. R. Turrell are hon. secretaries of the organising committee.

#### Non-Skidding Devices.

THE coming of cooler days and longer nights heralds a period of wet and greasy roads in many towns where tram lines add to the worries and perplexities of the motorist. Many drivers, fearing the risks and dangers of sideslips, are already seeing that their non-skids are in good order, while the recent introduction of some new types is evidence of the makers' desire to supply the demand. It would be of service to motorists generally if those who have had experience of these devices would contribute some impressions to our Correspondence columns, which are always open to the practical side of motoring as well as the interesting or theoretical aspects of the industry.

#### Notice of Prosecution.

EVEN magistrates are beginning to recognise the imperfections of the present motor-car law, and we are glad that Dr. Wright, of Halifax, who was fined £3 and costs at Huddersfield for driving a motor-car at the rate of 26½ miles per hour, pointed out to the Bench the unfairness of police methods, inasmuch as, not having been stopped at the time of the alleged offence, he had no opportunity of making a defence. The chairman of the magistrates agreed with much that the doctor urged, and said that he and his colleagues were of opinion that some plan should be devised in cases of that kind where parties, having passed measured distances, should be notified that they had been timed. Motorists had no chance of defending themselves. This is one of the peculiarities of the position. Motorists charged under Section 1 of the Act have no time limit; apparently they can be served with summonses weeks after the incident alleged to have taken place. On the other hand, in the case of those entrapped in "police controls" notice of the intention to prosecute must be sent within twenty-one days. Even this is too long an interval, and when motorists are alleged to have committed an offence when at a distance from home, injustice may easily be perpetrated.

#### The Necessity for Watchfulness.

THE holiday season is nearly over, and the time for consideration of the Motor-car Commission's report by the motoring organisations cannot be far off. Already the highways leagues and other associations of an unfriendly nature are cogitating on the subject, and many of the councils are advising their M.P.s on the matter, while a conference of all the rural and urban authorities of Cheshire will be held at Chester on the 13th inst. to consider the report and to make representations thereon to Parliament. Each council is invited to send two members. This is the beginning of an important movement that is likely to spread throughout the country. Local clubs should watch the deliberations at these gatherings and be prepared to reply to their conclusions where necessary.

#### The Storage of Petrol.

INCITED thereto by recent accidents to persons who have been using petrol in drying and cleaning, the L.C.C. is now engaged in a vigorous campaign wherever petrol is stored, and, from what we hear, it is evident some lessons are to be taught the careless people who disregard rules and regulations. Unfortunately, in most cases which come before the courts—and

a goodly number are said to be on the way thither—the punishment falls, not upon the person directly responsible, but upon someone whose instructions have generally been disregarded. This is the unfortunate part of the matter; at the same time it should be sufficient warning to all who store petrol to take care that their assistants realise the dangers, and are prepared to avoid the risks incidental to the storage of that spirit.

#### Railway Traffic.

SCOTCH railway passenger traffic during the past season has not continued the progressive advance that delights those responsible for the management of the lines. The extraordinary increase in the number of motor-cars going north is the reason assigned for this by Sir David Stewart, the Chairman of the Great North of Scotland Railway Company. Before the

the five miles' distance that has sometimes been favoured in Hertfordshire is the longest recorded up to the present.

#### Progress in Australia.

WE learn from one of our correspondents in Australia that the Brisbane Municipal Council have decided to carry out a six months' street watering trial by means of motor vehicles, those of the Yorkshire Patent Steam Wagon Company having been selected for the purpose. If at the end of the period the scheme proves successful the vehicles will be purchased outright, and further developments made in other directions. Until about three months ago there were no bye-laws under which motor-cars could run on public roads in Queensland, so that progress has been somewhat delayed. Another obstacle that stands in the way of any great business being done is the

Miss Mercedes, after whom the Mercedes cars were named, at the wheel of Herr Dreher's 120-h.p. Mercedes car, which made the fastest time in the recent Hill Climbing Competition up the Semmering, near Vienna.

[Allgemeine Automobil Zeitung.]

shooting season commenced the number of automobiles that passed one signal-box on the way north averaged thirty per day, most of them from England. That means a shrinkage in the first-class traffic receipts, which Sir David hopes will find partial compensation from the good advertisement which these motor travellers are likely to give northern Scotland among their friends. In that way there is hope.

#### A 14-mile Trap

ARE police traps being lengthened? The question is suggested by the confession of the police in a Cheshire police court. A motorist was charged with exceeding the speed limit along the Whitchurch road. It was said that the police trap extended over fourteen miles, constables being placed at intervals along the road. This is a new form of trapping, and one that we have not yet experienced in the south, where

cheapness of horses, which are sold at prices ranging from £5 to £8. Then, too, there is the duty, which adds about 40 per cent. to their cost in the country of origin. There are, however, several active automobile organisations in the colony, and on the 1st ult. the Automobile Club of Australia held a hill-climb at Sydney, when a 10-12-h.p. Clement-Talbot car was first out of eighteen competitors, the driver being a lad—K. Winchcombe—only sixteen years of age.

THE Hutchinson tyre, the London agency for which is at 13, Maddox Street, W., is of the beaded edge type, the rubber and fabric employed being of particularly durable quality, combined with sound principles of construction. Users who have had them in use for some time have been able to testify as to their immunity to cuts and the consequence of riding over rough places.

## THE BLACKPOOL MEET.

**A**LTHOUGH so late in the season, the Blackpool Automobile Meet promises to be a success. The sensational reports which have been set afoot as to disputes between the local organisation and the central bodies may be dismissed. That these should have obtained credence in print is really surprising. Owing to the uncertainty that prevailed in consequence of the application for an injunction the A.C.G.B.I.'s authority could not be invoked till somewhat late, and then a special permit for the meeting to take place was accorded.

Tuesday, Midnight.

Although just now one of the busiest of men, Mr. Huntley Walker, the chairman of the Blackpool Motor Meet, granted an interview with a representative of the *M.C.J.* at the Hotel Metropole, Blackpool, this evening. He gave the assurance that no trouble whatever existed between the officials of the Meet and the Automobile Club in London. A slight difficulty had arisen with regard to the closing time for entries, but upon a representation being made from the Committee at Blackpool, the time had been extended to Tuesday midnight. Regarding the entries these had not all been entered up, but the number was consider-

Mr. A. Huntley Walker, President of the Blackpool Automobile Club, the organising body for the Blackpool Races, at the Wheel of his Darracq Car.

ably in excess of 300—far away the biggest entry in any motor meet yet held in this country. Mr. Walker was sanguine in anticipation of a most successful meet.

The entrance fees up to Tuesday morning amounted to £1,000, and an important decision arrived at at a meeting of the Executive on Monday night was that no part of the receipts from entrance fees, should be spent in any way to which the slightest objection could be taken, and that the necessary entertainment of officials and specially invited guests, &c., would be provided for by a fund voluntarily raised.

Among the principal drivers who will take part in the meet are Mr. A. Lee Guinness, with a 200-h.p. Darracq; Demogeot, who made the world's record for the mile in Florida, with a 120-h.p. Darracq; Gabriel, 120-h.p. De Dietrich; Messrs. Du Cros, 130-h.p. Mercedes; Pope, 110-h.p. Itala; Warwick Wright, 100-h.p. Darracq; Cecil Edge, 90-h.p. Napier; Baker, 120-h.p. Fiat; and Huntley Walker, 80-h.p. Darracq. Tessier, who holds important motor-cycle records, is also said to be a certain competitor, and in the motor-'bus section the following are entered:—Two Darracq-Serpollets, one Fiat, one Ryknield, one by the Lancashire Steam Co., and two Critchley-Norris vehicles.

Wednesday.

An important piece of news comes in the report that Wagner, who covered 297 miles in 290 minutes in America on Saturday, is a possible competitor. Had he sailed immediately after the great race such would have been possible, but his presence is certainly problematical, although assurances on the point were freely given yesterday.

Many powerful cars have already arrived, the hotels are filling, and local enthusiasm is being aroused to a high pitch of enthusiasm.

## MOTOR-BUSES AND THE PREVENTION OF SKIDDING.

**O**NE of the problems that is urgently awaiting a solution, in connection with the rapid adoption of motor-'buses, is that of preventing their tendency to skid on greasy roads. Hardly a week passes without some device having this object in view being brought to our notice, the latest being that which has been invented by Dr. Wallis, of Staines, and which is being introduced by Mr. T. H. Wright, of 29A, Charing Cross Road, London, W.C. The arrangement, which has been experimentally fitted to a Leyland 'bus, has this week been subjected to trials in London, and has, we understand, received the approval of the Scotland Yard authorities. The apparatus is of an exceedingly simple character. A light two-wheeled trailer, which is connected by a ball-and-socket joint to the casing of the differential, runs behind the centre of the back axle; a small cross-bar on the trailer is attached at each side by means of Bowden wires to two sand boxes under the seats inside the 'bus. When the vehicle skids, the trailer, being independent in its movements, remains in a normal position. The jerk on the attachments, however, opens a valve on the side where the skid occurs, causing a stream of sand to shoot out under one of the wheels, instantly arresting the skid. We went for a short trial run on Wednesday morning on the 'bus in quest of a "skiddy" road, but unfortunately did not meet with success. Dr. Wallis, however, informed us that on the previous day, when the roads were in a more greasy condition, the device fully proved its efficiency, and as a result several of the motor-'bus companies have already decided to give the device a trial.

A COMPANY has lately been formed at Fielding, New Zealand, to establish a service of motor-omnibuses in the town.

MESSRS. CHARLES WINN AND CO., St. Thomas Street, Birmingham, are making several specialities for motor-cars, including a patent mechanical oil distributor.

DOUGILL'S ENGINEERING, LTD., have sent us a photo of a Frick car they have recently built to the order of Mr. T. Palmer, of Leeds. The vehicle is of the standard short chassis double-cylinder type, with the exception of having a curved dashboard, which adds much to its appearance. The transmission mechanism is of the Frick friction type, which gives all speeds forward and reverse from zero to maximum, and a direct drive on any speed.

THE task of adjudicating upon the "Motor House" Tourist Prize competition proved no light one, owing to the many hundred entries from all parts of the United Kingdom as well as the Isle of Man. Curiously enough no single competitor selected the first three winners in the exact order of precedence in the race, so that there has been no claimant for the first prize of a 6-h.p. Clement car. Less than a score of competitors gave the correct winner, and only one the first and second in the official order of the finish, he being Mr. C. J. Webb, of Wandsworth Common, S.W., who gave the Rolls-Royce No. 4 as first, and Berliet No. 23 second. The third and fourth prizes were those awarded to competitors whose estimate of the miles per hour most nearly approached that made by the winning car—Miss M. Lloyd, Merton Road, Bootle, Liverpool, who gave 39½ miles per hour, and Mr. W. H. Roberts, Tyn-y-Coed, Church, Rhyl, whose estimate was 38½ miles per hour.

## THE VANDERBILT CUP RACE.

THE third annual contest for the Vanderbilt Cup was run off in the United States on Saturday last in the presence of a vast concourse of interested spectators. The course, which was located on Long Island, started and finished at a point near Mineola, whence the cars went east on the Jericho road, then north, and finally west and south until Mineola was again reached. The course measured 29.71 miles, and was covered ten times, giving a total of 297.1 miles, as against 283.2 miles in 1905. The eliminating contest for the American team was held on the 22nd ult., when the best time—5 h. 27 min. 45 sec.—was made by Tracy on a 90-h.p. Locomobile, the next two places being taken by Le Blon (Thomas) and Harding (Haynes). Although they did not finish, Lytle (Pope) and Christie (Christie) made the next best performances, and were selected to complete the team to represent the United States. Afterwards an objection was made to Lytle on the ground that his car was towed for some way during the trials, and after an inquiry he was disqualified, his place being taken by Lawwell on a 110-h.p. Frayer-Miller.

## THE COMPETITORS AND ORDER OF STARTING.

No.	Driver.	Car.	Country.
1.	Le Blon	115-h.p. Thomas	America

who did it in 28 min. 36 sec. Out of the seventeen competitors sixteen succeeded in completing the first round in the following order:—

Driver.	Car.	Time.
		M. S.
Wagner	Darracq	28 36
Jenatzy	Mercedes	30 2
Duray	De Dietrich	30 18
Lancia	F.I.A.T.	30 27
Nazzaro	F.I.A.T.	30 41
Clément	Clément-Bayard	31 21
Shepard	Hotchkiss	32 20
Lawwell	Frayer-Miller	33 34
Christie	Christie	34 7
Luytgens	Mercedes	34 32
Cagno	Itala	35 17
Tracy	Locomobile	38 48
Heath	Panhard	39 50
Fabry	Itala	41 28
Harding	Haynes	45 18
Le Blon	Thomas	51 32

The only one who did not complete the lap was Weilschott, who lost control of his Fiat at one of the curves. The car plunged down an embankment, through a fence, and dashed among the onlookers. A boy was thrown a distance of twenty feet and two other spectators are reported to have been injured. Weilschott and his mechanic were rendered unconscious.

The Eliminating Contest for the American Vanderbilt Cup Team.—Lawwell on the Frayer-Miller Car at Krug's Corner.

2.	Heath	120-h.p. Panhard	France
3.	Jenatzy	120-h.p. Mercedes	Germany
4.	Lancia	120-h.p. F.I.A.T.	Italy
5.	F. Lawwell	110-h.p. Frayer-Miller	America
6.	E. F. Shepard	130-h.p. Hotchkiss	France
7.	Luytgens	120-h.p. Mercedes	Germany
8.	Nazzaro	120-h.p. F.I.A.T.	Italy
9.	Tracy	90-h.p. Locomobile	America
10.	Wagner	100-h.p. Darracq	France
12.	Cagno	120-h.p. Itala	Italy
14.	Harding	60-h.p. Haynes	America
15.	A. Clément	100-h.p. Clément-Bayard	France
16.	Weilschott	120-h.p. F.I.A.T.	Italy
17.	Christie	60-h.p. Christie	America
18.	Duray	120-h.p. De Dietrich	France
19.	Fabry	120-h.p. Itala	Italy

As will be seen from the table, there were seventeen competitors, No. 11, Foxhall-Keene on a Mercedes, withdrawing at the last moment, and the No. 13 not being allotted, it being deemed unlucky. The start was fixed for 6 a.m., but, owing to fog and a wet track, it was not till 6.30 that Le Blon was dispatched, the others following at minute intervals. Jenatzy was the first to complete the initial lap, his time for the circuit being 30 min. 2 sec., but this was easily eclipsed by Wagner,

Wagner maintained a terrific speed and completed the second round in 56 min. 22.5 sec., Lancia (Fiat) and Jenatzy (Mercedes) being second and third respectively. The position remained unchanged in the third round, which was completed by Wagner in 84 min. 19.5 sec. Fifteen competitors completed the fourth circuit Lawwell (Frayer-Miller) having retired owing to a collision with a cyclist. The order and times at this point were:—

Driver.	Car.	Time.
		H. M. S.
Wagner	Darracq	1 52 21
Lancia	F.I.A.T.	1 57 13
Jenatzy	Mercedes	1 57 32
Duray	De Dietrich	2 0 27
Clément	Clément-Bayard	2 1 54
Shepard	Hotchkiss	2 5 21
Cagno	Itala	2 17 18
Nazzaro	F.I.A.T.	2 21 29
Luytgens	Mercedes	2 22 4
Heath	Panhard	2 27 11
Christie	Christie	2 28 36
Le Blon	Thomas	2 30 9
Fabry	Itala	2 31 11
Tracy	Locomobile	2 34 9
Harding	Haynes	2 38 55

The positions of the leaders remained unchanged at the half distance, although Lancia, in his fifth round, made a great effort and gained nearly four minutes on Wagner, who was now leading by less than a minute. The times were:—Wagner, 2 h. 24 min. 30 sec.; Lancia, 2 h. 25 min. 20 sec.; Duray, 2 h. 28 min. 53 sec.; Jenatzy, 2 h. 32 min. 6 sec.; Clement, who had been delayed by tyre troubles, 2 h. 38 min. 26 sec.; Shepard, 2 h. 39 min. 14 sec.; Nazzaro, 2 h. 50 min. 50 sec.; Luytgens, 2 h. 54 min. 48 sec.; Cagno, 2 h. 55 min. 38 sec.; Heath, 3 h. 0 m. 40 sec.; and Fabry, 3 h. 5 min. It was in this round that the fastest lap of the day was made, the honour falling to Tracy, who on his Locomobile covered it in the remarkable time of 26 min. 21 sec. Considerable excitement prevailed in the sixth circuit, when Wagner overtook Lancia and Jenatzy, thus obtaining a substantial lead. The round was, however, marred by a serious accident. Shepard, while traversing the Jericho turnpike, was suddenly confronted by a man who had stepped across the road. The driver wrenched at his steering wheel and swung the car to one side, but it was impossible to avoid striking the unfortunate man, and he was hurled a considerable distance, death being almost instantaneous. Tracy, on the Locomobile, was also involved in an accident in this lap. The course, which had been treated with an anti-dust preparation, was, owing to the rain, in

Le'Blon on the Thomas Racer he drove in the Vanderbilt Cup Race.

a dangerous condition, with the result that Tracy's car slipped badly at one of the awkward corners and ran into some spectators, inflicting such injuries on a young man as to necessitate the amputation of both his legs. The differential gear of the car being broken, Tracy was forced to abandon.

In the seventh lap Wagner still led easily, with Lancia and Duray close up. The struggle was an exceedingly keen one, especially when in the ninth round Lancia passed Wagner, and eventually finished first. Wagner, however, started six minutes behind his Italian rival, and was consequently the winner, the result being as shown below:—

Driver.	Car.	Country.	H.	M.	S.
1. Wagner	... Darracq	... France	.. 4	50	10 2.5
2. Lancia	... F.I.A.T.	... Italy	... 4	53	28 4.5
3. Duray	... De Dietrich	... France	... 4	53	44
4. Clement	... Clement-B.	... France	... 5	1	59
5. Jenatzy	... Mercedes	... Germany	... 5	4	38

Owing to the public having swarmed on to the course to such an extent as to render it dangerous, the authorities stopped the race, although Le Blon, Heath, Harding, Nazzaro, Fabry, and Christie were still running. Cagno is reported to have retired because of a burst cylinder and Luytgens with a broken clutch. Wagner's speed works out at an average of about 61.4 miles per hour as against the 62 miles of Hemery last year, and the 52 miles achieved by Heath in 1904.

The subjoined table gives an analysis of the result of the race as regards the teams of the competing countries:—

	No. of cars which started.	No. of cars that finished.	No. of cars still running when race was officially stopped.	No. of cars which retired.
France	5	3	1	1
Italy	5	1	2	2
America	5	—	3	2
Germany	2	1	—	1

As will be seen from the foregoing description, the race was marred by a number of serious accidents, the majority of which were due to the spectators themselves, who, despite all efforts to prevent them, persisted in swarming on the course. The authorities had erected 8 ft. high wide-meshed wire netting on both sides of the roadway for a mile near the grand stand, through which a perfect view could be obtained, but the crowd tore away the obstruction so that they could stand on the road, putting their own lives in danger and hindering the racers.

As a result of the accidents a meeting has been held by the race authorities, when it was decided to abandon the Long Island course, owing to its proximity to New York, which permitted so many spectators to be present. It is estimated that over 200,000 people witnessed the race.

## THE FORD FOUR-CYLINDER CAR.

**A**FTER an unavoidable delay extending many months, the Central Motor Car Company, Ltd., of Long Acre, London, W.C., have at last received delivery of a number of the 15-h.p. four-cylinder two-seated cars which are now being turned out on a large scale by the Ford Motor Company, of Detroit, U.S.A. In view of the low price special interest attaches to the car from the point of view of the man of moderate means, who will now be able to enjoy the pleasures of riding behind a smooth-running multi-cylinder engine, from which he has hitherto been barred by the relatively high cost of four-cylinder vehicles. We gave an illustration and some brief particulars of the new car in the *M.C.J.* of February 24th last, but it may be of interest if we recapitulate the leading features. The frame is of pressed steel construction, the engine being located at the front end under a bonnet. The four cylinders are cast in two pairs, and the valves are all mechanically actuated off one cam shaft. A departure from the usual arrangement is found in the fact that the flywheel is fixed on the forward end of the crank shaft, its arms being formed to act as a fan in drawing a current of air through the radiator. The change-speed gear is of the planetary type, so largely used in American-built cars; it is arranged to give two speeds forward and a reverse, the drive on to the rear axle being through a cardan shaft and bevel gear. Two brakes are provided, both operated by pedals; the road wheels are 28 in. diameter, shod with 2½ in. tyres. The steering is controlled by an inclined hand wheel, and an unusual feature is the location of the reduction gear at the upper instead of the lower end of the column, the ease of adjustment being in this way, it is claimed, increased. Another noteworthy point is the suspension; at the rear the frame is supported on the axle by double-elliptical springs, and at the forward end by a semi-elliptical transverse spring, and we may add that three-point suspension is adopted, both for the engine and change speed mechanism. We had a short run on one of the new cars on Tuesday last, and were much struck with the flexibility of the engine, which is such that it is possible to crawl along on the top gear at a rate as slow as four miles per hour, the motor responding to the slightest touch of the throttle lever. Later on we hope to give the vehicle a long test in the country, when we shall be able to speak of its speed on the level as well as of its hill-climbing capabilities.

H.R.H. THE DUC DE MONTPENSIER has purchased the 130-h.p. De Dietrich racing car on which Gabriel was classed fifth in the recent Circuit des Ardennes.

## AN AUTOMOBILE SEARCHLIGHT.

WE are able this week to give an illustration of the Portable Motor Searchlight equipment built by Messrs. J. W. Brooke and Co., Ltd., Lowestoft, in the spring of the year to the order of the Tyne Division (Vol.) Royal Engineers. Since completion this outfit has been through severe trials, and has proved a distinct success, never yet having had a failure with the exception that in the first instance twin 3 in. tyres were fitted to the back wheels and had eventually to be altered to twin 5 in. During the naval manœuvres it rendered special service at Portsmouth and Stokes Bay, and was useful for field work at Salisbury during night attacks. Its usefulness has also been fully demonstrated at Aldershot, and it is now stationed at Clifford's Fort, North Shields, the headquarters of the Tyne Division of the Royal Engineers.

The chassis is built up of steel channels with the necessary cross members of the same dimensions. The wheelbase is 12 ft. and the track 4 ft. 8 in. The motive power is supplied by an 18-h.p. Brooke four-cylinder motor, with low tension magneto and high tension electric ignition, driving through a leather-faced cone clutch to a three-speed gear-box, giving twelve miles per hour on top speed. The generating dynamo developing 200 amps. at 80 volts is coupled direct to a 35-h.p. Brooke four-

General View of the Automobile Searchlight Plant built by Messrs. J. W. Brooke and Company, Ltd.

cylinder motor, also having duplicate ignition, and cooled by independent honeycomb radiator with large fan. The petrol supply is carried in two large circular tanks, one at each side of the car, and so arranged in duplicate, as is the whole outfit, that the light can be kept running and one tank filled whilst the other is in use. This duplication applies to accumulators, strainers, pressure valves, pressure pump, &c. The advantage of the two separate engines lies in the fact that whilst the generating motor can be adjusted, and when this engine is in operation any adjustment can, of course, be made to the propelling motor.

The projector itself is of the hand-fed type, 36 in. diameter—the largest size used—and a spare lens, as will be noticed, is carried in a frame between the dynamo and projector. Future outfits are being improved, inasmuch as the projector is being carried in a trailer that can be detached and got into otherwise inaccessible positions, the cable drum being carried on the main equipment, and in addition a distributing board is being arranged in order that two or three 18 in. projectors may be run instead of the one 36 in.

THE Albion Motor Car Company, Ltd., has received a repeat order from the Gareloch Motor Service Company, Ltd., for another 16-h.p. Albion char-a-banc.

## CONTINENTAL NOTES.

### Motoring Pilots.

The varying rules and regulations with regard to motoring which obtain in Switzerland are said to have given rise to a new occupation—that of guides or pilots to motorists, who station themselves at the customs-houses on the frontier and offer their services to visitors to point out the best roads, give intimation as to the local motor-car regulations, and to conduct the party to the places of note in the district.

### The French Motor-Car Industry.

At a meeting of the *Chambre Syndicale de l'Industrie Automobile* in Paris last week, it was announced that the exports of motor-cars from France during the eight months ending with August last had attained a value of £3,612,880, an increase of about £880,000 over the corresponding period of 1905.

### Public Services in Germany.

A proposal to establish a public motor-car service between Malchow, Rabel, and Teterow is at present under consideration. The Bavarian Government has approved the scheme for the starting of a motor-car service between Straubing and Stallwang. One has also lately been commenced between Lilienthal, Borgfeld and Horn.

### More Speed Trials in France.

*Les Sports* is organising a series of kilometre speed trials, both on a hill and on the level, for the 4th prox. The event will be held at Origny-Sainte-Benoite, about six miles from Sainte Quentin.

### A French Motor-Cycle Reliability Trial.

The Moto-cycle Club de France is organising a 1,000-kilometre motor-cycle reliability trial; the event is to be divided into three stages and will be run off on the 30th and 31st inst., and on the 1st November; classes will be provided for voiturettes, tri-cars, motor-bicycles having a cylinder capacity of one-third of a litre, and light motor-bicycles.

### Miscellaneous Items.

In order not to clash with the Gaillon hill-climb, the Auto-cycle Club de France has postponed its Grand Prix motor-cycle race from the 28th inst. to the 11th November.—The German military authorities are reported to be making a census of the motor-cars in the country which would be available in time of war.—A motor-car exhibition is to be held in Madrid in May next.—The *Alba Automobilwerke Gesellschaft* is the name of a company which has just been formed to establish a large motor-car factory at Trieste, Austria.

## THE LEON-DUSSEK 24-30-H.P. CAR.

WE are able this week to give an illustration of the 24-30-h.p. Leon-Dussek car which has recently been put on the British market by Motoria, of Hanover Square, London, W. The vehicle, which is of French construction, has a pressed steel frame, narrowed in front to increase the lock of the steering wheels. The engine, which comprises four separate cylinders 110 mm. bore by 130 mm. stroke, has the inlet and exhaust valves arranged on opposite sides, all being mechanically actuated. The mixture is furnished by a pressure-fed Krebs automatic carburettor, while two systems of high-tension ignition—magneto and accumulators—are provided. The water circulation is maintained by a gear-driven pump and a frame ribbed-tube radiator of a distinctive shape. A large belt-driven fan is also provided to draw a current of air through the radiator. The lower half of the crank case is so fitted that it may be detached to give access to the big ends, without disturbing the bearings in any way. Lubrication of the engine is maintained by pressure, any excess of oil in the base chamber being returned to the oil reservoir. The cone clutch is furnished with springs under the leather to allow the load to be taken up without shock. A double universally-jointed shaft connects the

## PETROL LEAKS AND THEIR DANGERS.

THERE is one point in connection with motor-cars to which too much care cannot be given; we refer to the possible development of petrol leaks, which are to be avoided not only on account of the loss of fuel, but because of the danger of fire which they involve. An occasional glance under the vehicle, when it is at rest, with the engine stopped and the petrol still turned on, may prove profitable. The fuel tank should also be inspected to see whether it has become leaky, through the opening of its seams by vibration, or whether the union connecting the pipe to the tank is leaking or not. The tanks of some of the cheaper classes of cars are made of galvanised iron. When this is the case, the drops of water which are almost inevitably taken in with the spirit remain upon the tank bottom and finally rust it through. When a leak due to this cause has developed, it is practically no use to solder it, as other holes will appear in a short time. It is better to discard the tank entirely and replace it by a strongly-made one of heavy-gauge copper. The petrol pipe should also be examined for leaks, and similarly the union which connects it to the carburettor float chamber. This pipe should have sufficient slack in it to prevent its being strained under any conditions, and may well comprise a coil, of

View of Chassis of Leon-Dussek 24-30-h.p. Car.

clutch with the gear-box, which latter is adapted to give four speeds and a reverse. The various gears are controlled by a single lever, which, while working in a "gate" quadrant, has a rocking instead of a sliding motion, by means of which the operation of changing gear is facilitated. The gear-box is of a relative large size, all the shafts within it running on ball bearings. In the car illustrated the final drive is by side chains, but it can also be supplied with cardan shaft transmission on to a live axle. The brakes are of the metal-to-metal type, the foot-controlled one contracting on a drum on the differential shaft, while those on the rear wheels, and operated by a hand lever, expand inside drums attached to the hubs. The car has a wheel base of 9 ft., so that any type of side-entrance body can be fitted.

We may add that two other sizes of the Leon-Dussek cars are being made—16-20-h.p. and 35-45-h.p. Both have four-cylinder engines, the dimensions of the former being 95 mm. by 120 mm. stroke, and of the latter 135 mm. by 140 mm., the normal speed being 1,000 revolutions per minute. In general arrangement they follow the lines adopted in the vehicle above described, and will well repay inspection at the hands of those seeking a reliable and well-built car at a reasonable price.

one or two turns, to render it flexible under the strains of service. It should not be so placed as to come in contact with any other part of the mechanism which might abrade it and in time cause a small hole. If any of the unions are found to leak they should be disconnected, the ground surfaces wiped perfectly clean and given a coating of white soap, which will be found to stop light leaks. If, however, this expedient is ineffectual, the bearing surface will have to be ground in with fine emery and rouge or whiting. Finally, we may add that the soldered connections of the petrol pipe to its unions will bear watching from time to time. If the precautions we have mentioned are taken, there should be little danger of fire due to petrol leakage, with the attendant risk of the destruction of one's car.

MR. WALTER GRAHAM, of Brixton, writes that "it is now about eighteen months ago since I purchased a 9-h.p. Jackson car, and I estimate that during that time I have done somewhere between 15,000 and 16,000 miles, failing once only through the accumulator running down. The engine is running now as well as ever, and the gear, which I have had taken out and cleaned, I find in perfect condition."

THE Woodstock Manufacturing Company, of Bristol Street, Birmingham, have been appointed agents for the Clyde cars in that city.

FOUR motor buses are being acquired from the Lancashire Steam Motor Company, Ltd., for the Todmorden Town Council. They are to be tyred by the Shrewsbury and Challiner Tyre Company, Ltd.

THE illustration reproduced herewith depicts the Heron car just supplied by the Heron Motor Co. to the Birmingham Corporation Fire Brigade, for inspection purposes and emergency work. The car is a special one throughout, and is both longer in the frame and wider than usual, in order to give

accommodation for a roomy tonneau. In fact, it is more like a wagonette, as there is room for three persons on each side, with ample knee space. The extra seats are removable, so converting the tonneau into an ordinary one, and affording accommodation for carrying gear, &c. Two hand fire extinguishers form part of the equipment. The engine is a 14-h.p. Aster, and the transmission through a strong gear-box, giving three speeds forward and reverse, to a cardan shaft and rear live axle.

MESSRS. A. C. CROWDER AND CO. have added facilities for the repair of tyres to their establishment in the Addington Road, Bow, E., where they are able to undertake repairs to cars, &c.

MESSRS. W. JESSOP AND SONS, LTD., are extending their premises at the Brightside Works, Sheffield, in order to cope with their increasing business, more particularly in crankshafts, axles and gear blanks.

MR. J. H. BELCHER is responsible for the curriculum of the Technical Institute, Coventry, where special classes in motor-car body construction and design have just been established, under the superintendence of Mr. W. M. Lovett.

MESSRS. ROGERSON, HORTON AND CO. have opened a new garage and repair shop in Egginton Street, Rochdale Road, Manchester, with accommodation for more than a score of cars and appliances for motor-car repairs of every description.

SIR J. HAMILTON GOULD-ADAMS, Lieutenant-Governor of the Orange River Colony, has just placed an order with Messrs. Jarrott and Letts, Ltd., for a 16-h.p. De Dietrich. The vehicle, which is to be sent out to the Orange River Colony, will be specially fitted up to meet Colonial conditions.

ACCORDING to the chairman of the Haywards Heath magistrates the Slaugham cross roads are the most dangerous in the county. In addition to the legal warning erected there, another has been put up by a private association, and it is to be hoped that these will not be disregarded by motorists going that way.

THE recent announcement of the General Petroleum Company, Ltd., that they are introducing a cheaper spirit, has created considerable interest. The necessity for more air, to the extent of 25 per cent., may be a drawback to many, but in this connection we may refer to the auxiliary air inlet recently introduced by the Bowden Patents Syndicate, Ltd. This device is inexpensive, can be fitted to any existing car or cycle, and enables the air supply to be increased almost to any extent at the option of the driver.

THE new sign of the Reo motors in Broad Sanctuary is now a feature of the great open space facing the Houses of Parliament and Westminster Abbey.

WE learn from Mr. Reginald Ward that in the course of a recent journey from London to Aix-le-Bains on his 16-20-h.p. Beeston Humber, it was only necessary to change speed once on the whole trip.

THE Daimler Motor Company has subscribed £100 towards the prize fund of the Blackpool Automobile races, and in addition are giving several special cups for competition among owners of Daimler cars.

SEVERAL drawings and photographs of representative types of British motor-wagons have lately been on exhibition at the office of the Director-General of Commercial Intelligence, Clive Street, Calcutta.

THE steam wagon which has lately been put in service to convey pottery between Hanley and Liverpool is a 6-ton standard machine constructed by Messrs. Alley and MacLellan, Ltd., of Polmadie, Glasgow.

"A SOAP is known by its lather" is the maxim with which Messrs. G. T. Riches and Co. have introduced Jergens' Pumiss Soap to our notice. This is made chiefly of pure vegetable oils and quickly effects its cleansing purpose.

A CORRESPONDENT at Moreton-in-Marsh writes that he has run his Iris car nearly 2,500 miles since it was delivered to him in the middle of July, and "it has been most satisfactory and regular in its running." He adds that the car is very easy on tyres.

THE accompanying illustration depicts Mrs. E. Kennard, of Market Harborough, and her latest motor-bicycle—a machine built by the Advance Motor Company, of Northampton. It is fitted with a 3-h.p. Advance engine, high-tension magneto igni-

Mrs. Kennard on her new Motor-Bicycle.

tion, spring forks, Bowden twisting handle to actuate throttle, &c. The machine was built specially to the order of Mrs. Kennard, who informs us that it is the only one of its predecessors which could be ridden at high speed without any whip or swaying.

FOUR of the first seven cars in the Tourist Trophy race used Price's Patent Candle Co.'s oils, and for the second year in succession the firm supplied oil for the winning car. The selection of this oil for the Rolls-Royce car was only made after an exhaustive series of experiments extending over several months before the race was run.

ITALA AUTOMOBILES, LTD., have lately supplied an 18-h.p. Itala car to Col. Sir Augustus FitzGeorge.

THERE is a motor garage at the rear of the Buckingham Hotel, Blackpool, for the convenience of visitors.

THE EARL OF DUNRAVEN has recently received delivery of a Crossley 40-h.p. touring car fitted with a handsome Roi des Belges body.

MR. R. VARLEY, of Lindfield, is advising the leading people of Sussex to convene public meetings in all the principal towns of the county to discuss the driving of motor-cars.

BRITISH manufacturers of motor-cars are invited by Mr. C. D. Bradford, the hon. secretary of the Natal Automobile Club, to send him catalogues of their latest machines.

A MOTORIST has been fined 40s. and costs at the Lambeth Police Court for failing, as the owner of a motor-car, to notify his change of residence to the London County Council.

AT the Northampton Institute, Clerkenwell, where Mr. D. G. Snodgrass is instructor in automobile design, opportunities are being given for students specialising in work connected with motor-cars.

LYTHAM, which is only seven miles from Blackpool along the coast, is keenly interested in the races, and Messrs. Williams Bros., the local motor firm, whose garage is in Henry Street, have laid in large stocks of accessories, tyres, &c., in view of the event. Their facilities for repairs are of a good order.

A NOVEL motor-bus was seen in Long Acre, W.C., the other day; it consisted of an ordinary horse-drawn bus, the front wheels and shafts of which had been replaced by an *avant train*, or motor fore-carriage. The engine is located under the bonnet, as usual, and transmits its power to the front road wheels, which act both as drivers and steerers.

MESSRS. NICKELLS AND CO., of Eastcombe Terrace, Blackheath, have just introduced an improved form of their

instantaneous valve connector for use on tyre inflators. As now made, the connection is made by simply squeezing a spring stirrup together, an air-tight joint being made by a small strip of rubber, which can be readily renewed. The device is not only simple and ingenious, but will be found a great time saver, as the operation of screwing on and off the usual connection is entirely obviated. Furthermore, no adapters are needed, as the Nickells connector, which is being stocked by Messrs. Brown Bros., Ltd., and the Lacre Motor Car Company, Ltd., fits any type of valve.

DURING the recent visit to Leeds of H.R.H. Princess Louise and the Duke of Argyll, the whole of the party were conveyed to and from the various official functions in motor-cars. Messrs. George and Jobling inform us that one of the vehicles—an Argyll—was in the works at Alexandria up to 9 p.m. on Friday, the 28th ult., and was running in the royal procession through Leeds at mid-day on the following Saturday.

ALTHOUGH it is now some time since the Gobron-Brillie British Motor Company, Ltd., removed from their New Bond Street address, they are still receiving letters re-directed from their old premises. Their address, however, is now 175, Piccadilly, W., where a large stock of Gobron-Brillie cars are always on view, for immediate delivery. It is their intention to carry a large stock of accessories and clothing, for which a special showroom is reserved.

IT has been decided not to hold a motor-cycle contest concurrently with the Dunlop Co.'s 1,000 Miles Reliability Motor Car contest to be held around Victoria in November. In the previous two reliability trials held between Melbourne and Sydney, the two events have been held over the same course at the same time, but the practice has not been too great a success, for whilst public attention was focussed on the doings of the cars the performances of the two-wheelers were overlooked. This fact, coupled with the lack of suitable accommodation at Hamilton and Stawell for a large body of motor-cyclists, in addition to the big motor-car contingent, has decided the company to run the 1,000 miles trial in November for motor-cars only.

MR. T. GIBBON BROOKS, of the Cardiff Motor Garage, has lately supplied a 32-h.p. Siddeley car to Sir W. T. Lewis.

THE Willesden Paper and Canvas Works, Ltd., of Willesden Junction, supplied the large scoring boards which proved so serviceable to those following the Tourist Trophy race.

FROM the Star Cycle Company, Ltd., Wolverhampton, comes a neat and attractive show-card of the Starling car, copies of which the firm will be glad to send to any motor-car agent.

MR. WALTER J. IDEN, who has had a lengthened experience in the construction of motor-cars, has been appointed to the position of chief designer by Messrs. Crossley Bros., Manchester.

A MOTOR fire-escape has lately been built for the London Fire Brigade by Messrs. John Morris and Sons, of Manchester. The chassis was supplied by the Belsize Motor and Engineering Company, it being of the Belsize standard 40-50-h.p. four-cylinder type.

OWING to the increase of their business the Vulcan Motor Company are largely extending their works at Southport. We also learn that they are bringing out a Vulcan 25-30-h.p. six-cylinder car for the 1907 season.

THE Chauffeur's Blue Book is a new publication of the Automobile Publishing Company intended to assist drivers in the many points that concern them—on the road, the car, and in the garage. Advice is also given with regard to questions likely to arise with the police, and the little work has much to commend it.

A DELIGHTFUL souvenir of Malvern, from whose hills can be seen the beacons of Brecknock, recently described in our columns, comes from the Belle Vue Hotel of Great Malvern. The convenience of the visitor is studied in the compilation of the handbook, as is demonstrated by the publication of a timetable of the motor-car service between the town and Malvern Wells.

ACHILL HEAD, in the Island of Achill, off the coast of Galway, has for the first time been climbed by a motor-car. Both the ascent and the descent are very dangerous, the narrow road being bordered by a precipice on the one side, and the surface of the track being terribly rough. The car which performed the feat was a 40-h.p. Martini landaulet with a party of five persons aboard.

MOTORISTS and horse owners have petitioned the Worcestershire police with reference to the injury done to tyres and to horses' feet by the presence in one of the Birmingham suburban roads of tacks and nails, which, it is believed, have been maliciously scattered about in consequence of the dust caused by motor-cars. Some time ago a petition complaining of the dust nuisance was presented to the local authority, but it was ruled out of order.

MR. HENRY MOORE, of Brighton, sends the result of his test of Moseley's perfect tyres as follows:—Weight of the car without passengers was 24½ cwt. Usually three, four, and five passengers were carried over almost every lane in Sussex. The distance run was 4,312 miles. He had four punctures only, and without great physical exertion was able to insert new tubes by the roadside. The tyres are still running, and will, he has no doubt, average 4,750 to 5,000 miles.

WE learn that the Caledonian Tyre Repairing Company, of 52, St. Enoch Square, Glasgow, have secured the agency for Mr. J. McConechy's patented corseting and fortified retread, the use of which is claimed to secure more resilience than usual, and to prevent the cracking or bursting of the walls of the tyre. It has a narrow ground contact, and throws up less dust than is ordinarily the case, acting as a repellant of road flints and not an absorbent. The corseting is fitted into the walls of the tyre cover, and the air tube when inflated presses on these semi-inextensible circumferential bands. They act as a fulcrum, throwing the air pressure on to the tread of the cover. Puncture is obviated because the thickest part of the tread is alone in ground contact. An Argyll car recently fitted with this corseting has lately demonstrated its merits, Mr. A. Govan testifying to the increased life of the tyre ensured by the adoption of this new device, which is put upon the market by the Caledonian Tyre Repairing Company.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
87-88, Charing Cross Road, W.C.]

### THE TOURIST TROPHY RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The Tourist Trophy Race now being finished, and the various competitors having aired their complaints, I would, with your permission, give an outsider's view of the whole competition and its want of utility. When I use the words "outsider's point of view" I wish to suggest that, never having taken part in this competition and never desiring to, I can view it with an unbiassed mind. The suggestion that the cars that were driven were of the ordinary type supplied by the makers is hardly correct, and the photographs of the vehicles themselves prove that, practically, very few of them are similar to the ordinary commercial article. As an education to the general motoring public the race is therefore useless from this point of view.

Why are these cars fitted with touring bodies to carry four people, when they only carry two people? What object is gained by it? What sense is there in having four seats when they are not filled? Why are all the competitors bound to carry the same weight? Surely, if one manufacturer can build lighter than his competitor he is entitled to the advantage and not the disadvantage of being handicapped to the level of the worst of the manufacturers. What sense is there in the limit of petrol consumption on the lines now taken? Surely, if a competitor can get round the course in half the time with one-third more petrol than is at present allowed, his performance would prove greater efficiency than the performance accomplished by this year's winner. By all means take petrol consumption into consideration—it is both a most useful and necessary part of such a competition—but do not limit it, simply use it as part of the formula.

Dealing with, in my opinion, the most important item of all, Is this race of any utility to the British industry? Being well acquainted with the methods of foreign manufacturers, I, without hesitation, suggest that it is harmful to the British industry, for it is used by foreign competitors as a means of arguing that the British cars are only raced at an average rate of forty miles an hour in the greatest competition organized by the British Club, and they put against it the speed attained by their own great cars in their own great races. It is very well for those in the motor industry, or those who take a great interest in motoring generally, to argue that one is a "touring race" and the other is a "sporting contest," but the general public do not go so deeply into the rules—which in fact, they never read—and they only compare the speeds. I venture to suggest that the triumph of French cars in the Vanderbilt Cup will do more to affect sales of French cars in America than the victory of Mr. Rolls, whom I congratulate, in the Tourist Trophy contest will do to affect British trade.

I feel sure that the authorities at the Automobile Club have the very best of intentions in promoting this race, but, viewed purely from a manufacturer's point of view, I consider it does more harm than good to the British industry. If we are going to have races in the Isle of Man, let them be races with one rule only: the first car in wins. With sensational performances much will be done which may startle the whole universe and help to make British motor products spoken of throughout the world. If we cannot have races in Great Britain, then I suggest that British manufacturers build British racing cars to compete abroad. France and Germany owe their present position to this and to nothing else. My firm, for one, will be building racing cars for next year's competitions, and outside that will take no part in any competition which is not of a sensational character, and in doing so we have one object only, and freely admit it, and that is sensational advertisement. If other British manufacturers would look at it in the same light, I believe greater strides would be made in obtaining a universal market for British products than is being done under the present system.—Yours truly,

D. M. WEIGEL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We note that Capt. H. H. P. Deasy suggests, as a modification of the rules for the Tourist Trophy Race, that the minimum chassis weight should "be increased to about 2,000 lbs., with a view to the fostering of a strong, serviceable type of car, suitable for ordinary touring conditions."

We cannot agree with this suggestion, as it is, in our opinion, not at all necessary that a chassis should weigh anything like 2,000 lbs. in order to be strong. If the finest material is used a car may be very strong and yet very light. The Tourist Trophy chassis which we entered this year weighs only about 1,600 lbs. complete with tyres. This chassis has proved that it is as strong as any made, by its splendid performance in the Liedekerke Cup, where the winner averaged about forty-nine miles an hour for about 268 miles, and where also our other two cars arrived without any defect whatever, and secured for this achievement the team prize. This proves decidedly that by using the best, and therefore the right material, a car may be light and yet strong, or even stronger than

a much heavier car, where generally the quality of material is replaced by quantity. In view of Capt. Deasy's suggestion it is interesting to note that out of the twenty-nine competitors in this year's race only five of the chassis weighed over 2,000 lbs., and of these none finished, three breaking down owing to mechanical defects, the other two for want of petrol, whilst amongst the fifteen cars weighing under 2,000 lbs. which did not finish only four did not arrive owing to mechanical trouble.

This shows that weight alone does not make a car "strong" and "serviceable" for touring purposes. Nearly every inquiry we get from owners, who have been motorists already for some time, is for a lighter chassis than what they have been using. This would look as if the public tendency was in the direction of lighter, not heavier, chassis. We think that it is much better to encourage a light and strong vehicle than a heavy, lumbering machine, in which the wear and tear is much heavier everywhere, and especially on the tyres. Moreover, a heavy chassis requires bigger tyres, which raise more dust on the road than smaller tyres, and this is a point-worthy of consideration alone, as everyone who has the motor movement truly at heart must recognise that anything which can be done to diminish the dust nuisance is for the benefit of that movement.—Yours truly,

METALLURGIQUE CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Looking at the table of weights of the cars in the Tourist Trophy Race I see that the average weight of the chassis in the last contest was greatly in excess of the minimum weight laid down in the Club rules. The object of the race is to develop an economical car both in construction and service. Now, with the minimum weight of chassis as low as 1,275 lbs. it defeats this object and tends to encourage useless

The Right Hon. Sir Henry Robinson, President of the Local Government Board for Ireland, at the wheel of his Argyll Car.

waste of money by drilling and cutting away every pound of material that is not absolutely necessary to complete the race. If the minimum chassis weight were raised from 1,275 to 1,600 lbs., and the load carried reduced from 1,125 to 1,000 lbs., it would encourage the evolution of a car of much more wholesome proportions.—Yours truly,

T. THORNYCROFT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that the Tourist Trophy Race is over, I should like, as one of the competitors, to express my due appreciation of the great courtesy of all the Automobile Club officials, and of the excellent way in which all the arrangements were made and carried out. The organization was undoubtedly deserving of high praise. There are some people who apparently consider it smart, and quite the correct thing, to find fault with the Club, and to condemn it in unmeasured language. I fail to see any justification for this hostile and unfair condemnation, and would strongly suggest that these critics should in future make adequate investigations before expressing such criticisms.

There is one suggestion I should like to make, and that is that the rules for next year's Tourist Trophy Race should be settled without delay, while the valuable experience obtained in this year's race is fresh in our minds.—Yours truly,

H. H. P. DEASY.

### PETROL CONSUMPTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A little table on page 648 of a recent issue of the *M.C.J.* is the "text" on which I do not wish to preach a sermon, but to make some comments and a suggestion.

Supposing an intending buyer of a car, noticing the increasing price of petrol, decided to make economy in fuel consumption a special point

in deciding his choice, surely the table referred to would be a puzzle rather than a help. Certainly it contains some very curious results of the trials, and these need explanation. Why, for instance, should one 8-h.p. De Dion require thirty-nine and another seventy-three ounces, while a 12-h.p. of the same make required only thirty-seven ounces? Again, we find two other cars of 12-h.p., both by good makers, and of these one consumed sixty-nine ounces, and the other only fifty-eight ounces, while an Argyll of the same h.p. comes last with seventy-seven ozs.? Seeing these differences, it would seem reasonable to suggest that in all such trials the type of carburettor should be mentioned, as well as the mode of control, whether automatic or not.—Yours truly,

A. S. L.

### LIABILITY RE DOG.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of threatened litigation, I should be extremely obliged if you would send me a copy of the issue of the *M.C.J.* which in the spring contained a report of a dog accident case at the Croydon County Court.

The judge, I believe, laid down that a motor-car has as much right on the highway as a dog, and he would not give a plaintiff any damages unless he showed that the dog was under proper control and that there was negligence on the part of the defendant.—Yours truly,

J. B. ROOKE.

[The case referred to was reported in our issue of April 28th last. A motor-car ran over a dog, and in the course of his summing up, the judge said that a motor-car had as much right to be on the highway as a dog had, and there was an obligation on the owner of a dog to see that it was properly trained and under proper control; otherwise he could not hold anybody liable for any damage that might come to it. He held that the owner of the dog had failed to establish his claim and gave judgment for the defending motorist with costs.]

The 28-h.p. Daimler Shooting Brake recently supplied to Mr. Asheton Smith. The vehicle has an 11 ft. wheelbase and the body work is of natural wood varnished.

### THE FREEDOM FROM PUNCTURE RECORD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On perusing the last issue of your always most interesting journal, I read, with some astonishment, Mr. S. F. Edge's—may I say—challenge to Mr. E. P. Prestwich's statement that he (the latter) had driven his Daimler car 6,000 miles without a puncture; for I could refer you and Mr. Edge to a gentleman-motorist who has driven 15,000 miles on Collier tyres without a puncture. I trust, in fairness to Mr. Prestwich, you will find space for this in the next issue of your valuable journal.—Yours truly,

MAGNA EST VERITAS, ET PRÆVALEBIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The paragraph re "Freedom from Punctures" appearing in your issue of the 6th inst. has just come to my notice. I have much pleasure in informing Mr. Edge that the performance referred to in your previous issue is quite correct. The 30-40-h.p. Daimler, as depicted, has carried me over 6,000 miles, and that without punctures, bursts, or tyres troubles of any sort. The front pair of tyres were remarkably well, and to my knowledge were never once pumped up, and have only just been replaced by a new pair. I only hope that the good luck attending me in 1906 may precede my wheel tracks in the season of 1907.—Yours truly,

E. P. PRESTWICH.

### STEAM CAR EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Medicus's" letter in your issue of the 29th ult. we daresay we have had as much experience of steam motor-cars as most people and we find them extremely useful. We have driven these cars for about three years, and we consider them thoroughly suitable for hilly country and bad roads. We have had practically no trouble with tyres. We can get steam up in ten minutes, and after stopping half-an-hour or an hour, in two minutes. The steam car is not so economical as a petrol car, as it consumes rather more petrol per mile, but the engine certainly lasts longer, as its speed is not nearly so great. Steam cars are not so difficult to keep in order as petrol vehicles, and they do not require anything like so much attention. We should think a 7 or 8 h.p. car would suit your correspondent's requirements perfectly well, but it would not go more than about twenty miles per hour on an average. The cars are driven by a single lever, so that there is not nearly the complication that there is in petrol cars.—Yours truly,

THE WATFORD ENGINEERING WORKS.

### CONTROLLING ENGINE SPEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In my car the governor commences to close the butterfly valve, which is placed in the mixture inlet pipe, as soon as the engine makes about 1,000 revolutions a minute, and by pressure on the foot accelerator this action of the governor is stopped and the revolutions may be increased to 1,200. I understand that on some cars the accelerator pedal is used for the opposite purpose—that is, to close the valve and thus slow the engine. Can you or any of your readers advise me which is the best method?—Yours truly,

S. C. G.

### THE BIAS OF JUDGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Whatever may be argued for or against motoring on the high road, there can be no question that the motor-car is at present legalised by Act of Parliament, and not only has a right to proper use of the roads but also a right to fair judgment in the courts of justice.

It is therefore with much uneasiness that one sees reports in the papers that show the judges to be so biassed against motorists that the evidence is not fairly considered. Personally I have lost confidence in at least one county court judge.

I was driving at night round a dangerous corner, keeping to my left carefully, at about seven miles an hour, when a pair-horse brewers' van coming in the opposite direction at about the same pace collided with my car. The collision occurred at the railway arch south of Godalming, and I was proceeding towards Portsmouth. The facts were not even disputed, the van was acknowledged to be on its wrong side, and it was cutting off some of the corner, as horses will do if permitted. My car occupied 11 ft. of the roadway, while the van took 19 ft. The road was 30 ft. wide, and the off wheels just came into collision. Yet the county court judge told me I had ample room to pass, and did not blame the other side at all.

I was the defendant. The brewers, knowing well the advantage they had in court against a motor-car, did not expect me to fight the case. An appeal would probably have wasted more money.—Yours truly,

W. GUISE TUCKER, Major-General.

### MOTORISTS AND INSURANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I noticed in your last week's issue a letter from Mr. Letts, re motorists and insurance. I can fully endorse all he says regarding insurance with a good company. I was unfortunate enough to break a front wheel of my car, which caused considerable damage to it. I left the car there, and came home by train, telephoned to a motor depot in Birkenhead to bring it home, also informing the Car and General Insurance Company (which company I was fortunately insured with) about the accident. In less than a week the company had sent me a cheque, covering damage to my car, long before the latter was ready.

I hold no brief for the company, but consider such promptness much to be commended, and ought to be widely known.—Yours truly,

R. BAINES.

### A PROTEST FROM AN OWNER OF HORSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A few weeks ago I was driving along a road little frequented by vehicular traffic, and there was no car or cart in sight. I admit I was in the middle of the road, where I had a perfect right to be. All at once I heard a motor horn sound behind. I immediately got out of the way, and a large motor-car came dashing by me, with the owner holding his fiat out to me, threatening me with a summons. Of course, I thought the man was not in his right mind.

However, when I got farther along the road, to my surprise, he had a constable, and was exclaiming that he was a magistrate, and wanted my name and address, as he was going to summon me for being all over

the road. The policeman, knowing me, did not stop me, nor did I stop, as I knew the policeman. However, when I saw the policeman again he gave me the man's address, and he really was a magistrate. I have been anxiously waiting to receive the summons, that I might know where I was wrong in jumping out of his way directly I heard his demands, but it has not arrived yet.

If we drive at half the pace of the motors we are charged with furious driving. Now every person has to fly out of their way, for they are really kings of the road. I pay £100 a year rates and taxes, and have, it seems, no right on the highway.—Yours truly,

F. KING.

### THE NEED FOR INSPECTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is one point which has not been mooted so far in newspaper correspondence, that is, the large increase there will be within a year or two of second-hand motor-cars. These will naturally fall into the possession of less wealthy and responsible people than the first owners, and if stringent rules are not now made and enforced, for inspection, &c., the danger and annoyance from the half-worn-out car will be much worse than the new cars at present in use.

The danger is from the driving of the inexperienced owner; therefore, it is more than ever requisite that the driver should be certified as competent and his car as fit for the road.—Yours truly,

WILLIAM HAYES.

### PROMPT REPAIRS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I bring to the notice of your readers the following instance of promptness, courtesy, and enterprise shown by a well-known British firm?

On Sunday, September 23rd, I started from London with a friend in a 28-36-h.p. Daimler, counting on getting to my destination, some 320 miles to the north, by six o'clock on Monday night. Passing through Hatfield I had the misfortune to smash my near front wheel owing to a bad side-slip. The car for the time being was rendered useless and things looked black. But, before beating an ignominious retreat to London and falling back upon the train, I determined to try headquarters, and telephoned through to Coventry, some seventy-five miles away, explaining my predicament. Within three hours of the dispatch of my message a car arrived upon the scene at Hatfield in charge of two skilled mechanics with a new wheel, which they promptly fitted to my car, thus enabling me to proceed upon my journey without any further delay, and complete a six' days tour, which I did without another hitch, the car behaving splendidly from start to finish in spite of the tremendous shock it had been subjected to.

I am sure you will agree with me that this display of business enterprise, combined with all that appeals to one's sporting sentiment, deserves to be brought before the notice of the motoring public.—Yours truly,

ALEX. C. SCRIMGEOUR.

### RE SUNDAY MOTORING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, Mr. T. Morison, seems to think that by far the greater number of Sunday motorists belong to the "very rich" class, an opinion which is not borne out by close scrutiny. Many people imagine when a four-seated car passes them that the owner must of necessity be a very wealthy man, a deduction which is entirely erroneous. Mr. Morison's contention apparently is that the roads are maintained primarily for the benefit of the cyclist and pedestrian, and that motorists are only allowed their use on sufferance, a contention which is a decided fallacy, as the roads are made and intended for all.

For a large number of motorists Sunday is the only possible time for a run into the country, and were this pleasure withdrawn they would immediately sell their cars. Hence the result of such an edict as your correspondent desires would fall heavily on the employees of motor manufacturers, as the output of motor-cars would materially decrease.

Another fact that should not be forgotten is this, that so long as the beanfeaster and the poor man with a propensity for alcoholic liquor takes his country airing on a Sunday, the blissful state of perfect peace and security so longed for by Mr. Morison will never be realised, a statement that can be easily verified by driving along one of the main thoroughfares out of London on a Sunday evening.

Looking at the question from a national point of view, I cannot perceive how this proposal can possibly be entertained. For a long while the political cry has been relief and comfort for the poor man; it is about time now that the man of moderate means came in for a little consideration, for which he has waited so long.—Yours truly,

VICTOR PEACH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the correspondence in your columns on a suggested tax on Sunday motoring, I ask all our motorists, was ever such a ridiculous suggestion sent to an automobile paper? Your correspondent, Mr. T. Morison, writes very well about all the Sunday pleasures of the clerk, artisan, and shopkeeper, but he, apparently, as he is not a

motorist, is too selfish to think of the pleasure of a man who is cooped up in an office all the week and wants a Sunday's refreshing breeze on an automobile or motor-bicycle. Surely we have enough to put up with in taxation, police summonses, &c., without an additional tax of any kind being put upon us, let alone for such an utterly absurd reason, as for motoring on Sundays. Your correspondent must be either an utterly selfish non-motorist, or a person who considers it wicked to enjoy one's self, no matter how harmlessly, on Sunday. As to it being "these rich motorists," this is the old spiteful designation of motorists, whether they be rich or poor, and it is the designation most generally used when the writer fails to find any sufficiently spiteful expression for motorists without having to expose the fact that he hates us.—Yours truly,

ALAN A. L. HICKMAN.

### COIL TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you could advise me as to the trouble I am experiencing with the coil of my 10-12-h.p. double-cylinder car. The coil seems to run down the accumulators quicker than it should. Also the platinum on the coil trembler burn away in a very short time.—Yours truly,

R. S. POTTER.

[Properly adjusted tremblers should show very little sparking at the platinum points. If excessive sparking occurs, it is either due to wear on the platinum, or the formation of points and hollows on the surfaces. If the blades are not properly adjusted, the coil will take too much current, causing excessive sparking, and exhausting the current in the accumulators sooner. To obtain a proper adjustment an ampere-meter should be connected in the battery circuit, and the tremblers adjusted until the best spark is obtained without an excessive current passing. The current should be about 1½ to 2 amperes if it is a good coil.]

The 18-h.p. Siddeley Shooting Brake supplied by the Wolseley Company to the Mackintosh of Mackintosh. The vehicle is finished in natural wood, a special feature being the detachable boxes for carrying guns in 1 perfect safety.

### VALVE POSITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that the 1907 designs will soon be making their appearance, the question as to the best location for the inlet and exhaust valves might, I think, be usefully discussed. Personally, I am strongly in favour of placing them in the cylinder heads—an arrangement which would appear to be particularly advantageous, both in respect to its advancement of the thermal action of the motor and mechanically. Theoretically, it serves the purpose of delivering the gases directly to the combustion chamber without diverting them from their course in any way. It permits the employment of a far simpler casting, and lends itself well to any of the various methods of cylinder construction, absolutely independent of the nature of the cooling system. It simplifies the contour of the combustion chamber, eliminating all stresses at the time of explosion except such as are normal to the walls, rides the cylinder of pockets and angles, and allows the clearance volume to be handled in terms of bore and stroke, which, not to mention the greater ease of calculation which it entails, greatly reduces the cost of construction. While the arrangement thus possesses a number of advantages, it has its drawbacks in that it must of necessity increase the total length of the cylinder, and also because of a certain natural awkwardness in operating the valves. To this end it is necessary to employ some form of rocking spindle, to use offset tappets, or to mount a cam shaft upon the heads, in order to obtain a direct movement for opening the valves. All three methods are in use, the first being the most common. The

whole question is an interesting one, especially to motor engineers, some of whom I hope will send you for publication their views on the subject.—Yours truly,

C. R. ANDERSON.

### THE DISTRIBUTION OF TAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be pleased if, through your journal, the Motor Union would give us any information regarding the proposed competition for the best mechanical appliance for the distribution of tar on the roads which was put forward at their meeting at Bath.—Yours truly,

F. DUDLEY.

### THE CONTROL OF THE ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The solution of this question will certainly not be advanced by intemperate partisan letters on either side. It seems that there are a few definite propositions which must be recognised before we can get any "forrader."

First, the great majority must see that, whilst we have the power to regulate matters so that we shall not be annoyed or deprived of our rights and privileges as users of the public highways, we cannot, in our own interests, talk about abolishing motor-cars or taxing them out of existence, &c. It is to be hoped that the time is not approaching when the majority will think that they are advancing their interests by acting tyrannically.

But still more is it necessary that the motoring fraternity should, to use the words of a motoring friend of mine, recognise, fully and unreservedly, that they are a well-nigh intolerable nuisance to the rest of the world. The nuisance can undoubtedly be mitigated, but if it is to be thoroughly and satisfactorily done it must be by means of the cordial co-operation of the motorists themselves, and that we shall not get until they recognise the proposition set out above, and cease lecturing us upon our ignorance, &c., and preaching about the greater safety of a car at twenty miles an hour as against a horse at ten. The safety is not much in evidence when one emerges from a side street and finds oneself within thirty yards of a motor tearing down the street at something nearer thirty miles an hour.

Motors are increasing daily, and it is absurd to suppose that the public are going to submit to having the streets of the great towns made unsafe, and the country roads destroyed, as far as pleasure is concerned, merely for the amusement of a small number of rich people. Motors have undoubtedly come to stay, but hardly under present conditions.—Yours truly,

CRCIL B. PALMER.

[Although probably motorists may not regard themselves as nuisances, we gladly print Mr. Palmer's letter as an instance of the temperate statement of the case against the automobilists, some of whom may reply.]

### WANTED, A SIMPLE CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one of those who has been interested in automobilism since 1896, and who started his career on a 3½-h.p. Benz car, I venture to express my opinion that motor-car builders are rapidly departing from simplicity in design and equipment. There does not seem to be any particular reason for this regrettable departure except the desire to give all that can be afforded for a stipulated amount of money. The simple car is the car of the future, as only a very few years will show, and the maker who will begin on the policy of extreme simplicity will have his reward in an ever increasing business and possibly small but satisfactory and steady profits. There are to-day cars on the market with so many complicated parts and numerous pieces as to not only bewilder the buyer and user but to make repairs more necessary and costly, thus placing the motor-vehicle outside the reach of the average man. Nearly all the things found on the modern car are undoubtedly of more or less convenience, but they are by no means absolutely necessary to the average man. The present day design of the motor-car does not tend toward extreme simplicity. The car with all the modern conveniences will always have its place with a share of the public, but it cannot be the car for the individual who, through force of circumstances, is compelled to be his own driver and mechanic. A man so situated wants a simple car—the simplest that can be made—and such a car will prove so popular as to bring sufficient credit and remuneration to its maker.—Yours truly,

R. CHADWICK.

### AUTOMATICALLY-CONTROLLED IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—From my experience of the automatic control of the ignition as fitted to a Brotherhood car, I can assure "J. R. C." that it gives the most satisfactory results in practice. I have run my car over 4,000 miles, the greater part having been on the Continent, and have never had a moment's trouble or difficulty with any part of the ignition system. The comfort of being able to dispense with hand control is obvious, and I consider that the manner in which the timing is con-

stantly varied automatically in ratio to the speed of the engine makes for the greatest possible efficiency.

The whole of the ignition arrangements on the Brotherhood car are so admirably devised and carried out that I should want a good deal of persuading before I changed for any of the magneto systems in vogue. I may add that the engine control by means of the sliding pedal is also a great source of comfort to the driver, whose hands are always free for steering and handling the side brakes, and whose attention is not diverted by having to operate various hand-moved levers.—Yours truly,

E. A. DE PASS.

### THE DUST NUISANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some considerable time ago the Automobile Club had trials with cars fitted in various ways to endeavour to find out what was best suited to minimise this trouble, when they found that cars which were clearest of obstructions underneath caused the least dust, yet in face of this manufacturers will still keep on introducing cars with a large petrol tank underneath at the back.

Even in the Tourist Race several cars were so fitted, and I think that manufacturers might give a little more attention to this question, and if the public when buying cars would taboo all such obstructions, a great deal would be done in effecting an improvement.

I have had a car with tank fitted underneath which was a terrible dust raiser even at fifteen miles per hour, but now I have removed it it does not raise half the dust at thirty miles per hour, whilst at twenty there is nothing to complain of.

Were it not for this dust nuisance I feel certain there would practically be no antipathy to motorists.—Yours truly,

A. FIELDING.

### LUBRICATON TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I recently changed to another kind of lubricating oil for the engine of my car, and since then I have been greatly troubled with overheating and by smoke from the exhaust. The new oil seems to give excellent results in every other respect, and was highly recommended to me by an experienced user, so I can hardly believe it is the sole cause of the imperfect working. I have tested the water circulation, and adjusted the ignition and the mixture, and I am certain there is nothing wrong with any of these. If you can give me any suggestion as to the cause of the trouble I shall be greatly obliged.—Yours truly,

W. HUNTINGDON.

[This seems to be another case in which the carbon deposit in the cylinder is playing the greater part in causing trouble. It is most essential that cylinders should be periodically cleaned or overheating is almost certain to occur. We should advise, as in other cases where everything appears to be in perfect order, the removal of the cylinders and the thorough cleaning of the heads. With reference to the smoke from exhaust, in all probability the oil that is now being used is thinner than previously used, allowing a greater quantity to pass into the crank case; this ought to be remedied by adjusting the lubricators somewhat.]

### A SYSTEM OF BRANDING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Although a motorist myself, and a keen one at that, I would gladly second any efforts towards the suppression of the motor hog, and with your permission will make the following suggestion. Instead of the present comparatively trifling fine, let the motorist after the first offence be limited to a speed of fifteen miles an hour, and indicate the same by a differently-coloured number plate. For the second offence, bring down his speed to twelve miles an hour, again altering the colour of his plate (at his own expense, of course), and should he exceed this limit reduce his speed to eight miles, and let the same be manifest to all users of the road by a larger plate with black numbers on a white ground, surrounded by a deep black border. The punishment in this case would be infinitely greater than a fine or even a short imprisonment in the second division. Matters such as changing cars and the alteration of the police trap calculations, &c., are mere details that could easily be arranged.

Referring to recent very lamentable accidents, why not make it illegal for a person, whether on foot or wheels, to run behind any moving vehicle? If this is impracticable, something might be done by teachers at public schools warning their pupils of the great danger of such a practice.—Yours truly,

GUILBERT PITMAN.

EXHAUST MOTOR WHISTLES.—Mr. A. Batchelor, who enquires for an exhaust operated motor whistle, is referred to the "Excelsior" supplied by Messrs. G. M. Monnet and Company, 9-15, Oxford Street, London, W.C.

HIGH-TENSION PLUGS FOR MAGNETO IGNITION.—F. T. writes:—"Could any reader tell me where I could get some sparking plugs marked E.K. for high-tension magneto ignition?"

M.

## CLUBS AND ASSOCIATIONS.

## AUTOMOBILE ASSOCIATION.

AMONG the 175 new members elected at the last meeting of the Automobile Association Executive Committee were the Duchess of Bedford, the Marquis of Linlithgow, the Marquis of Northampton, the Earl of Albemarle, the Earl of Cavan, Earl Compton, the Earl of Guildford, the Earl of Londesborough, Lord Stanley, Lord Ninian Stuart, Lady Bowyer, Sir Augustus FitzGeorge, Sir David Salomons, Mr. H. Beerbohm Tree and Mr. E. W. Hornung.

## ESSEX COUNTY.

A SUCCESSFUL hill-climbing contest was held by the Essex County Automobile Club, at Bottledown Hill, about one and a half miles from Billericay, on Saturday. The course in places was very loose, and provided a good test for the cars. There were two competitions, one a

and starting once, whilst the lady passenger held a glass of water, the lady arriving with most water in glass being the winner. A time limit of two minutes was imposed. Prize, silver-plated butter dish. First, Mrs. Phillpott, driver Mr. Phillpott, 6 h.p. Siddeley; second, Mrs. Pattison, driver Mr. Pattison, 8-h.p. Panhard; third, Mrs. Jones, driver Mr. H. Nixon, 6-h.p. Regal.

Egg and spoon race for motor-cycles, six entries, once round the track with spoon (holding egg) in mouth, standing start. Prize, silver-plated spoons and tongs in case. First, S. W. Phillpott, 1½-h.p. F.N. cycle; second, B. Pattison, 3½-h.p. Brown cycle; third, E. K. Davies, 3-h.p. Davy cycle.

Musical chairs, for tri-cars and motor-cars, ten entries; competitors drove slowly round track, and on electric gong stopping the lady passengers ran to chairs placed in the centre, there being one chair short each time. Prize, pair of silver-plated fish carvers in case. First, Mrs. Wylie, driver Mr. Wylie, 6-h.p. Wolseley car; second, Mrs. Phillpott, driver Mr. Phillpott, 6-h.p. Siddeley car; third, Mrs. Jones, driver Mr. H. Nixon, 6-h.p. Regal.

Quick lunch race, for motor-cycles, six entries; competitors had to ride round track, then, stopping and eating a biscuit, ride once round, pick up and light cigarette (two matches only allowed), ride once round, stop and drink lemonade from bottle, and ride to finish. Prize, silver-mounted biscuit box. First, G. Aldington, 2½-h.p. Kerry; second, E. Davies, 3-h.p. Davy motor-cycle; third, W. Holt, 3-h.p. Noble motor-cycle.

Potato race for cars, ten entries; competitors once round track

The Essex County Club's Hill-Climbing Competition near Billericay.—Mr. C. F. Hill's 20-h.p. Wolseley Car at the Starting Point.

handicap, which included a stopping test half way through the ascent, and the other a straightaway speed test.

The winner of the handicap was the Rev. E. T. Maw, 8-11-h.p. Panhard, Dr. Montague Tench, 12-16-h.p. Clement, being second. Other competitors were:—Mr. C. F. Hill, 20-h.p. Wolseley; Captain J. B. B. Newman, 30-h.p. Rochet-Schneider; Mr. J. S. Brown, 20-22-h.p. Brown; and Mr. Burnett Tabram, 12-h.p. Wolseley.

The speed test resulted in favour of Mr. E. A. Lewis, 24-40-h.p. Fiat, Mr. J. S. Brown, 20-22-h.p. Brown, being second. The silver cups were presented after tea, at the residence of Mr. Burnett Tabram.

## SOUTHERN MOTOR CLUB GYMKHANA.

THE above club held a very successful closing function for the season in the form of a gymkhana on Saturday in private grounds adjoining the main Ewell road at Cheam. There were eight events on the programme and sixty-nine entries. Although somewhat late in the season, the weather was all that could be desired, and this no doubt assisted in the very gratifying attendance, it being estimated that approximately 250 members and friends attended, a large muster being ladies. The officials were:—Judges, Messrs. A. Vickers, J. Stanbury, and H. Luff-Smith; starters, Messrs. H. Fenn and G. Connor; stewards, Messrs. Lloyd Davies, Phillpott, Belcher and W. L. Lorkin (hon. sec. of club); sports hon. sec., H. Jones. The events resulted as follows:—

Glass of water race for passenger motor-cycles and motor-cars, thirteen entries. Competitors had to drive once round track, stopping

dropping potatoes into eight flower-pots. Prize, cigarette case. First, H. Jones, 6-h.p. Wolseley, eight points; second, S. Phillpott, 6-h.p. Siddeley, seven points third; R. Russell, 5-h.p. Wolseley, six points.

Potato race for motor-cycles, seven entries. Competitors rode round track collecting potatoes from flower pots. Prize, silver-plated toast rack. First, E. Davies, 3-h.p. Davy; second, G. Aldington, 2½-h.p. Kerry; third, W. Phillpott, 1½-h.p. F.N. Winner won by seconds only.

Bomb race for cars and tri-cars, eleven entries. Competitors rode down centre of track and endeavoured to run down and burst all balloons placed at awkward positions. Prize, silver-plated cruet. First, J. C. Brodie, 3-h.p. tri-car, two bombs; second, S. Phillpott, 6-h.p. Siddeley, one bomb; third, T. Wylie, 6-h.p. Wolseley, one bomb.

Slow race for cars, six entries, once down track on top speed and reverse up track to finish. Prize, silver-plated jam dish. First, A. Aloof, 20-h.p. Minerva, slowest time; second, H. Jones, 6-h.p. Wolseley, second slowest time; third, T. Wylie, 6-h.p. Wolseley, third slowest time. Among the members and friends present were Mr. Worger (Humber), Mr. Nixon (De Dion), Mr. Duffin (Decauville), Mr. Russell (Wolseley), Mr. and Mrs. Wylie (Wolseley), Mr. and Mrs. Jones (Wolseley), Mr. C. Pattison (Panhard), Mr. and Mrs. Phillpott (Siddeley), Mr. Pratt (De Dion), Mr. and Mrs. Vickers (Rover), Mr. G. Hind (Humber), Mr. Aloof (Minerva), Mr. Billing (Humber), Mr. Luff-Smith (Siddeley), Mr. Sharp (Wolseley), Mr. Gutteridge (De Dion), Mr. Stanbury (Daimler), Mr. Newton (Panhard), Mr. Ward (Clement car), Mr. Alexander (Phoenix tri-car), Mr. Brodie (Noble tri-car), Mr. Holt (Nobleside-car), Mr. B. Pattison (Danville tri-car), Mr. Harding (tandem tri-car), Messrs. Belcher, Chapman, Aldington, Phillpott, Davies,

Pattison, White, arrived on motor-cycles, and last, but not least, Mr. Walsh, 2-h.p. Hay motor, solid tyres, variable speeds, acceleration by whip and controlled by straps.

The club has decided that intending members (ladies and gentlemen) may join now, and their subscription will carry on until the end of 1907. The hon. general secretary is Mr. W. L. Lorkin, 31, Rhodesia Road, Clapham, S.W.

#### LADIES' A.C.

THE members of the Ladies' Automobile Club of Great Britain and Ireland were so fortunate as to have most splendid weather for their first autumnal and last 1906 meet. This was by invitation of Lady Salomons, at Broomhills, Tunbridge Wells, on Thursday last week. There were about thirty of the members and their friends present and these spent a most enjoyable afternoon visiting Sir David's noted work rooms, stables and garage, as well as Lady Salomon's picture gallery, library and gardens. Among those motoring friends present were:—Mrs. and Miss Amsden, Mr. and Mrs. Buttemer, Mrs. T. B. Browne, Miss Hills, Mrs. Hartung, Mrs. Henry Edmunds, Miss Edmunds, Mrs. and Miss Litchfield, Mrs. Merryweather, Mrs. Wilson Noble, Mrs. Nightingale, Mrs. Manville, Mr. and Miss Pilcher, Mrs. Piggott and Miss d'Esterre-Hughes.

#### BLACKHEATH.

THE final run of the season took place on Saturday last, to the Beacon, Westerham Hill, Kent, when the club was favoured with perfect weather and a good attendance, amongst those present being Messrs. F. C. Allworth, F. T. Beadle, H. Beadle, L. Beadle, H. A. Cunis, A. Jackson, T. Marshall, and F. Thorne. After tea the challenge cup, given by Mr. Alex. Duckham, was presented to Mr. Marshall, also the first prize for the hill climb which took place in the summer.

#### LINCOLNSHIRE MOTOR CYCLE CLUB.

AT the first general meeting of this club at Lincoln, on Wednesday, the 3rd inst., Mr. A. W. Foster in the chair, it was announced that there were already seventy members. Local centres or branches are to be formed in various towns in the county. There will also be riders from the Lindsey, Kesteven, and Holland divisions, as well as riders from the country on the committee, so that there will be very complete representation. The first event will be a hill climb at North Carlton, near Lincoln, in a few weeks, and there will be lectures, entertainments, &c., during the winter, and competitions, meets, inter-club meets, &c., in the summer. The officials are: chairman, Mr. A. W. Foster; vice-chairman, Mr. Godfrey Lowe (hon. sec. Lincolnshire A.C.) hon. sec., Mr. G. J. Wilkinson, 18, York Avenue, Lincoln; treasurer, Mr. J. R. Halkes, and hon. solicitor, Mr. C. Nelson.

#### AUTO CYCLE.

UNDER the auspices of the Auto Cycle Club a consumption trial for all types of motor-cycles, a passenger motor-cycle trial, and the quarterly trial for all types of motor-cycles will take place on Saturday, the 20th inst., starting from Uxbridge at 9 a.m. over a course of 125 miles. The three competitions will be run simultaneously, but they will be kept quite distinct in making the awards.

#### MOTOR YACHT CLUB.

IN spite of the Enchantress having gone into winter commission and the weather having become considerably colder, members still seem to find a good deal to attract them to the club, as is evidenced by there having been a large tea party on board on Saturday last, and a dinner party on the next day. Several cabins are being kept ready for use, though it is necessary to give the steward notice. The launch no longer meets members at the Town Quay, but by a little study of time tables it will be found that by changing at St. Denys a train can in some cases be got on to Netley with only a short delay. The best method, however, is to take a fast train to Southampton West, and, if only a hand-bag is carried, to take a tram to the floating bridge and a cab from there to Netley hard, where, if notice is given, a boat will always be sent off to meet members.

THE Yorkshire A.C. will open the winter session with a smoking concert on November 9th, at the Hotel Metropole, Leeds, the provisional headquarters of the club.

THERE were fourteen competitors for the Herts Automobile Club's hill climb at Pegsdon Hill, near Hitchin, on Saturday. The winner was Dr. Day, on a 6-h.p. Rover, Mr. R. Lely, 18-h.p. Vauxhall, being second, and Mr. E. Blain, 12-h.p. Hallamshire, third.

#### ROAD REPORTS.

**HAILSHAM.**—On the Pound Field road, about 200 yards from Chalvington Cross, there is a very dangerous corner. Mr. T. Young, a neighbouring property owner, has offered the Hailsham Rural District Council a piece of land so that the corner may be taken off.

**TAALFALT.**—The inspection of the new stretch of road at Westcliff-on-Sea which has been prepared with Taalfalt by Dustroy, Ltd., and to which reference was made last week, was a great success. Although the preparation had been laid two years ago it has stood the test extremely well, and Taalfalt will evidently have to enter into the calculations of surveyors and others responsible for the maintenance of roads.

## CASES UNDER THE MOTOR-CAR ACT.

### SECTION 1.—RECKLESS DRIVING.

AT Bradford, Sydney Stansfield Dixon, the secretary of the local automobile club, was fined £10 and one guinea costs, and his licence endorsed, for driving a motor-car to the danger of the public. Several witnesses testified to a great rate of speed, and the defendant declared that if the car could do what the witnesses had said he would make a present of it to anybody who could prove it.

At Epping, H. T. Knight, of Plumstead, was fined £10 for riding a motor-bicycle to the danger of the public. A clergyman stated that the defendant was travelling at a rate of nearly twenty-five miles an hour, and after he passed the witness he knocked down and seriously injured a little child. The Bench said they strongly deprecated such a speed on the main roads. It was a dangerous practice which would have to be put down.

The county magistrates at Hyde were engaged for over seven hours on Monday in hearing the charge against Ernest Hennell, chauffeur, of Upper Wimpole Mews, Devonshire Street, London, of driving a motor-car at an excessive speed in Stalybridge Road, Mottram, on September 8th. A little girl named Kathleen Oliver was killed by the car that the defendant was driving. A great deal of evidence was called, the witnesses for the prosecution alone numbering twenty-three. The Glossop Borough Surveyor (Mr. Haynes), who saw the car immediately before it knocked the girl down, said its speed was "upwards of thirty miles an hour," up a gradient of 1 in 24. In the end the magistrates imposed a fine of £10 and costs, with five guineas for the prosecuting advocate's fee and 5s. for each of the twenty-three witnesses for the prosecution. Three previous convictions were reported against

Touring in Italy.—The City Hall, Piacenza.

the defendant. On behalf of the defendant Mr. Wharton gave notice of appeal.

### SECTION 3.—LICENSING.

At the Highgate Police Court, Walter Johnson, of Stroud Green, was summoned for not keeping a record of the name and address of a person driving one of his vehicles, and, further, for employing an unlicensed driver. Eric Wilmott, Charteris Road, Finsbury Park, was summoned for driving without a licence. Police-sergeant Martin stated he asked to see Wilmott's licence at Stroud Green, where he was riding a motor-bicycle, which collided with a bus. He produced several dilapidated pieces of paper which witness produced stuck on a sheet of foolscap. It formed part of a licence, and inquiries showed it was taken out at Coventry and had expired. Mr. Johnson had no entry in a register of the driver of the bicycle. Johnson was fined £4 and 12s. costs and Wilmott £2 and 6s. costs.

### SECTION 6.—STOPPING IN CASE OF ACCIDENT.

The Marquis of Tullibardine and Lord Kinnaird were witnesses in Dundee Sheriff Court for the defence of Hugh Roberts, motor-car driver to the Marquis, who was charged with having on the public road between Mylnefield Fens and Dundee, failed to stop a motor-car on the request of Thomas Stark, farmer, Newmill of Gray, who was in charge of a horse, and signalled for the purpose by putting up his hand. The Marquis of Tullibardine said he did not see Stark holding up his hand when the car was approaching, but the driver afterwards told him that he did so when it was too late to do anything. The car was travelling at the rate of five miles an hour when it passed the farmer and his horse. Sheriff-Principal Ferguson found the charge not proven.

This case illustrated the advantage of the Scotch law with regard to cases of doubt.

## SECTION 9.—THE SPEED LIMIT.

At a sitting of the Kingston-on-Thames county justices, on the 4th inst., for hearing cases against motorists of exceeding the legal speed limit on the Portsmouth road, between Esher and Cobham, and on the Cobham and Esher roads at Walton, fifteen defendants were dealt with, and the fines imposed in the fourteen cases, one being dismissed, totalled £73 19s. 6d., the penalties ranging from £10 to £2.

Joseph Sutcliffe, a motorist, who was summoned at Leeds for having driven his car at the rate of nearly twenty-five miles an hour, complained that the policeman's method of timing speed with a stop watch was unsatisfactory. The magistrate said that no one would dispute that wherever human agency was called into play there was always likely to be a certain margin of error. The actual observations made by two officers, with the aid of a stop watch, however, were far more likely to be correct than the defendant's mere guess at the speed. Allowing for a small margin of error, the defendant would still be well over the mark. Sutcliffe had not been served with a notice of prosecution as well as a summons, and on this technical point he was entitled to a dismissal. The case was accordingly dismissed.

At Hove County Police Court, on Monday, Alderman Henriques, after imposing penalties upon motorists for exceeding the speed limit, commented on the uselessness of fines. Some people, he said, apparently thought nothing of paying a £5 fine for a day's amusement. If, however, the Bench had power to suspend licences for two, three, or four months it would afford greater satisfaction to the Bench and the public. Fines of £4 and costs were imposed in a number of cases, the speeds varying from thirty-four to twenty-eight miles.

A batch of sixteen motorists were proceeded against at the Buckrose (East Riding) Sessions at Norton, Malton, on Saturday, the "capture" being the result of a trap set by the police on the road from Malton to Scarborough on September 9th and 16th, and the result of the hearing was the infliction of fines totalling over £53, besides the costs. The chief offence was for driving at a speed exceeding the limit of twenty miles per hour.

## NO LIGHT.

At Chichester, on Saturday, William Knibbs was summoned for driving a motor-car without a back light on 25th September. Defendant said he could only account for the light going out through a violent shaking on the road at Cosham. He was fined 5s. and 10s. costs. Defendant: It's cost me £2 to get down to the Court, and it was only an accident. The Mayor: If it had not been, the fine would have been much heavier.

A LONDON motorist has been fined 15s. and costs at Scarborough for giving a false name when summoned for having furiously driven a motor-car.

## THE ENGINEERING AND MACHINERY EXHIBITION.

THE Engineering and Machinery Exhibition at present being held at Olympia, London, W., is attracting considerable attention amongst engineers, and on the occasion of our visit last week we came across quite a number of representatives of motor-car manufacturers and agents. A particularly noteworthy feature of the Show is the large display of machine tools, the bulk of which is shown in operation, being operated by means of electric motors. This section is of especial interest to motor-car manufacturers and traders, as it includes a number of tools specially designed for the automobile industry. The exhibitors include Messrs. Churchill and Co., Messrs. Selig, Sonnenthal and Co., Messrs. Ludwig Lowe and Co., Messrs. Buck and Hickman, Messrs. Suchard and Schutte, Berlin, Messrs. Burton, Griffiths and Co., Messrs. Pfeil and Co., Messrs. Armstrong, Whitworth, Ltd., Messrs. Joshua Heap and Co., Ashton-under-Lyne, Messrs. J. Holroyd and Co., Milnrow, near Rochdale, Messrs. John Stirk and Sons, Halifax, Bateman's Machine Tool Company, Ltd., Leeds, and Messrs. Geo. Richards and Co., Ltd., Broadheath, near Manchester. The only automobile exhibit is that of Messrs. Savage Bros., Ltd., who are showing one of their 5-ton steam wagons, combined with which is a portable electric lighting plant. Samples of their wood-tired wheels for motor-wagons are also on view. Tangent Wheels, Ltd., Balham, have a display of their special wheels for commercial and public service vehicles, which is attracting considerable notice. The Albany Engineering Company are present with a range of their Albany rotary pumps, which are now largely used for water-circulating purposes on motor-cars. A novel form of circulating pump is also shown by the Positive Rotary Pumps, Ltd., of 23, Northumberland Avenue, London, W.C. The Hele-Shaw disc clutch, which is exhibited by the British Hele-Shaw Patent Clutch Company, is shown in a variety of forms, it being made for general engineering purposes as well as for motor-cars. Price's Patent Candle Company, Ltd., have a large stand, on which are shown samples of their various oils and greases, including those especially prepared for use on motor vehicles. Messrs. W. H. Wilcox and Company, Ltd., made a large display of miscellaneous engineers' supplies, including lubricators, oil and water circulating pumps, oils and greases. The Joseph Dixon Crucible Company have an interesting exhibit of their graphitic and graphitic lubricants, now so largely used for reducing friction. An ingenious dynamometer for measuring the horse-power developed by petrol motors is to be seen at the stand of Messrs. W. G. Walker and Co., of Westminster. The apparatus, which is of a simple character, has already been adopted by a number of

motor-car manufacturers. The Roe Steel Castings Company, of West Drayton, show a large range of castings made by their special process, included in which are a number of motor-car components. Specimens of steel for automobile purposes are also to be seen at the stands of Messrs. S. Osborn and Co., of Sheffield, Messrs. Willans and Robinson, and Messrs. Jones and Colver, Ltd., Sheffield. Roller bearings are shown by the Empire Roller Bearing Company, and by the Hyatt Roller Bearing Company, both of Westminster. Acetylene lamps and generators for motor-cars as well as for general lighting purposes are shown by the Thorn and Hoddle Acetylene Company, Ltd. Messrs. J. and E. Marx show the well-known Carlo cleaning and polishing cloths, while a new one is seen in the "Perfecta," exhibited by Messrs. Boardman Bros., of Manchester. The Standard Metal Engraving Company and Messrs. Weiubrenner and Co. each make an interesting display of name-plates for machine tools and motor-vehicles. Other exhibitors include Fastnut, Ltd., whose "Fastnut" washer, for securely holding nuts in place, is already favourably known in the automobile world, the "Autoloe" of the Autoloe Syndicate, Ltd., and the "Sparklet" tyre inflator lately introduced by Aerators, Ltd., and which is being marketed by the Parsons Non-skid Company. The Exhibition remains open until the 17th inst.

## PUBLIC MOTOR SERVICES.

THE motor-buses at Shanklin, Isle of Wight, continue to be largely patronised. The motor-buses will continue to run to the principal places of interest throughout the winter.

Motor-buses on the Taaft-treated road at Westcliff-on-Sea. (See page 686).

It is probable that a motor service will be instituted next summer between Dulverton and Lynmouth.

THE ratepayers of the parish of St. Bride, Fleet Street, London, have adopted a resolution calling the attention of the City Corporation to the noise made by motor-buses.

THE St. George's (Westminster) Board of Guardians have decided to petition the Home Secretary with a view to legislation regulating the noise of motor-omnibuses, &c. A report from the medical officer at the Fulham Infirmary stated that accurate medical work was impossible in the day time owing to the noise. We notice, too, that in Fleet Street, London, most of the newspaper office windows are kept closed nowadays.

MR. W. WORBY BEAUMONT believes that the horsed-omnibus will ultimately be displaced by the motor-omnibus on all the important roads in London and elsewhere, and that, too, within four or five years from the present time. This will mean the disappearance of the 3,000 horsed-omnibuses with which the public have been familiar. At the end of the present year the number running will probably be 800 or 850.

At the hearing of a summons for reckless driving against a motor-omnibus driver on Thursday week, at the West London Police Court, the defendant acknowledged that he did not know the rules of the road as to passing other vehicles, pleading as an excuse that he had only been driving one month. This ignorance and the consequent risk to the public was strongly commented upon by the magistrate. The incident serves to illustrate one of the principal "raisons d'être" of the A.C.G.B.I.'s driving certificate, as knowledge of the law, embracing rules

of the road, speed limits, meaning of signs, &c., is essential to the would-be possessor of the certificate.

THE agitation against motor-omnibuses in the Manchester district culminated on Monday in the refusal of the Hackney Coach Committee to recommend the renewal of the provisional licences to run the vehicles. The licences were granted to the Manchester District Motor Omnibus Company for three months, and they expire on the 16th inst. The opposition to the motor-omnibus came from the suburban townships of Manchester. Mr. D. Boyle, the managing director of the company, appeared before the committee on Monday, when a special report was considered. According to observations made on certain routes the passengers only averaged about four on each journey. Mr. Boyle said the omnibuses had carried 120,000 passengers, but recently there had been a sort of boycott. Experience had demonstrated, he said, that the single-deck omnibus was preferable, and he asked for the renewal of the licences on the undertaking that a more modern type of car would be put on the roads. Mr. Hall, the solicitor of the company, pointed out that a refusal to renew the licences would entail considerable loss on local people who had invested money in the company. The committee unanimously agreed not to recommend the licences for renewal. This decision is subject to the confirmation of the Manchester City Council.

GOOD help has been rendered to holiday makers during the season now closing by the vehicles of the London and South Coast Motor Service, Ltd., which have been running between Folkestone and Hythe, Canterbury, Hastings, Tunbridge Wells, Margate, Ramsgate, Broadstairs, &c.

### NEW COMPANIES REGISTERED.

VALIABLE COMPRESSION MOTOR SYNDICATE.—£3,000. No initial public issue.

PREMIER TAXAMETER COMPANY.—£100. Manufacturers of and dealers in taximeters and other appliances for registering fares, distances, or speeds, &c. No initial public issue. Registered without articles.

BANCROFT LOCK LEVER TYRE COMPANY.—£2,000. To acquire from Mr. H. Bancroft certain patents for improvements in detachable bands for attaching pneumatic tyres, wheels of motor-cars and other vehicles, &c. 70, Market Street, Church, Lancashire.

MOTOR CORPORATION.—£5,000. 19, Basinghall Street, E.C.

### MOTOR-CAR ACCIDENTS.

A SERIOUS accident has befallen Mr. Arthur Clifton, of Battle, who was cycling home from London, and, as far as can be ascertained, he was knocked down by a motor-car between Sevenoaks and Tonbridge. He was rendered unconscious, and whether the driver of the car alighted or not is unknown, but the young man was left lying senseless in the road. He was found in this helpless condition by another motorist, and conveyed in the latter's car to the nearest doctor, by whom he was medically attended. He is now in a very serious condition.

COLONEL FOX, chief officer of the London Salvage Corps, met with an accident on Saturday night while on his way to a fire. In response to an alarm from a factory at Bermondsey the corps turned out, and Colonel Fox, as is his custom, followed them in a motor vehicle. While sharply turning the corner of Southwark Bridge Road the off wheels rose from the ground, and although the car did not overturn, the chief officer was thrown out with considerable force. Colonel Fox is likely to be confined to his bed for some days to come.

### A QUESTION OF TRADE DISCOUNT.

AT Bow County Court, on Wednesday of last week, before Judge Smyly, K.C., De Dion Bouton, Ltd., brought an action to recover £5 8s. damages for misrepresentation from W. Bull and Co., of 38, Queen's Road, Plaistow. Mr. Tindal Atkinson stated that last November the defendant called at the company's premises and purchased a 6½-h.p. engine. He handed in a business card which read, "W. Bull and Co., cycle and motor manufacturers, 38, Queen's Road, Plaistow," and at his own request he was allowed the usual trade discount of 15 per cent., which amounted to £5 8s. on the price of the engine. It was not till some months later that it was brought to the notice of the plaintiffs that the defendant wanted the engine for his own car and not for trade purposes. The company then made further inquiries, and found that as a matter of fact Mr. Bull was a printer by trade, but when business was slack he bought and sold a few second-hand cycles. When questioned the defendant admitted that he had not sold the motor-car, and under all the circumstances the plaintiff company felt bound to take action for the recovery of this money, not only to safeguard themselves but the retail trade in general. A representative of the Collier Tyre Company stated that in 1903 the defendant purchased a pair of tyres from them. On the strength of the card he then presented he was allowed a trade discount of 15 per cent., and the same thing occurred in 1904. Defendant declared that he had "taken up general engineering" for the past eighteen years. He was self taught, and had mended printing machines, cycles, bedsteads and mangles. He bought the car in question when it was out of repair and repaired it with the help of another man in order to sell again. When he gave the order for the engine he did not ask for the trade dis-

count, and even if he did hand in the card it was not with the idea of misrepresentation. His Honour said the defendant had bought the engine for his own car and for his own purposes, and had obtained this discount of 15 per cent. when he was not really entitled to it. Judgment would be given for the plaintiffs for the amount claimed with costs on the higher scale.

### CLAIMS AGAINST MOTORISTS.

AT Marylebone, before Sir William Selfe, on Tuesday, Messrs. Charles Richards, Ltd., Paddington, jobmasters, sought to recover from Madame Reyntein, of Ovington Square, W., damages in respect of injury to a horse and brougham, said to have been caused by the negligence of defendant's chauffeur. Mr. Drury, plaintiffs' counsel, stated that one of plaintiffs' coachmen was driving Viscountess Monck, of Eaton Square, towards Kensington, when defendant's motor-car, without any warning, was driven straight across the road in the direction of Hans Road. The motor-car was going rapidly, and an accident was inevitable. Plaintiffs' horse was badly injured and the brougham was, practically speaking, smashed up. One of the wheels of the brougham was smashed, and had it not been for the coolness and determination of the driver the accident might have assumed a very much more serious character. The horse was prevented from bolting after it had collided with a tradesman's cart. The jury awarded plaintiffs £41 15s., and judgment was entered for that amount.

### POLICE TRAPS.

THERE is a trap all round Canterbury on the main roads, also at Sturry and Bridge.

A TRAP on the Portsmouth road between Ripley and Guildford has been unearthed by the Automobile Association's patrols and photographed.

POLICE traps are again being worked on the London road, Pyecombe, and at Poling—both in Sussex.

THE Dumbartonshire police have been recently very vigilant upon the Glasgow and Stirling road through the parish of Cumbernauld, between Mollinsburgh and Castleary, where there is a detached portion of that county. There are several measured distances between Condorrat and Eastfield and Cumbernauld, and between Cumbernauld and Castleary. No warning is given at the time, and the timing is done by men in plain clothes. Automobilists should exercise great care when driving in that district, which is under the jurisdiction of Sheriff Blair.

THE Chief Constable of Ayrshire has advised the Scottish Club secretary that a number of complaints have been made to him about excessive speeds on the Kilmarnock road, particularly between Fenwick and Kilmarnock, and has asked that the influence of the club might be used to ensure that any cause of complaint might be removed. Before making this communication the Chief Constable has taken the precaution of timing a large number of cars, and he states that he is satisfied that the complaints are well grounded.

THE meeting of the Cyclists' Touring Club to confirm, or otherwise, the proposal to enlarge the scope of that organisation's operations will be held on the 12th inst. at the Caxton Hall, Westminster.

THE Automobile Association's cyclist patrols will be on several roads in Lancashire during the Blackpool races. The cyclist company is being strengthened by a few of the smartest A. A. patrols in the southern district.

THE headquarters of the Blackpool Meet are at the Hotel Metropole; at the Clifton Hotel the Continental Tyre have established a depot and provided a staff of fitters in connection with the event.

MESSRS. J. C. AND J. FIELD, LTD., of Lambeth, are introducing some motor oils and greases of high grade. These are the result of careful experiment and should rapidly go into automobile favour. Among the specialities are "Fieldine"—this being the distinctive name of the motor preparations—motor oil, gear oil, and motor grease, all of which are supplied in rectangular tins of convenient capacity.

A NEW non-skid band known as the "Lac" Leather Non-Skid is being put upon the market by Messrs. R. S. Currie and Company, of 76, Salisbury Road, West Kilburn. This consists of a chrome leather band to which a band of belting is securely riveted by metal studs of somewhat different appearance to those that have become familiar. Mr. R. S. Currie is the engineer to the Ladies' Automobile Club and has well thought out the design of this new band, which has already elicited favourable commendation from those who have used the "Lac" device.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, OCTOBER 20, 1906.

[No. 398.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

THE first list of officers appointed to the Army Motor Reserve has appeared in the "London Gazette." With very few exceptions the officers of the late Motor Volunteer Corps have been granted commissions in the Army Motor Reserve. Captain Ker-Seymer and Captain Macmillan have received majorities, taking charge of administration in England and

Scotland respectively. It may also be noted that Lieutenant Windham, R.N., who held a majority in the Motor Volunteer Corps, now holds a captain's commission in the Army Motor Reserve, as his duties as King's messenger occupy so much of his time that he finds himself unable to accept the responsibility of a major's rank.

### Brighton.

BRIGHTON, the Biarritz of England, has ever been a favourite resort, and now that the Automobile Association scouts have made it possible to travel safely on the road thereto without being "held up," the weekly gatherings of motorists have become very large, as can be seen by the number of cars standing outside and round about the hotels. On both the last two Sundays this has been especially noticeable. At the Metropole, the rendezvous apparently of people from all parts of the world, the number of cars has certainly not fallen far short of one hundred, filling the garage, and extending in single line nearly to the top of the street adjoining, as well as standing three deep outside the hotel. The "Metropole," perhaps the best of all the Gordon hotels, is certainly one at which it is a pleasure to be a guest, the accommodation for motorists being especially good, roominess and airiness being the chief characteristics, although both are equalled by its cuisine.

### A Commissioner on the Report.

THE dinner of the Society of Motor Manufacturers and Traders at the Hotel Cecil, London, on Wednesday of last week, was notable as being the first occasion on which a member of the Royal Commission on Motor-Cars has spoken on that subject since the issue of the report. From the remarks made by the Marquis of Winchester, it was very clear that the Commissioners are anxious that the Government should place their propositions upon the Statute Book without any alteration from the form in which they have been given to the country. He paid warm tribute to the work of Viscount Selby in connection with the report, and also the enthusiasm with which Sir W. Forward, M.P., developed a technical knowledge of automobilism during the sitting of the Commission, bringing his ideas into line with those of the motoring community. He trusted that the views of the two official gentlemen who differed from their colleagues on the question of speed limit would have little weight with Parliament. The Marquis cordially approved of the appointment of a central authority to maintain the public roads of the country, and dealt very reasonably with the objection taken by the Royal Commission to

the fines paid by motorists being devoted to road repair and improvement. All along we have taken the view that such a policy was unwise, as making an innovatory distinction in the common law so far as motorists were concerned. There are many arguments in favour of advocating that taxes levied on users of the road should be applied to purposes of road improvement, but to suggest that fines for legal offences should be similarly allocated seems rather to put a premium on such exactions, and in practice would doubtless work out at a disadvantage to motorists.

### Mr. Stanley's Road Bill.

THE Hon. Arthur Stanley was given an occasion at the dinner referred to, to indicate the main provisions of the Bill which he is introducing with regard to the control of the highways. In his usual lucid manner he showed this would establish a Road Commission, somewhat on the lines of the Railway Commission, but responsible, of course, to the Local Government Board. Schemes of local road improvements would be laid before this body, whose enquiries would be directed to the need of such developments, and also to secure that new roads should be of sufficient width and suitable foundation to meet the needs of the traffic of the future as well as of the present. The proposed Road Commission would also endeavour to bring some kind of system into the management of the great arteries of the country. As a matter of fact, there are no fewer than seventy-two authorities responsible for the various parts of the Great North Road, and this naturally leads to confusion in control, and great lack of that uniformity in road construction desired by those who pass along its entire length. With regard to the proposed taxation Mr. Stanley was in agreement with all practical motorists that a tax on the basis of horse-power is the least scientific method that could be suggested.

### Practical Consideration.

A VERY practical speech was made by Mr. E. P. Hooley, the county surveyor for Nottinghamshire, who pointed out the absorbent power of granite, and dwelt upon the importance of road material being made waterproof on all sides before being laid on the road—a striking example of the value of which system can be seen in his county, where the roads are a delight to the user. Lord Montagu, who has done much good work in his own county of Hampshire, as well as in inciting local authorities elsewhere to road improvement, was able to touch upon the subject with knowledge of the financial aspect of the situation. This is the crux of the matter in several places, especially when we remember that the cost of road maintenance is increasing to-day at a very rapid rate. In Worcestershire, for instance, the cost per mile was £64 five years ago, now it is £86, and finality has not yet been reached. The suggestion was made by Lord Montagu, however, that the various localities should be encouraged to spend some settled amount upon road repair, the Government contributing an equal amount towards the cost. He is not altogether enamoured with the Commission's present suggestion with regard to the taxation by weight based upon the laden car, this appearing to place heavy touring vehicles built and equipped for reasonable use at the dis-

advantage of the higher powered but lighter vehicle built only for getting over the ground in the shortest possible time. Probably this is one of the subjects on which the Marquis of Winchester might be able to influence the framers of the new measure in order to secure that the basis of taxation might be the weight unladen, instead of insisting that this should be done when they are fitted with the tanks, &c., for the road. Other speakers at the dinner included Sir J. H. A. Macdonald, whose enthusiasm dates from the first 1,000 mile trial, Mr. Sidney Straker, the President of the Society, and Mr. Langridge, President of the Surveyors' Institute. Altogether the Society of Motor Manufacturers and Traders may be congratulated on the success of their initial meeting for the 1906-7 season, the speeches being pointed and clear, in place of that general roaming over the subject without indicating much in the end, which too often vitiates after-dinner oratory.

Motor 'Bus Racing at Blackpool. The Contest between the Critchley-Norris and the Leyland.

#### The Bench as Prosecutor.

AMONG the legal cases reported this week is one heard at the Cowbridge Police Court, in which the magistrates on the Bench appear to have been prosecutors as well; or, at least, one of them seems to have incited the police to prosecute in the first instance. On the 25th ult., after the business of the court had ended, Mr. Jenkins, from the Bench, asked the police superintendent why no steps had been taken to prosecute the driver of a motor-car who was alleged to have driven furiously through the town. The superintendent stated the matter was under consideration, whereupon Mr. Jenkins aid that unless the police took the matter up they would hear more about it. Hence the prosecution reported on another page.

#### Horse Power.

THE hope expressed by Mr. Sidney Straker on the occasion of the Press inspection of his new car on Monday with regard to the standardisation of horse power will be of interest to our readers. On several occasions leading makers have taken advantage of our correspondence columns to ventilate their views on the subject. Latterly the wonderful performances of cars of comparatively low power at race meetings and hill climbs have occasioned some surprise, the modesty of the manufacturers with regard to horse power being remarkable. Should the proposed

taxation by horse-power ever be seriously made further shrinkage with regard to the published attributes of their vehicles may be expected. Meanwhile, however, the vagaries of power will still amuse the trade and confuse the novice. However, Mr. Straker seems somewhat optimistic with regard to the joint efforts of the A.C.G.B.I. and the Society of which he is president in effecting some regulations which will tend to prevent cars being described as of 17-43-h.p.—or ranges of power equally wide and elastic.

#### Reigate welcomes Progress; but fines Motorists.

REALLY Reigate must look to the reputation it attained when, on the famous Motor Car Emancipation Day, it flung out a banner on the outward wall with the inscription that "Reigate welcomes progress," i.e., the motor-car. On Saturday last a batch of motorists assembled at the local police court, and all were fined save one. At first sight it would seem that there was a spark of sympathy on the Bench, but when the evidence is studied the wonder is that they should have expressed any doubt. It was obviously a case that warranted instant dismissal, despite the awesome presence of Inspector Jarrett, whose trapping propensities have given him renown throughout the county of Surrey. In the London Road, Kingswood, the inspector had a measured distance, and stationed himself at what he described as "the winning point." When questioned by the defendant Inspector Jarrett admitted that the measure was taken, not on a straight piece of road, but on a curve. He measured it with an eleven yards tape, taking the middle of the bend, which, he admitted, would make a difference of fifteen yards if the driver kept to the side of the road. The defendant said that he had measured the distance and found it 200 yards, not 220 yards, as stated by the inspector. If the car passed on the inside of the curve it would be twenty yards less. It was a most unfair trap, the distance being almost half a circle, and it was possible for anyone to go over the measured distance twenty yards less than the inspector said, and the loss of two seconds would make all the difference between being within and over the limit. Even Inspector Jarrett must be careful.

#### Industrial Alcohol.

THOSE who have lately taken a public interest in the question of industrial alcohol in its relation to automobile development will be glad to learn that the Society of Motor Manufacturers and Traders have appointed a sub-committee to consider the matter after consultation with any authorities likely to be able to assist in the matter. In view of this special attention may be drawn to the investigation which Prof. C. E. Lucke, of Columbia University, New York, is to make for the Department of Agriculture of the possibilities of alcohol as fuel. It is expected in the United States that large quantities of denatured alcohol will be used for that purpose in small engines, automobiles, and motor-boats, and the result of Prof. Lucke's experiments, as well as those which have been carried on in foreign countries, will be collected and published. Persons who have patented vapourisers, carburettors, or complete engines, which it is desired to test, may send the apparatus to Prof. Lucke at New York.

#### A Solicitor on the Law.

LAST week the Law Society met at Manchester, when "Motors and Highways" was the subject of a paper by Mr. W. E. Rowcliffe, who combines motoring enthusiasm with legal knowledge. Mr. Rowcliffe, having traced the course of legislation with regard to automobilism, ventured—and with truth—to think that many of the complaints raised against motorists are chiefly due to the dust nuisance. The public are well protected against the reckless drivers of motor-cars; but the motorist likely to be summoned for exceeding the

speed limit is at a decided disadvantage owing to the period of twenty-one days being granted to the police in which to give warning. And here we would remark that the mere call of an officer to intimate that it is the intention of the police to prosecute is not sufficient legal notice. Mr. Rowcliffe himself recently appeared for a client who had been thus notified, and was able to secure from the Bench a ruling to the effect that a constable could not be regarded as a "notice," the Motor Car Act of 1903 clearly intending that the intimation, if not given at the time of the offence, must be followed in writing. We agree with the criticism of the present law as to endorsement, which certainly requires all the amendment suggested by the Royal Commission. Altogether Mr. Rowcliffe's paper, though dealing with matters which have been learned by motorists in the police courts and elsewhere, must have proved highly useful and interesting to the legal audience to which it was read.

#### The Settlement of the T.T. Blunder.

OUR anticipations last week as to a satisfactory termination of the episode between the A.C.G.B.I. and the Argyll Co. has been realised, the latter having made written amend to the former, and the position assumed by the Club having been recognised as untenable in view of the official overlooking of Rule 29, which says that vehicles finishing the course—as was done by Mr. A. E. George's Argyll car—shall be driven to the enclosure under supervision to be re-weighed. "If after the race the weight of chassis and weight of load carried respectively are found not to conform to the regulations the car shall be disqualified." This rule should have been adhered to, and the times of the car taken, before disqualification consequent on the lost ballast took place. The incident proves the necessity of officials being fully conversant with the rules, and the advisability of fastening dead weight in competing cars. "All's well that ends well," and the Argylls are again doing well in automobile competitions with full official sanction.

#### In South Africa.

ON the Rand the motor-car is proving its serviceability to the managers of mines, metallurgists, and others in enabling them to maintain a personal touch with those responsible for various operations in mining. Throughout the Transvaal and the Rand the automobile is now used to visit the diamond and tin properties where formerly the post cart was the only means of conveyance. Several important agencies have already been given to local firms and others are pending. The Transvaal Motor Garage is the agent for the Darracq and Wolseley cars. At Johannesburg the Continental Motor Garage is erecting a motor garage at a cost of £7,000, the building being of steel, with a floor area of 150 ft. by 70 ft. This will be ready for occupation in December. The Motor Car Emporium and Messrs. Wevell Brothers are other firms interested in the import of automobiles into the mining districts, and they, in common with the others, find plenty of business of a rapidly expanding character. The inaugural run of the Natal Automobile Club was held recently, when seventeen cars were driven out to Mount Edgecombe from Durban.

#### Motor Cars in Bombay.

THE Government of Bombay now have under consideration the rules that are to govern the use of motor-cars in Bombay. It is practically certain the Government will adhere to their decision to impose a speed limit. As to what that limit should be the Indian journals are giving expression to a strong feeling entertained by the principal users of the streets that it should not be more than twelve miles an hour. There can be no modern city where the traffic conditions are more dangerous than they are in Bombay. The absence of pavements, the fondness of the people for the middle of the streets, the eccentricities of untrained coachmen, the multitude of slow-moving bullock carts in charge of slower-witted drivers—these

make up conditions, in a crowded city, which demand the utmost caution. They are intensified when the irresponsibility of a large number of the local chauffeurs, and the inability of the police to exact that measure of respect from all classes of drivers which is the secret of successful traffic management in England, is considered.

#### At Hunting Meets.

SHROPSHIRE masters of fox hounds have quite taken to the motor-car, and so loyal are the farmers to the genial masters of the various hunts that it would seem that the last vestige of prejudice against motors would disappear from the country side. There are few more ardent followers of hunting than the genial master of the South Shropshire hounds, Mr. Dun Waters, and the other week, in the dress of the hunting field, he drove through Shrewsbury in a large car. Mr. Frank Bibby, the master of the North Shropshire hounds, has also brought the motor-car largely into his service. His large Daimler and powerful 40-h.p. wagonette are familiar on Shropshire roads. Amongst Montgomeryshire gentlemen, Mr. David Davies, M.P., another master of fox hounds, is a keen auto-

To check reckless drivers, the Wolseley Co. have erected a barrier at their Garage in Westminster, which is raised by a cord in the time-keeper's office. Every chauffeur must obtain a pass on leaving the gates, and his number and the exact time of his departure and return are recorded.

mobilst, and has quite a number of cars, while we learn from the "Oswestry Advertiser" that some London gentlemen are combining motoring and shooting in their brief periodical breaks from business in the City. Reaching Shrewsbury by train, their method is to hire a car from the Shrewsbury Motor Garage, and go on by road to Holyhead, where they have their shooting, staying a couple of days and getting back to Shrewsbury in time to catch the night train to London. Thus in a minimum of time they get the maximum of motoring and shooting out of a two days' trip to out of the way Anglesey.

CONSEQUENT on the pressure on our space, owing to the Blackpool race meeting, the prize photographs are unavoidably held over.

THE present insurance arrangements between the Motor Union and the General Insurance Corporation for the insurance of members' cars expire on December 31st next, and in view of this a special scheme has been prepared and will come before the general committee at their meeting on Wednesday next. Details of the proposals will be made known at an early date.

# The Blackpool Motor Meeting.

"A MERRY CHRISTMAS," said a friend to us on Saturday last, as we hurriedly made for shelter to escape from the hailstorm which added its quota of discomfort to spectators and competitors alike. The greeting was by no means *mal apropos*, for, truth to tell, the clerk of the weather came much nearer to preventing the Blackpool motor meeting taking place than ever did the few inhabitants who unsuccessfully invoked the aid of the law in support of their objection to the closing of a portion of the Promenade. As it was, the elements caused a curtailment of the first day's proceedings, and rendered those on the second anything but enjoyable. Everything that was humanly possible to render the event a success had been done by the organisers—the Blackpool and Fylde District Motor Club, of which Mr. A. Huntley Walker is the chairman, was the moving

Co.—who brought their cars down from Coventry in a special L. and N. W. train—Clement-Talbot, Ltd., and other concerns. Altogether 163 entries were received for the first day's events, and over 200 for the second, the gathering thus being by far the most important yet held in this country. The course was not so long as that made use of last year; it extended from below the Victoria Pier at South Shore to just beyond the Central Pier, a distance of nearly two miles. The cars ran on the Marine Parade on the seaward side, which extends right to the edge of the sea wall, the railings alone separating the vehicles from the beach. The spectators were confined to the land side of the Promenade, and enclosed between them and the Parade was the tram track, which was utilised for the return of the competitors to the starting point—a considerable improvement on last year, when the

A Bird's Eye View of the Track

spirit of the whole meeting—and it was unfortunate that the only thing they could not control proved infractious.

Arriving in the Brighton of the North late on Thursday the 11th inst., we found the town as full of motor-cars as of familiar faces, all the well-known motorists and motor traders of the country being present. The headquarters were, as usual, at the Hotel Metropole, the resources of which were taxed to the utmost. Some excitement had been caused in the afternoon by the arrival from London of a large party which had made the 250-mile journey in a couple of days by means of two Darracq-Serpellet steam omnibuses. A further contingent left the Metropolis on a Fiat bus on the Thursday morning and arrived in the small hours of Friday, having made the trip well under the twenty-four hours, including stoppages for refreshments, &c., en route.

As was expected, quite a fleet of Darracq cars took part in the meeting, which was, however, well supported by the Daimler

cars had to make their way back through the crowd. A run down the track on Mr. Gordon Usmar's Vinot car, which was being used for marshalling purposes, showed that much better plans had also been made to keep the spectators informed as to the results of the races, announcement boards being fixed at different points along the course, to which the names of the winners of the different races and their times were promptly communicated by means of the excellent temporary installation of thirteen telephones carried out by Mr. Charles Furness, the Blackpool Borough Electrical Engineer. On each day the usual luncheon interval was dispensed with, the programme being carried through without a break.

## FRIDAY'S RACING.

Promptly at the hour fixed—midday—the meeting proper opened with a standing mile handicap for fully-equipped touring motor-bicycles, in which pedalling was only allowed for the first hundred yards. The entries numbered twenty-five

and of these practically all put in an appearance. The event was run off in four heats, the first in each and the two fastest losers competing in the final, which resulted in a win for R. M. Brice, who, on his 3½-h.p. Brown machine, covered the mile in 1 min. 25 1-5 sec. (40·3 miles per hour) reduced by his 16 sec. start to 1 min. 9 1-5 sec. net. F. Hulbert, 3-h.p. Triumph (20 sec.), was second, and W. W. Genn, 3½-h.p. Minerva (10 sec.), third. The race was one of the most hotly contested of the day, the riders keeping well together, to the delight of the spectators. This was followed by the mile scratch race for motor-bicycles of any size or weight, in which the four British competitors—Messrs. Rignold, Rose, Tessier, and Genn—were pitted against the famous French racers Cissac and Giuppone, both riding 14-h.p. double-cylinder Peugeot's. There were two heats, Giuppone winning the first and Genn the second, Cissac having difficulty in getting away promptly. In the final, the high power of Giuppone's machine led him to victory in 1 min. 0 1-5 sec. (59·8 miles per hour), Genn, on his 6-h.p. Minerva, taking the second place with 1 min. 9 4-5 sec. to his credit.

The car events were all over a standing mile, the first one being restricted to vehicles of a chassis price of below £300. They had to be fitted with standard touring bodies and carry four passengers. The entries—nine in number—included two 10-h.p. Darracqs, a 14-h.p. Vulcan, a 12-14-h.p. Calthorpe, a

A. Lee Guinness on a 15-h.p. Darracq and the 24-30-h.p. Baye, and between the two Stars, only two-fifths of a second separating them at the finish. The result of the race was:—1, H. G. Day, 12-16-h.p. Clement-Talbot, 1 min. 26 2-5 sec. (41·6 m.p.h.); 2, J. Reid, 16-20-h.p. Beeston-Humber, 1 min. 27 sec.; and 3, Mr. M. Ross Browne, 22-h.p. Minerva, 1 min. 27 2-5 sec.

Sixteen cars faced the starter in the class for cars of a chassis price up to £650, they comprising a 30-h.p. Darracq, a 30-h.p. Thornycroft, three 28-h.p. Daimlers, a 40-h.p. Rapid, a 35-40-h.p. Beaufort, a 40-45-h.p. New Eagle, a 20-32-h.p. Darracq, three 20-35-h.p. Darracqs, a 24-30-h.p. Richard-Brasier, a 40-h.p. Bianchi, a 16-20-h.p. Coventry Humber, and a 20-h.p. Rothwell. Although good times were made, very few real contests were seen between the cars, which were sent off in pairs, the most keenly contested one being that between Mr. Warwick Wright's 30-h.p. Darracq and the 30-h.p. Thornycroft. The result was:—1, Mr. Warwick Wright (30-h.p. Darracq), 1 min. 18 1-5 sec. (46 m.p.h.); 2, Mr. A. Lee Guinness (20-35-h.p. Darracq), 1 min. 18 2-5 sec.; 3, Mr. Tom Thornycroft (30-h.p. Thornycroft), 1 min. 18 4-5 sec. The class for cars of a chassis price up to £900 naturally brought out some high-power vehicles, and increased the interest of the spectators. There were nineteen entries, and of these, notwithstanding rain and a wet track, the following sixteen

Miss Dorothy Levitt returning along the Tram Track to the Starting Point after doing the Flying Kilometre in 24 3-5 seconds.

12-h.p. Ribble, a 10-12-h.p. New Eagle, a 9-h.p. Vauxhall, and two 10-12-h.p. Humbers. These were sent down the course three at a time, the 14-h.p. Vulcan, driven by Mr. T. Rimmer, proving the winner, his time being 1 min. 37 1-5 sec. (37 m.p.h.), Mr. W. Ashford's 10-12-h.p. New Eagle being second in 1 min. 49 4-5 sec., and Mr. R. M. Wright's 10-12-h.p. Humber third in 1 min. 51 1-5 sec.

The mile contest for touring cars of a chassis price under £450 brought out the largest field of the day, no less than twenty-five out of the twenty-nine entries competing. The cars, among which were a number of those built for the Tourist Trophy event, included a 16-20-h.p. Argyll, three 15-h.p. Darracqs, two 16-20-h.p. Humbers, two 16-20-h.p. Rovers, an 18-24-h.p. Courier, three 22-h.p. Minervas, a 20-h.p. Calthorpe, five 12-16-h.p. Clement-Talbots, a 15-20-h.p. Unic, an 18-h.p. Germain Chainless, a 20-24-h.p. National, a 14-h.p. Germain, a 24-30-h.p. Baye, and two 18-h.p. Stars, the latter being driven by Mr. E. Lisle, sen., and Mr. F. R. Goodwin. An amusing feature was the extraordinary positions taken by the passengers to reduce "windage," they being huddled up in all sorts of strange attitudes. The cars were sent off in batches of three, and owing to some of them getting away badly very few real races resulted. Two of the best contests were those between Mr.

faced the starters:—Six 35-h.p. Daimlers, a 35-45-h.p. Daimler, a 40-h.p. Brouhot, a 50-h.p. Ariel Simplex, a 35-40-h.p. of the same make, a 50-h.p. Napier, two 30-40-h.p. Daimlers, a 60-h.p. Beeston Humber, a 40-h.p. Darracq, and a 40-h.p. Berliet. The cars were again sent down in couples, the most tightly contested race being that between Messrs. A. Farnell and R. S. Grigg's Daimlers. The 40-h.p. Darracq driven by Mr. A. Rawlinson, however, proved the speediest of the bunch, he winning the event amidst the cheers of the spectators in 1 min. 2 1-5 sec. (57·8 m.p.h.), Mr. E. M. C. Instone, on his 35-h.p. Daimler, being second in 1 min. 9 sec., and Mr. R. S. Grigg, on a similar car, third in 1 min. 9 2-5 sec. The feature of this event was the consistent running of the eight Daimlers which took part in it, less than nine seconds dividing the first and last of the team, which secured seven out of the first eight places.

Heavy rain was experienced during the major part of the time of the contest between the entries in the unrestricted touring car class. There were eleven starters, ranging from an 18-h.p. Germain to a 100-h.p. Mercedes, and including also a 50-h.p. Ariel Simplex, two 35-h.p. Daimlers, three 45-h.p. Daimlers, a 35-40-h.p. Beaufort, a 40-h.p. Mercedes, and a 40-h.p. Darracq. The last-named was again driven to victory by Mr. A. Rawlinson in exactly the same time as in event No. 6 (1 min.

2 1-5 sec.), Mr. E. E. Wadcoat's 100-h.p. Mercedes being second in 1 min. 8 4-5 sec., and Mr. Birtwistle's 45-h.p. Daimler third in 1 min. 9 1-5 sec. No entries having been received for Event 8, which was confined to steam cars, attention was next centred on the standing mile race for motor-buses, which, in spite of its probable undesirability from the point of view of causing the public to expect greater speeds than are reasonable and safe in this class of vehicle, did more to rouse the enthusiasm of the spectators than all the contests which had preceded it. Seven entries had been received, and of these all but one turned up, viz., a couple of Darracq-Serpollet steamers, a Fiat, a Ryknield, a Critchley-Norris, and a Leyland. The last two had char-a-banc bodies, while the others had the standard double-decker. Each vehicle carried its full complement of passengers, who caused much excitement in the way they urged their respective drivers on by cheers. The machines were sent off in couples; the Fiat first beat the Ryknield, then came the two steamers, and finally the Critchley-Norris and Leyland char-a-bancs, the latter being driven by Mr. H. Spurrier. As was to be expected, the Darracq-Serpollets from the point of view of speed proved superior to their petrol rivals. The authorities decided that no times should be published; instead, the best performance was treated as zero, and the time by which the other vehicles exceeded this

frequently blew the figures off the result boards and sent them careering along the track. The proceedings again commenced at mid-day, but there were relatively few spectators at the start. Although it had been decided to carry through the programme, the order was not adhered to, Event 18, the flying kilometre for cars of a chassis price up to £300, being the first to be run off. Out of the eight entries five turned out. The 14-h.p. Vulcan, driven by Mr. T. Rimmer, again showed its speedy qualities, its time being 1 min. 3 3-5 sec. (35.1 m.p.h.), Mr. R. M. Wright being second on his 10-12-h.p. Humber in 1 min. 4 4-5 sec., and a 10-12-h.p. Coventry-Humber, driven by J. S. Stafford, third in 1 min. 12 3-5 sec. The competitors in Class 19, chassis up to £450, were sent off in pairs, but no exciting finishes were witnessed, and it would have greatly increased the interest if the three fastest cars had been given a chance of racing between them for the first place. There were twenty-four cars in the event, the types including Argylls, Darracqs, Humbers, Rovers, Belsize, Couriers, Minerva, Calthorpes, Clement-Talbot, Unic, Germain, National, Baye, and Star. The 18-24-h.p. Belsize was driven by Mrs. Riley, who met with a cheer as she finished a couple of seconds in front of Mr. A. C. Gibbons, 18-24-h.p. Courier. The winner proved to be Mr. H. Ramotsy, who drove his 18-h.p. Germain over the flying kilometre in 51 sec. (43.8 m.p.h.), Mr. P. Graham's 16-20-h.p. Rover being second in 53 3-5 sec., and another 18-h.p.

The Hon. A. Lee Guinness on his 200-h.p. Darracq Racer.

was given in seconds, with the following results:—1, Darracq-Serpollet (No. 135) zero; 2, Fiat, 17 sec.; 3, Darracq-Serpollet, 29 2-5 sec.; 4, Critchley-Norris, 30 3-5; the Leyland and the Ryknield tying for the fifth place with 31 1-5 sec.

The racing car events were the next on the programme, but the rain was coming down so steadily that the officials, after considerable delay, decided that it would be unsafe to continue. In the meantime several of the racing cars went down the track at a rattling speed, by way of testing its safety, and one or two swerved somewhat unpleasantly near the grand stand. Mr. Walter Gibbons was among those who risked the rain and the danger of skidding, doing the standing mile on his 50-h.p. Itala, which had been stripped of its ordinary body, in 46 1-5 sec. The 120-h.p. De Dietrich, the 100-h.p. Darracq, and the 100-h.p. Itala, with Gabriel, Demogeot and Mr. H. R. Pope driving, also tested the safety of the track under the unfavourable atmospheric conditions, with the result that it was decided about 4.30 p.m. to bring the day's proceedings to a close.

#### SATURDAY'S RACING.

The second day, from the point of view of the weather, was, perhaps, even more disappointing than the first. Throughout the morning there were periods of sunshine and rain, both unfortunately being accompanied by a piercing cold wind, which

Germain driven by M. Servais third, in 54 1-5 sec., the latter just beating Mr. A. E. George's 16-20-h.p. Argyll by 1-5 sec.

Attention was next turned to the motor-bicycles, the flying kilometre for tourists (Event 16) being run off first. There were no less than nine heats, but no final, the winners being selected according to the fastest times made. The result was:—

Driver.	Car.	Start.	Gross time.	Net time.
		Sec.	Sec.	Sec.
1 H. Reed	5-h.p. Peugeot	3	45 4-5	42 4-5
2 W. W. Genn	3 1/2-h.p. Minerva	5	48	43
W. H. Wells	5-h.p. Vindec	4	47	43
3 A. Edmondson	5-h.p. Derwent	3	49 3-5	46 3-5

There were only five competitors in the flying kilometre scratch motor-bicycle race, W. W. Genn (6-h.p. Minerva), H. P. Rose (5-h.p. Roc), and A. N. Orr (7-h.p. J.A.P.) being the only English riders to face the redoubted Frenchmen, who carried off first and second place, with a big margin. The first was Cissac, who, while not equalling his record of 27 3-5 sec., established on the same track last year, covered the kilometre in 29 sec. (77.1 m.p.h.); Giuppone, on his 14-h.p. Peugeot, was second in 30 4-5 sec.; and W. W. Genn third in 38 4-5 sec.

Although still bitterly cold, the weather had now taken a brief turn for the better, and the number of spectators rapidly increased when it was announced that the next event would be

(Continued on page 696.)

## THE BLACKPOOL MOTOR MEETING.

A View of the Track from the Starting Point.

Femogeot preparing to start in the Standing Kilometre Event.

A couple of 12-16-h.p. Clement-Talbot Cars passing the Grand Stand.

(Continued from page 694.)

the flying kilometre for racing cars up to 650 kilogs. (Event 25). The entries included two 80-h.p. Darracqs, an 80-h.p. Napier, a 50-h.p. Itala, and an Argyll light racer, the latter being one of the Tourist Trophy cars, which had been stripped to such an extent that it was little more than a skeleton chassis. Although travelling against a strong wind, Mr. Huntley Walker drove his 80-h.p. Darracq into the first place with 30 2-5 sec. (73.5 m.p.h.) to his credit, Mr. Walter Gibbons (50-h.p. Itala) being second in 38 4-5 sec., and Mr. Orrell Wren's 80-h.p. Napier third in 41 4-5 sec. The Argyll was fourth in 45 2-5 sec., equal to 49.2 miles, a performance which brought its driver, Mr. A. E. George, many congratulations. The good weather did not last long, but five more racers turned out for Event 26—the flying kilometre for four-cylinder racing cars up to 1,000 kilog. The cars went down the track one at a time, the result being as shown below:—

Driver.	Car.	Time.	Miles
		Sec.	per hour.
Warwick Wright...	100-h.p. Darracq	26	86
Demogeot ...	100-h.p. Darracq	26 4-5	83.41
J. E. Hutton ...	135-h.p. Mercedes	27 3-5	80
H. R. Pope ...	100-h.p. Itala	29 3-5	75.51
Gabriel ...	120-h.p. De Dietrich	30 3-5	73

To save weight and reduce windage Mr. Warwick Wright had removed the radiator from his car, putting in its place a

A wave of excitement and expectation arose among the spectators when it was announced that the next item would be Miss Dorothy Levitt's attempt on the flying kilometre record, on the 90-h.p. six-cylinder Napier. Clad in a white mackintosh, she came along at a terrible pace, and when 24 3-5 sec. (90.9 m.p.h.) went up on the board, the freezing crowd thawed sufficiently to give the daring driver a rousing cheer as she drove back along the side track, as shown in one of our illustrations, to prepare for a second trial. Only a few minutes elapsed ere she was back again, covering the course in identically the same time. In fact, it is noteworthy that all the three runs the car made over the flying kilometre—once with Mr. C. Edge at the wheel, and twice with Miss Levitt—were all done in the same time, 24 3-5 sec. With the view of keeping up the interest of the visitors, one of Friday's events (No. 10, the standing kilometre for racers under 650 kilog.) was next taken in hand. Only three competitors, however, turned out, Mr. A. Huntley Walker winning easily in 41 2-5 sec. (52.75 m.p.h.), on his 80-h.p. Darracq, Mr. Walter Gibbons (50-h.p. Itala) being second in 49 3-5 sec., and Mr. Lewis Aspinall (80-h.p. Darracq) third in 1 min. 7 1-5 sec.

Events 11 and 12 were next proceeded with. They were both over the standing kilometre; the former was for four-cylinder racers up to 1,000 kilog., and was won by Mr. Warwick Wright on his 100-h.p. Darracq in 35 sec. (63.9 m.p.h.), Mr. J. E.

The Race between Mr. Geo. Burton's 28-h.p. Daimler and Mr. H. P. MacConnell's 40-h.p. Rapid.

small tank placed vertically in front of the engine. Notwithstanding this Demogeot, who first came into prominence by his exploits in Florida last January, was only four-fifths of a second behind him. The mechanic on Demogeot's car attracted much notice by lying full length, with his head to the rear of the vehicle, the while the latter was tearing along at a rate of over 83 miles per hour. Gabriel, the well-known Gordon Bennett driver, made his first public appearance on the Blackpool track in this event, but his car was apparently not *au point*, and did not run in the next race, which was the "great event" of the day, No. 27, the flying kilometre for four, six, or eight-cylinder racing cars up to 1,000 kilog. The "field" consisted of Mr. A. Lee Guinness's 200-h.p. eight-cylinder Darracq, Demogeot's 100-h.p. four-cylinder Darracq, Mr. J. E. Hutton's 135-h.p. Mercedes, and Mr. Cecil Edge's 90-h.p. six-cylinder Napier. The contest, although an easy win for the "200," did not result in any new times, much to the disappointment of the Blackpool folk, who are always proud when records—not merely those connected with automobiles—are broken in their popular seaside resort. The record is 19 sec., held by Mr. Guinness, who on Saturday was only able to do the kilometre in 21 sec. (106.5 m.p.h.), Mr. C. Edge being second in 24 3-5 sec., and Demogeot third in 27 sec.

Hutton (135-h.p. Mercedes) being second in 38 4-5 sec., Demogeot (who drove his 100-h.p. Darracq dangerously near the fence) third in 39 sec., and Gabriel (120-h.p. De Dietrich) fourth in 41 4-5 sec. The struggle for first place in the open 1,000 kilog. racing class lay between Mr. Guinness's 200-h.p. Darracq and Mr. C. Edge's 90-h.p. Napier, they both covering the distance in 33 3-5 sec., necessitating another run down for each competitor. The result was a victory for the eight-cylinder, which improved its time to 32 3-5 sec. (70.7 m.p.h.), thus creating a new world's record, the previous best, also standing to the credit of Mr. Guinness, being 33 2-5 sec. The Napier took second place with 33 4-5 sec., Mr. Hutton (135-h.p. Mercedes) was third in 38 1-5 sec., and Demogeot, who again drove too close to the left, almost touching one of the official cars near the grand stand, fourth in 39 3-5 sec.

The flying kilometre for touring cars up to £650 (Event 20) next claimed attention. Seventeen vehicles competed, including three Daimlers, six Darracqs, a New Eagle, a Thornycroft, a Beaufort, a Rapid, a Bianchi, a Hardman, a Rothwell, and a Humber. The best race was that between Mr. Warwick Wright's 30-h.p. Darracq and Mr. Tom Thornycroft's 30-h.p. car, these taking second and third places in respectively 45 4-5 sec. and 46 sec. The winner was, however, found in

Mr. Ralph Jackson, who drove a new make of car, a 40-45-h.p. New Eagle, in the fast time of 43.45 sec., equal to fifty-one miles per hour. The more powerful cars in Event 21, for cars up to a chassis price of £900, followed, the eighteen competitors including no less than eleven Daimlers, two Ariels, a Napier, a Berliet, a Humber, a Darracq, and a Brouhot. Mr. Rawlinson, on the 40-h.p. Darracq, repeated his victory of the preceding day, finishing first in 33 sec. (67.7 m.p.h.), beating Mr. A. Farnell's 35-h.p. Daimler (second) by a fifth of a second, Mr. E. M. C. Instone taking the third place on his 35-h.p. Daimler with 35.45 sec. The speeds in this class for the flying kilometre ranged from 43.6 to 67.7 miles per hour. The steady running of the Daimlers was again the principal feature, all the places from the second to the ninth being taken by these cars. Just a dozen took part in the unrestricted touring car contest over the flying kilometre (Event 22). Of them five were Daimlers, two Germans, two Mercedes, while the Darracq, Ariel, and Rochet-Schneider were represented by one each. The speedy qualities of Mr. A. Rawlinson's 40-h.p. Darracq—the cylinder dimensions of the engine are given as 160 mm. by 140 mm.—again demonstrated themselves, the car finishing in 32.45 (68.1 m.p.h.), or just a fifth of a second in advance of Mr. A. Huntley Walker's 100-h.p. Mercedes, which went down the track at the same time, so furnishing one of the

Mr. Walter Gibbons again being second on his 50-h.p. Itala in 1 min. 11.45 sec., and Mr. L. Aspinall (80-h.p. Darracq) third in 1 min. 43.15 sec. Little interest was evinced in Event 29, a standing mile handicap, confined to members of the automobile clubs in Lancashire, notwithstanding that the race was well supported by motorists in the County Palatine. Eighteen competitors took part in it, the cars ranging from a 9-h.p. Riley to a 60-h.p. Mercedes, and the starts from 5 sec. to 55 sec. When the times were worked out it was found that the first two places had been taken by Daimlers and the third by the De la Buire, as follows:—

Driver.	Car.	Start. sec.	Actual min.	Time. sec.	Net Time. min. sec.
1. H. Lonsdale	30-h.p. Daimler	15	1	21.45	1 6.45
2. Gordon-Chapman	30-h.p. Daimler	15	1	22.25	1 7.15
3. H. Hollingdrake	15-20-h.p. De la Buire	24	1	32.15	1 8.15

Another event deprived of its interest by the weather was No. 30, the standing mile handicap open to any type of Darracq touring car, for which the first prize was a £200 cup. In addition, cups of the value of £10 were offered for the drivers of the cars making the best times according to the class of car. Eighteen competed, but neither the times nor the allowances were announced, and it was not until Monday that the result, which is given below, was made known. The £200 cup was secured by Mr. J. Lumb, jun., 20-32-h.p. car, Mr. J. Keele

Mr. A. Huntley Walker on his 80-h.p. Darracq.

Gabriel on the 120-h.p. De Dietrich.

most exciting races of the day. The third place was taken by Mr. Percy Martin, who on a 45-h.p. Daimler covered the kilometre in 33.15 sec. The results in this event were altogether of a notable character, only a fifth of a second dividing the first three, while eight cars finished within 4.25 sec. of the winner.

Event 23, which was for steam cars, having proved barren of entries, No. 24 was next proceeded with, it being a flying kilometre contest for motor-buses, which was run off in a blinding hailstorm. The Darracq-Serpollet (No. 135) again romped in an easy winner. Following the example set on the previous day, the actual times were not given out, the result being that the Fiat was second, 9.45 sec. behind the winner; the Critchley-Norris (No. 183), third, 11.35 sec.; the Darracq-Serpollet, fourth, 11.45 sec.; the Leyland, fifth, 17 sec.; the Ryknield, sixth, 30.25 sec.; and the second Critchley-Norris, seventh, 54.45 sec.

The wretched weather was by this time having its effect on the spectators, the crowd thinning down considerably, and on the grand stand, which previously had been packed, there remained but a few cold and miserable, yet enthusiastic, spectators determined to see the meeting through at all costs. The first event after the 'buses was No. 13, the standing mile for cars up to 650 kilog. There were only three competitors, Mr. Huntley Walker winning on his 80-h.p. Darracq in 57.15 sec. (62.9 m.p.h.),

being second on a 10-h.p., and Mr. H. Kennedy third on a 15-h.p. As regards the small cups for the class winners, these have been allotted to Messrs. G. F. Heath and Co., 20-35-h.p.; Mr. J. Lumb, jun., 20-32-h.p.; Mr. H. Kennedy, 15-h.p.; Messrs. Hopkins, Sully and Co., 15-h.p.; Messrs. G. F. Heath and Co., 10-h.p.; and Mr. J. Keele, 10-h.p.

Time was now getting on and the light rapidly failing, yet there were still three racing car events to run off, which apparently the officials at the start agreed to combine into one—a decision which somewhat mystified those at the finishing point, the big racing cars coming down in anything but the expected order, while towards the end it was with the utmost difficulty that the drivers of the monsters could see their way or the time-keepers their watches. Indeed, the last few cars made their runs by the aid of the electric light, which, combined with the flashes of flame bursting from the engines of the racers, rendered the scene one long to be remembered. Altogether the finishing contest was of an exciting character, and it was fortunate that no accident occurred. The three events which were rolled into one were all over the standing mile as follows:—No. 14, for four-cylinder 1,000 kilog. racers; No. 15, 1,000 kilog. cars of any number of cylinders; and the standing mile handicap. The first of the trio was won by Mr. Warwick Wright in 51.15 sec. (70.3 m.p.h.), Mr. Huntley Walker being second in 54.35 sec.,

and Demogeot third in 56 3-5 sec., all three places being thus taken by Darracqs. In Event 15 Mr. Guinness with his "200" was the winner in 45 3-5 sec. (78.9 m.p.h.), Mr. C. Edge (Napier) second in 51 1-5 sec., and Demogeot (Darracq) third in 56 3-5 sec. The handicap (Event 28) proved a win for the Argyll light racer, the starts and times of the competitors being shown in the following table:—

Driver.	Car.	Start. sec.	Actual min.	Time. sec.	Net Time. sec.
1. A. E. George	Argyll light racer	40	1	2 3-5	43
2. A. L. Guinness	200-h.p. Darracq	—	—	45 3-5	45 3-5
3. C. Edge	90-h.p. Napier	5	—	51 1-5	46 1-5
4. Warwick Wright	100-h.p. Darracq	3	—	51 1-5	48 1-5
5. Huntley Walker	80-h.p. Darracq	5	—	54 3-5	49 3-5
6. Demogeot	100-h.p. Darracq	3	—	56 3-5	53 3-5
7. J. E. Hutton	135-h.p. Mercedes	2	—	58 1-5	56 1-5
8. H. R. Pope	100-h.p. Itala	4	1	1	57
9. Gabriel	120-h.p. De Dietrich	3	1	16 1-5	73 1-5

The third record of the meeting was established in this joint event, Mr. Huntley Walker's 80-h.p. Darracq setting up new world's times for the 650 kilog. racer class, the previous best being 56 sec., standing to the credit of Hanriot and a Clement-Bayard.

largely due the success of the meeting—for success it was, despite the bad weather. Pressure on space prevents us from recording the names of all the officials, but among those we came in contact with, and to whom, in addition to the always genial chairman, Mr. Huntley Walker, our thanks are due for their assiduous attention, are Mr. Hugh Butcher, Mr. G. J. Nearing, Mr. Norman S. Taylor, and Dr. Walter. The various events were run off with a dispatch which contrasted pleasantly with the tedious waits of previous years, while another testimony to the efficiency of the arrangements was the absence of protests, Mr. Bird informing us that the clerks of the course had had but one to deal with.

The social functions of the meeting included a dinner on the Friday evening, given by Messrs. A. Darracq and Co., Ltd., to their friends, and one to the competitors and guests by the Blackpool and Fylde District Motor Club on the Saturday. Both were held at the Hotel Metropole, and at the first Mr. J. S. Smith-Winby, chairman of the Darracq-Serpollet Omnibus Company, Ltd., presided. The speeches were commendably brief, the most important being that of Alderman Grime, who, on behalf of the Blackpool Corporation, welcomed the visitors.

Mr. A. Huntley Walker and the Hon. A. Lee Guinness with the valuable Cups they won at the Blackpool Meeting.

The special prizes offered by the Daimler Co. to owners of competing Daimler cars were awarded as follows:—Standing mile for touring cars under £650, Mr. Geo. Burton (28-h.p.); ditto, for chassis under £900, Mr. R. S. Grigg, 35-45-h.p.; ditto, for chassis of any value, Mr. A. Birtwistle (45-h.p.); and flying kilometre for cars up to £900, Mr. F. A. Bolton (35-h.p.).

#### A SUCCESSFUL GATHERING.

Notwithstanding the adverse conditions which prevented the racers being driven "all out," new times were set up in three events. Two of them are world's records, and have already been chronicled. The third is the British record of 21 sec. for the flying kilometre, which was established by Mr. A. Lee Guinness, his time being 2-5th sec. better than that created by Mr. Clifford Earp on the same track last year. Colonel Holden, Captain Orr-Ewing, and Mr. Alfred F. Bird acted as clerks of the course, Aldermen T. Bickerstaffe, Brodie, Grime, and Heap as the judges, while Messrs. Ebbelwhite, Dutton, Glazebrook, and Straight ably carried out the duties of timekeepers. Quite a large number of members of the Blackpool Motor Club were enrolled as marshals and stewards, and to their energy was

Referring to the slight opposition that had been encountered to the motor races, he stated that the municipal authorities were strongly in favour of an annual meeting. October was, however, too late, and he suggested the second week in June as being a more agreeable and suitable date for next year's event. Mr. A. Huntley Walker occupied the chair on Saturday evening, and as he rose to propose the toast of the King he met with a deservedly hearty reception. He afterwards read the results of the various races, and paid a tribute to the help he had received from the members of the Blackpool and Fylde Motor Club and from the Corporation.

Owing to the late hours at which the races concluded the distribution of the prizes was deferred until Monday, when they were handed to the successful competitors, or at least to those who had waited for them, by Mrs. Huntley Walker, at the Town Hall. Mr. W. W. Ashley, M.P., presided, and spoke of the good the meeting had done the town of Blackpool by bringing competitors from all parts of England and the Continent. Mr. Huntley Walker described the track as the finest in the world, and stated that if the weather had been better there was no doubt that the times would have been very much improved upon.

## THE WEIGEL CAR.

WE learn from Mr. D. M. Weigel, the managing director of Weigel Motors, Ltd., that the new car, the construction of which has been in hand for some time, is now nearing completion and will shortly be on the road. The vehicle, which is of British construction throughout, with the exception of the magneto, is of 40-h.p. and comprises a number

Fig. 1.

of interesting features. A full description of the car is not at present available, but in the meantime we are able to give some particulars and illustrations of the disc clutch and cardan joints employed. Fig. 1 shows the various parts of the clutch block, which is made in nickel steel from a forging weighing 65 lb., machined down to 13 lb. The drum and shaft are in one piece,

Fig. 2.

the drum itself being hollowed out. Upon it are fitted forty-one discs made of spring steel, the whole being enclosed in a box cast solid with the fly-wheel of the engine. The cover is in phosphor bronze, and is in one piece, its centre forming the bearing. The fork end at the rear, which is made of a special steel case-hardened throughout, forms part of the cardan joint between the clutch and the gear-box.

The parts of the special design of cardan joint are shown in Fig. 2. At the left the case-hardened steel joint forks are shown coupled together by the plates. The coupling rings, which are also made of a special steel, are case-hardened throughout, and brazed, bored, and ground together, thus ensuring perfect fit, and it will be noticed that on the outside periphery there is an internal and external flange ensuring absolute rigidity by the tight contact of the two flanges. The fork ends are ground so as to give a correct bearing fit to the coupling plates. The whole joint is contained in a brass box filled with grease.

## A NEW SILENCER.

AN improved form of exhaust-box for use in conjunction with petrol motors has recently been introduced by Messrs. Rankin Kennedy and Sons, of Scotstoun, Glasgow. The apparatus, which is known as the air-cooled Ejector Condenser Silencer, is claimed to provide a clean, cool, silent exhaust, without back pressure. As will be seen from the illustration, which gives a sectional view of the Ejector Condenser, it consists of a sheet metal cylinder enclosing an expanding cone with a specially shaped throat. The exhaust gases enter the silencer through a nozzle concentric with the throat, thus forming an annular space which is carefully calculated so that as the exhaust flows past a strong current of air is drawn in through holes A in the neck of the silencer. The gases are thus immediately cooled, and any oil, smoke, or vapour is condensed. Passing along the inner cone the exhaust expands and slows in

velocity as it reaches the wide end, where its direction of flow is reversed, the gases being broken up as it emerges into the outer cylinder. Here they are again expanded and still further reduced in velocity and the direction of flow once more reversed at the end of the silencer. The gases then enter a passage which conveys them to the outlet, where they emerge cool and silent. The apparatus is usually constructed of sheet steel, but can also be supplied in copper, brass, or, where the minimum of weight is required, in aluminium.

THE programme for the Southern Motor Club's gymkhana at Cheam on Saturday, the 6th inst., was supplied by the Vacuum Oil Company, Ltd.

THE Parsons Non-Skid Company have acquired the selling rights in the "Sparklet" tyre inflator recently introduced by Aerators, Ltd. It consists of a small and handy form of gas-cylinder filled with liquid carbonic acid gas, such as is used to aerate mineral waters. It is fitted with a pressure gauge registering the resistance in pounds per square inch offered by the tyre, so that the degree of inflation can be regulated, and with the usual connection with valve nozzle and adaptors. The inflator is sent out in a compact wooden case, containing two cylinders capable of fully inflating an 870 by 90 mm. tyre ten times—each cylinder weighing about 9½ lb. When the gas-cylinders are empty they can be exchanged for full ones at a fixed charge. By use of the apparatus the irksome operation of inflating a tyre by means of a pump is obviated; instead of using the latter, all that has to be done is to attach the connection to the tyre and cylinder, turn on the wing nut, and release the gas, which flows evenly into the tyre, the pressure being steadily registered on the gauge.

## TOWN CARRIAGE COMPETITION.

**H**ITHERTO the efforts of the A.C.G.B.I. have been mainly directed, so far as competitions have been concerned, to improving the reliability of the motor-car as a vehicle for touring and endurance. There is no doubt of the good results that have followed its endeavours; and, although at present there seems little agreement as to what constitutes a touring body, many enthusiasts are sanguine enough to suppose that such a desirable settlement will ultimately be arrived at.

Meanwhile the Club has determined to encourage the design of carriages for town work—vehicles suitable for professional men by day and Society folks in attendance on evening functions. Motoring is often associated in the public mind with grimy faces, frost-bitten features, and general discomfort; an inspection of the carriages which were assembled at the Wolseley garage at Westminster on Monday and Tuesday would dispel that illusion. It was a collection of luxurious carriage work, in the design of which the comfort of the travellers was evidently the first care. This, however, was but one point of fourteen upon

a circle on the ground floor of the Wolseley building, the gallery affording visitors an opportunity of observing what must have proved a somewhat wearying function. The vehicles were drawn from their places to the centre of the hall, and there critically inspected with a view to the award of marks, which will subsequently provide guidance to designer and purchaser alike. Fortunately the three types of vehicle—electric, petrol, and steam—known to motorists are represented.

Of the vehicles in the competition the types of bodies are distributed as follows:—Double landaulet, 4; single landaulet, 2; landaulet, 15; double landau, 1; three-quarter landaulet, 1; Victoria, 1; limousine, 6; hansom cab, 1; mail phaeton, 1; and brougham, 1. The vehicles are divided into classes A and B for those costing below and above £600.

## CLASS A.

Car.	Type of body.	No. of seats.
16-20-h.p. Beeston-Humber	Limousine	4
14-18 Spyker	Landaulet	4
12-h.p. Georges-Richard	Landaulet	3
15-h.p. Siddeley	Limousine	4 or 5
14-16-h.p. James and Browne	Double Landaulet	6

The Town Motor Carriage Competition.—A View of the Cars in the Wolseley Co.'s Garage at Westminster.

which adjudication is to be made and marks allowed. The officials were expected to consider the following merits:—

General design of car and finish of body.  
Absence of (a) smell and smoke, (2) leakage of lubricant, (3) noise, (4) vibration.

Smoothness of running and comfort of passengers. An examination will be made as to the use of adequate tyres, size of wheels, spring suspension, and means of preventing road shocks.

Ease of cleaning (a) exposed metal work and coach work, and (b) machinery (including oiling).

Ease of access for repair (removal of body, access to important working parts, access to tools, to lubricating holes, and "stauffers," &c., removal of under shields, access to concealed gear.

A skilled man (who may be the driver) shall be in attendance to disassemble or detach or adjust any part of which he may be called upon to display the accessibility.

Ease of starting (a) cold, (b) after recent use, with relation to smooth action of clutch (if any) and to smooth yet rapid acceleration.

Ease of stopping and speed-changing without jerk or noise. An examination of the brakes will be made both as to their efficiency and design.

Ease of manœuvring.

Comfort of passengers in relation to cushions, folding seats (if any), &c., number of passengers carried exclusive of driver, access to interior by side entrance, exclusion of rain, storage space for tools and parts.

Comfort of driver in relation to easy manipulation, shelter from wind and rain, ease of signalling to other vehicles (without special mechanical devices being required for this latter purpose).

The first two days of the week the cars were arranged in

14-h.p. Georges-Richard	...	Limousine	...	4
14-h.p. Georges-Richard	...	Limousine	...	4
6-h.p. Oppermann Electric	...	Hansom Cab	...	3
10-h.p. Adams-Hewitt	...	Mail Phaeton	...	3
14-16-h.p. Argyll	...	Brougham	...	6

## CLASS II.

No.	Car.	Type of Body.	No. of seats.
1.	18-h.p. White Steam	Double landaulet	6
2.	18-h.p. White Steam	Single landaulet	4
3.	40-h.p. Napier	Landaulet	6
4.	12-16-h.p. Wilson-Pilcher	Landaulet	4
5.	20-h.p. Lanchester	Landaulet	4
6.	20-h.p. Lanchester	Double landau	6
7.	8-16-h.p. Electromobile	Landaulet	5
8.	8-16-h.p. Electromobile	Landaulet	4
9.	8-16-h.p. Electromobile	Landaulet	6
10.	8-16-h.p. Electromobile	Landaulet	6
11.	28-h.p. Ariel-Simplex	Single landaulet	4
12.	20-h.p. Pilgrim	Landaulet	5
13.	14-h.p. C.G.V.	Landaulet	5
14.	20-h.p. Dennis	Landaulet	4
15.	24-h.p. Germain	Landaulet	4
16.	10-14-h.p. Renault	Three-quarter landaulet	4
17.	Krieger Electric	Double landaulet	3
18.	Krieger Electric	Victoria	2
19.	14-16-h.p. Argyll	Double landaulet	6
20.	14-16-h.p. Argyll	Landaulet	6
21.	14-16-h.p. Argyll	Limousine	6
22.	16-20-h.p. Argyll	Landaulet	6
23.	16-20-h.p. Argyll	Limousine	6

NEXT year's Tourist Trophy race will probably be held in May or June, 1907.

THE New Arrol-Johnston Car Company, Ltd., point out that the 24-30-h.p. four-cylinder new Arrol-Johnston car did 37.9 ton-miles per gallon of petrol in the Scottish Reliability Trials.

So far as they have been announced there is a noticeable tendency toward increased prices for 1907 models among American manufacturers of what are generally recognised as high-class cars.

PRESSED steel frames for motor-cars are now being turned out on a large scale by Messrs. Mehan and Sons, Ltd., of the Scotstoun Ironworks, Glasgow, who are also manufacturing motor bonnets, radiators, silencers, &c., for the trade.

INCREASING business has compelled the Continental Tyre and Rubber Company (Great Britain), Ltd., of 102-108, Clerkenwell Road, London, E.C., to open a branch depot at 183, Great Brunswick Street, Dublin, which is to be in the charge of Mr. Richard A. Morrow.

A NEW instrument for registering the gradient of hills is being brought out by the New Colleshill Works Company, Ltd., Whittall Street, Birmingham. It is adapted to be fixed on the front of the car, and arranged so that an electric light can be attached to it in order that the dial may be illuminated at night time.

"VOCATIONS FOR OUR SONS" is the title of a new book published by Mr. T. Fisher Unwin, in which Mr. J. W. Hicks gives a series of hints with a view to assisting parents in setting their sons on life's highway. The information in most cases is somewhat light. The range of subjects dealt with is, however, fairly comprehensive.

THE U.S. Department of Agriculture is developing a new industry in the production of alcohol from corn-cobs. Investigations are being made at Hoopeston, Ill., and have proved that the large quantities of corn-cobs which every year go to waste can be made to produce alcohol in sufficient quantities to justify the erection of a distilling plant.

MR. T. H. DURRANS has just returned from a trip to Torquay and back on his 8-10-h.p. "Brown" car. During the journey of 400 miles he had no other trouble than replacing one sparking plug and once emptying water out of the carburettor. With four passengers and luggage he went to Salisbury on 2½ gallons of petrol, and averaged 33 miles to the gallon the whole way.

IN order to prevent robberies from their big garage at Westminster, or the removal of any car except by the person authorised by the owner, the Wolseley Company has brought a new system into operation which is claimed to be absolute perfection, and by means of which the owner can learn whether his chauffeur has utilised the car for his own purposes without permission.

IN his report for the past year the auditor of Leeds Corporation accounts says the hire of motor-cars for eight months totalled £432. The tramways' accounts show that the cost of two motor-buses was £1,525 9s. 6d., and their takings from January to the end of March, 1906, amounted to £44 6s. 8d., or an average of 4s. 11d. each, per day. Six months of renewals and accessories cost £377 17s. 11d., which amount does not include petrol.

MESSRS. BOTWOOD AND EGERTON's new motor garage in the main street of Newmarket was opened last week, the site on which the building stands covering three-quarters of an acre. It is next door to the house formerly owned by Baron Hirsch, and said to have been given to the King by Sir Ernest Cassel, who acquired it. In addition to accommodation for a large number of cars there are ample facilities for repairs and also for the safe storage of a large quantity of petrol. In making the local arrangements Messrs. Botwood and Egerton have had the benefit of the advice and assistance of Mr. F. R. Harding Newman, who has gone into partnership with them in this venture.

A MOTOR SCHOOL is being established in connection with the motor accessory business of Messrs. Gutteridge and Zambra, Ltd., 308, Euston Road, N.W.

THE Electrical and Motor Company have just removed to larger premises in Bridge Street, Banbury, where they have accommodation for fifty cars. The garage is open day and night, and they have a good selection of vehicles for hire.

MESSRS. PETER ROBINSON, LTD., of Oxford Street, W., have issued a new catalogue of fashions in furs, many pages of which are devoted to garments for motorists.

THE Town Council of West Bromwich is making application for the sanction of the L.G.B. to a loan of £740 for the purchase of a motor tender for the Borough Fire Brigade.

FOR driving a motor-car on the footway at Knightsbridge—a narrow passage-way for pedestrian traffic only—a motorist has been fined 5s. and costs at the Westminster Police Court.

A CHAUFFEUR charged at Bow Street (London) Police Court on Monday with being drunk whilst in charge of a motor-car was sent to prison for a month without the option of a fine.

The Eyre Anti-Skid as fitted to one of the London County Council's Motor Fire Engines. The illustration is interesting as showing that the device can be applied to a vehicle weighing over five tons. A special cable was used as well as extra strong fittings.

ON Tuesday a 4,000 miles trial of the Straker-Squire C.S.B. car commenced, under the auspices of the A.C.G.B.I. This is the vehicle that did well on its first appearance in the Scottish Trials, and with which Messrs. Straker and Squire, Ltd., hope to establish as great a reputation as they have associated with their name in the motor-bus business. It is designed by M. Cornilleau, and, while rated at 25-h.p., gives 32-h.p. on the brake at 1,000 revolutions. At present the activities of the makers will be restricted to this one type, but ultimately it is their intention to make a six-cylinder car as well as a smaller model of 14-h.p. The trial now in progress should demonstrate the reliability of the new vehicle, which will be driven on successive days by Messrs. Sydney Straker, T. R. Squire, and G. O. Thompson respectively. At the conclusion of the test of the Club, which will comprise daily runs of 165 miles for more than three weeks, the car will undergo speed runs on the Bexhill track. The result of this severe trial should be to promote the prosperity of the new works which Messrs. Straker and Squire, Ltd., have erected in Nelson Square, Blackfriars, S.E., these being admirably designed for the purpose of automobile showrooms, offices, and works.

## CONTINENTAL NOTES.

### A Procession of Old Timers.

The "Auto" of Paris, which the other Sunday organised a parade of old cycles, is now endeavouring to get up a similar event for old motor-cars, which, if carried out, should prove both interesting and instructive. Those who are known to have old vehicles in their possession are being asked to take part in the demonstration, which will probably consist in a run from the A.C.F., in the Place de la Concorde, to Versailles. The idea is being enthusiastically taken up, several 1896 Panhards, an 1898 Renault, an 1897 Delahaye, and an 1895 Roger having already been promised.

### Balloons and Motor-Cars.

In celebration of the twenty-fifth anniversary of the foundation of the Berlin Aeronautical Association, a balloon chase was held on the 10th inst., when four balloons ascended, followed by seventeen motor-cars belonging to the German Volunteer Automobile Corps. During the race the car of Herr Sierke ran into a tree, the driver and one of the passengers being injured. Three of the balloons descended without being caught by the motorists. The Lerche, the fourth to start, was however captured, the car arriving on the scene 22 minutes after its

One of the Darracq-Serpellet Steam Omnibuses which last week journeyed from London to Blackpool. The luncheon interval at Stony Stratford.

descent, or in 8 minutes less than the limit fixed by the rules of the contest.

### The Dourdan and Gaillon Speed Trials.

The first portion of the joint Dourdan-Gaillon speed trial meeting is to be held on Sunday next, when the standing mile and flying kilometre tests on the level will be run off. About thirty cars have been entered, and these will be required to take part in the flying kilometre hill climb at Gaillon on the 28th inst. It is possible that the Hon. A. Lee Guinness will be present with his 200-h.p. eight-cylinder Darracq.

### A Competition for 1907 Models.

The Competitions Committee of the A.C.F. is organising a "1907 model" competition, restricted to the cars of those firms taking part in the forthcoming Paris Salon. The event will take place prior to the Show, the idea being to enable makers to demonstrate, by taking part in a touring competition, the capabilities of their latest cars. It is proposed that the trial shall consist of a run from Paris to Nice and back, the journey each way to be done in three days. The competing cars will be divided into four categories according to maximum cylinder diameter and total weight of the vehicle. Any type of body may be fitted to the chassis, on condition that they are com-

pletely equipped for touring. Each day's stage will be about 250 kilometres, which will have to be covered in a maximum time, any car arriving after this being penalised one point for each minute. Entries for the trials will be received at the A.C.F. up to the 15th prox.

### France in Favour of Motor-Car Races.

The great topic of the hour in France is the decision of the Sporting Commission of the French Automobile Club in favour of the continuance of an annual automobile race. As to the basis on which the regulations shall be laid no agreement was reached, some favouring the retention of the 1,000 kilog. limit restrictions, while others are anxious for a contest in which the bore of the engine cylinders shall not exceed a certain maximum; still a further group would prefer a contest between cars having engines in which the maximum cylinder capacity is fixed. It is urged by those who oppose the weight limit that while this has served a useful purpose it only encourages makers to put in larger and larger engines than ever, without at the same time obtaining a proportionate increase in speed. The question of the employment of *jantes amovibles*, or detachable rims, was also the cause of much discussion, as was also the length of the circuit on which the race shall be held. Before any definite line is taken the committee of the A.C.F. have resolved to ask the different motor traders' associations for their views on the subject.

### A Taximeter Motor-Cab Race.

A somewhat novel race was held in Paris last week, when half-a-dozen taximeter motor-cabs took part in a run three times round the great Boulevards, the total distance being 31½ kilometres (19.7 miles). The competitors included a 14-20-h.p. four-cylinder Chenard-Walcker, an 8-11-h.p. three-cylinder Panhard, a 10-12-h.p. Tony-Huber, a 9-h.p. Renault, an 8-h.p. Clement-Bayard, and an 8-h.p. Unic, the last four having double-cylinder engines. As was to be expected, the race was a victory for the most powerful car, the Chenard-Walcker finishing first in 1 h. 3 min. 35 sec., equal to 18½ miles per hour. The Tony-Huber was second, the Renault third, the Panhard fourth, the Clement-Bayard fifth. Unfortunately the Unic met with a nasty skid, which, owing to a collision with a refuge, put it out of the competition in the last round. There was only eight minutes' difference between the winner and the last man.

### The Chateau Thierry Hill-Climbing Competition.

Owing to the course comprising a turn, which, in view of the increased speed of modern cars, might prove dangerous, it has been decided that the hill-climbing competition annually held at Chateau Thierry, France, shall not take place this year. The decision has caused considerable local disappointment, so much so that the Commercial Union of the town has approached the "Auto" and has offered to have the road altered to suit the changed conditions. It is therefore proposed to revive the contest next spring if the projected work can be carried through in time.

### Miscellaneous Items.

The West Bohemian Automobile Club has just been formed in Teplitz.—Two new motor fire-engines have just been added to the equipment of the Fire Brigade in Berlin. One vehicle is driven by steam and the other electrically.—A large motor racing track is, it is rumoured, to be constructed near Berlin.—It is announced from Berlin that the Grosse Berliner Automobil Gesellschaft has secured the agency in Germany for the Humber cars.—It is reported that twenty motor-cabs, fitted with taximeters, are shortly to be put in service in Monte Carlo.—One of the largest fires that has occurred in Paris for some years took place early on Sunday last, when the oil and petrol works of Messrs. Deutsch, at Pantin, were burnt out.—A 14-20-h.p. Weyher-Richemond steam car left Paris on Monday for a tour of France.—A Leon Bollée six-cylinder car is expected to make its debut at the forthcoming Salon.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### THE TOURIST TROPHY RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Following what I conceive to be Capt. Deasy's good example in criticising the rules and conditions governing the 1906 Tourist Trophy Race, and offering suggestions for 1907, I should like to make the following remarks. I am at one with Capt. Deasy in his praise of the manner in which the race was carried out this year, and also of the consideration and courtesy shown by the committee under what were, perhaps, rather trying circumstances.

My only grumbles this year were that rules were not strictly adhered to by the committee, in the following particulars at least:—

- (1) As to tuning up in the tents.
- (2) Allowing some cars to have two tries at twelve m.p.h. in the morning, instead of relegating all failures at first attempt to the afternoon.
- (3) Not making the hill climb conditions same as set down in rules.
- (4) Not adhering to rule with reference to bored frames.

For next year's race I would suggest the following:—

1. The race to be held in late June or early in July, when daylight comes soonest in the morning.
2. That practicing be only allowed between daylight and 6 a.m., Sundays included. No car to start the round later than 5 a.m. Disqualification to be the penalty for running after this unless delay on road through breakdown can be proved.
3. Chassis minimum weight to be 1,700 lbs. It is evident from this year's cars that a chassis can be made strong enough at this figure.
4. No bored out frames allowed, unless to such an extent as is adopted in any well-known make of car as a standard.
5. A minimum clearance from the ground of 9 in. to assist in the prevention of dust raising.
6. A minimum distance from dashboard to front of driver's seat of, say, 2 ft. 1 in., and a minimum distance from dashboard to front of back tyres of, say, 4 ft. 10 in.
7. No wheel base to be given.
8. Minimum width of driver's seat to be as at present, but width of back seat to be increased to 3 ft. 8 in. inside upholstery at front of cushion.
9. Minimum height of top of front of cushion from the ground to be 3 ft. 4 in.
10. Minimum weights to be carried by chassis to be as follows (and these must be adhered to).  
Body, including floorboards, wings, brackets, as this year, 350 lbs. (this allows of a strong standard body being fitted).  
Ballast to be carried in any desired form equal to five passengers of 12 stone, 840 lbs.  
The weight of the driver and mechanic to be deducted from this.
11. The petrol allowance to remain the same, as I believe greater efficiency will be shown next year than this.
12. The rule as to order of starting to be strictly adhered to, i.e., entries to be received not sooner than the morning after the race. If more than one entry be then received at one time the order of starting to be balloted for. I believe this rule has already been broken for next year's race.—Yours truly,

JOHN S. NAPIER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When considering the minimum weight that should be prescribed for a chassis for next year's Tourist Trophy Race, there are various points which should be, in my opinion, considered and settled before this, viz., the size and weight of body, wings, mudguards, steps, &c., and the minimum weight for driver, mechanic, and passengers, also the track and the distance from the dash to the front edge of the back tyres. I quite agree with the remarks of "H. W. E. B." that weight alone does not signify sufficient strength. Perhaps "H. W. E. B." has not borne in mind what are the requirements of a large section of the public in the way of a touring car. As far as I can ascertain, the majority of buyers require a car large enough to take five people and luggage, spare tyres, spares, &c. They also require a comfortable body, with sufficient leg space. Now, if these requirements are met, it means that the body must be a large and roomy one, which means increased weight, and, therefore, increased strength of the chassis, to enable it to carry that load successfully when driving fast over rough roads.

It is also well to bear in mind that there is an increasing demand for chassis suitable as regards size and strength for covered bodies. To my mind all these points should be carefully considered before arriving at a definite conclusion as to the exact minimum weight of chassis to be prescribed for next year's Tourist Trophy Race.

The minimum clearance of 7 in. suggested by Mr. J. Percy Dean is, I think, far too small, nor can I agree with him in his suggestion that the order of starting should be the same as this year, viz., in the order in which the entries are received. I think it would materially add to the popularity of the race if every competitor knew that he had a perfectly equal chance in this way, and that whether the entries are made now, or just before the closing of the list, there will be an equal chance to obtain a better position when starting. I quite agree that it is advisable to encourage a light and strong vehicle, but I do not think it at all in the interest of the public to encourage vehicles similar to many of those which took part in this year's Tourist Trophy Race, as they were far too light, and I doubt if many of them would have stood up over that course if called upon to carry a load equal to that of five passengers, luggage and spares, which is not an excessive load.—Yours truly,

H. H. P. DEASY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Captain Deasy's article in your issue of the 6th inst., re the rules for the next year's Tourist Trophy Race, I cannot say that I am in favour of some of his suggestions for the modification of the rules, and I suggest:—

(1) The minimum chassis weights to be increased. I am of opinion that 1,800 lb. would be more the average weight of a touring car chassis than 2,000 lb. That is to say, speaking from the point of view of the petrol allowance of a gallon to twenty-five miles.

(2) The minimum clearance to be 7 in.

(3) The petrol allowance of one gallon to twenty-five miles should be again the allowance in next year's race.

(4) I do not see that it would be more convenient to the Club or competitors for the cars to start by ballot instead of as they enter.

The New 20-h.p. Pilgrim Car built by the Pilgrim's Way Motor Company, Ltd., which is taking part in the Town Motor Carriage Competition.

The remainder I am quite in favour of, and especially that the rules for next year's Tourist Trophy Race should be settled without delay.—Yours truly,

J. PERCY DEAN.

### THE BLACKPOOL MEETING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When I received some time ago the programme for these races, I noticed several competitions, and particularly a series for various touring cars, the price of chassis under £300, £450, £650 and £900. After these there were events for any kind of touring car unrestricted as to price. My idea was that the last event was to compare the cars of all the previous classes competing together, and in entering my two Germain Chainless cars I had certainly no expectation of winning the award, but only to show what position they held amongst all the cars usually sold as normal touring vehicles such as one usually meets on the road.

When the event took place, I saw in the programme that instead of cars of all powers meeting together in order to establish a proportion of speed, only high-powered cars were entered, and that, in fact, the race was not one for touring cars unrestricted as to price, but for cars of a value of over £900, in which most of the cars in the last named class had entered again. Practically it was more of a contest for racing cars fitted with tourist bodies than a race for touring cars, the lowest power of all having a cubic capacity of about double that of the cars I entered. I do not think that the wishes of the organisers of the meeting have been understood in this competition, as the touring cars entered in this event were not at all the touring cars we meet on the road, but the majority of them very exceptional ones. It was too late for me to drop my entries and I let them start. Of course they could not make any show, as the proportion between them and the competing cars was

so big that comparison was impossible, but even then we were not last.

I think it is a great pity, as a race as I understood from the particulars issued by the committee would have proved very interesting, as some previous races in England and on the Continent have proved that the touring cars of very high power and price are not so fast in proportion as the good average car of moderate power. The expense in buying the former, and the expensive upkeep of same, especially as regards tyres, is not compensated by enough speed and hill-climbing capacity, the really good average touring car being that with a cylinder capacity of about 230 cubic inches and not the cars with enormous cylinders.—Yours truly,

T. MASUL.

### SOCIETY OF AUTOMOBILE DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am writing to you to know if any of your numerous readers can give me any particulars of the Society of Automobile Drivers. I first wrote the secretary in February or March last year. I received a form to fill up as to experience and other particulars which a Trade Union would require, also names and address of late employers, and references. These I forwarded without delay, together with an "entrance fee" of 7s. 6d., which was to include membership badge. After much delay I received the badge, but no rules.

During the last twelve months I have written numerous letters asking for rules and subscription card. In reply to one of my letters several months ago I received a type-written paper with "Objects of Society and Rules," and was informed that the membership card would be forwarded by the secretary.

I have written many times since then and always enclosed a stamp for reply, but have had no answer to any of my letters.

I have not even received a balance-sheet or a statement of accounts for last year.

A Caricature of Gabriel, the well-known driver of De Dietrich Racing Cars  
[Le Chauffeur.]

I made inquiries when in town recently, but could find no official of the society. I was told that they meet but rarely now.

I am convinced that there is room for a Mechanic Drivers' Society, and if this one does not fulfil its objects then another should be formed.—Yours truly,

A. M.

### MOTORING IN WALES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Envy, hatred, and malice seem to be the characteristics of the anti-motorists who write to the newspapers.

Fact is more forcible than fancy. A Local Government inquiry has been held in Llandudno to consider an application of the district Council for power to reduce the speed of motors in certain streets to ten miles an hour. Here was an opportunity for anti-motorists to prove their statements before a judicial inspector. What does the report of this inquiry forcibly impress on one's mind?

1. An enormous amount of motor traffic passes through Llandudno daily.

2. The district Council failed to mention that a single accident had ever taken place there.

3. The police declined to support the Council in their application for a reduced speed.

4. No ratepayers appeared to support the majority of the Council at the inquiry; but, on the contrary, the principal property owners, hotel-keepers, &c., instructed a solicitor to appear on their behalf to oppose the application.

5. Motor-cars cannot be the terror which many correspondents make them out to be in the face of these facts.

During this summer thousands of motors passed through the long straggling towns and villages of North Wales. The children have all been playing in the roads as of yore, and I have not heard of a single fatal accident to a child.—Yours truly,

H. GREY EDWARDS, M.D.

### A MASCOT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On Sunday last I drove my car from Clapham to Sevenoaks and back, and for the first time took, as an additional passenger, our black cat. I have often wished to try him as my mascot, but as he had never ridden upon any vehicle, and knowing how very timid cats are, I was very fearful that my pet would spring off the car and be for ever lost. He never gave us the slightest cause for anxiety and was soon reconciled to the road and its noises, and by the time we had passed through Bromley on our return journey had become positively blasé, sitting on back of front seat with his front paws resting first on my left and then on my right shoulder, and staring right before him as if on the look-out. Of course I quite intend he shall now accompany me whenever possible, and think you will agree that mine is the greatest curiosity in the way of motor mascots.—Yours truly,

C. M. HOLLOWAY.

### VALVE POSITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter in the last issue of the *M.C.J.*, from Mr. Anderson, re valve position, is very interesting. It is a well-known fact amongst motor engineers and designers that considerably more power can be obtained from an engine with the valves mounted in the cylinder head, or on top. We have only to look at the recent successes of the leading firms and we see it confirmed when put to the test.

Take, for instance, the marvellous speed of the Darracq, the Fiat, and it is remarkable that all the Daimler wins have been since they built their engines with inclined valves, which, if not on the top, anyway puts them as near over the piston as possible, with the advantage that they can use larger valves than would be possible on top.

One of the chief advantages besides those mentioned by Mr. Anderson is that the combustion space can be machined all over; this allows of a higher compression being used, without pre-ignition, than is possible with an engine having outside valves with rough corners to get hot in the ports. Although more power is so gained by the overhead valves, the size of the same is limited, and the exhaust valve is always constricted. Designers realise this and attack the problem in different manners. From what I can remember the 300-h.p. Deiahaye, and also the Hutton, used duplicate valves or four valves to each cylinder; the Fiat and Pipe get theirs at an angle, which allows of larger valves, and also give theoretically the correct and ideal shaped combustion space; but I doubt if in practice a dome combustion space, with a dome head to the piston, works out as well as a flat top.

We have only to follow recent steam practice and notice how the turbine has jumped to the front. The internal combustion turbine seems as far off as ever; at present our nearest approach to it is to increase the number of explosions per revolution, or, in other words, increase the number of cylinders; and, as many makers are contemplating marketing six or eight cylinder engines, this question of valve design is worth looking into. As mentioned before, if both valves are interchangeable, the exhaust valve, even with an abnormal lift, still leaves a small passage, which constricts the exhaust. But, for argument sake, it is admitted that an engine so made does give more power than one with the valves hung on the side; imagine how this additional power amounts up per cylinder when the engine has six or eight cylinders; further, suppose this constricted exhaust can be got rid of in an efficient manner (without duplicate valves), the extra power is again multiplied by six or eight as the case may be. I have designed and am constructing such an engine of 60-h.p. with eight cylinders, valves, sparking plug, water inlet and outlet, all on top of head; but the cylinders have perforated auxiliary exhaust ports, which are water-cooled.—Yours truly,

W. L. ADAMS.

### AN ALLEGED COLLISION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I beg to enclose copy of letter I have addressed to each of the magistrates who sat on the Bench of the Maidenhead Borough Police Court on Monday last when a summons was heard against my chauffeur for driving my motor-car to the danger of the public. The facts contained therein are undoubtedly sufficient to show that the alleged collision could not possibly have taken place, and if the conviction is allowed to stand it will be a gross miscarriage of justice.

Motorists seldom escape punishment, because the word of the prosecution is always accepted in preference to theirs, but in this case the facts speak for themselves and the position could not be altered if a hundred witnesses were to be called and swore that the collision did take place. In motoring many things are possible, but in this particular case the alleged collision was impossible.—Yours truly,

A. F. CALVERT.

COPY.

Sir,—On Monday, the 8th inst., my chauffeur, Frederick Earle, was charged at the Maidenhead Borough Police Court with driving a certain motor-car at a speed which was dangerous to the public, the summons having been issued because it was alleged that he had collided with a van in Bridge Road. As a result of the unreliable evidence given at the hearing he was fined £5 and £2 14s. costs.

I have taken some little trouble in this matter, and I think that.

after I point out certain facts you will see that if the conviction is allowed to stand it will be a gross miscarriage of justice. There are certain facts which prove conclusively that the evidence given by the witnesses for the prosecution is unreliable and untrue.

It will undoubtedly be admitted that the whole case turned on the question of a collision, and if it had not been alleged that a collision had occurred no summons would have been issued. I would first point out to you that no witness for the prosecution ventured to suggest that there was a scratch of any sort or kind on the van or the motor-car. I have had the car thoroughly examined and can say positively that if a collision of any sort or kind had occurred the car would have been damaged, because the mud-guards, which project over some distance on either side, being made of very thin light aluminium, would have doubled up before any solid part of the car could have touched the van. I believe one witness, in order to get over the difficulty of there being no marks, suggested that the rubber tyres must have collided with the van, but this also was impossible, as the rubber tyre could not have got at the van without first destroying about five inches of the flimsy mud-guard.

With regard to the question of speed, as is usual in motor cases, the witnesses called swore that the car was travelling at the rate of twenty-five to thirty miles an hour, but the gentleman who caused the summons to be issued, Rear-Admiral Fleet, said that the car was going at no speed at all; in fact, he said it was going very slowly. He fixed the speed at not more than three miles an hour, but I have no desire to accept his estimate any more than the other witnesses; I prefer to accept the word of the defendant himself, who said that the car was travelling at between six and seven miles an hour.

I hope you will consider these definite facts as sufficient evidence that the driver was not in collision with the van, and was not driving at a speed dangerous to the public. It is very seldom that in a motor case such clear facts as these can be produced to disprove the false evidence which witnesses can always be found to swear to, and therefore I hope you will see your way to revise your decision and cancel the endorsement on this man's licence, as if it is allowed to remain it would be sufficient to show that an endorsement is a farce, and no importance of any sort or kind can be attached to it by anyone attempting to judge the character of a driver.

In conclusion I have only to say, after examination of the car, if anyone can be produced to say that it was possible for a collision to have occurred without smashing up the mud-guards and otherwise damaging the car, I will not only readily pay the amount of the fine with costs, but will double the amount and hand the balance to any charity you like to name.—Yours truly,

A. F. CALVERT.

### MOTOR-CYCLING ON THE ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My attention has been called to a case where a motor-cyclist was summoned at Epping recently for riding a motor-cycle at an excessive speed. The Chairman of the Bench remarked, in imposing a fine of £10 and costs, that the roads were not made for racing. As the defendant, in giving his evidence, stated that he was taking part in a trial organised by the Auto-Cycle Club, I would like to take this opportunity of pointing out that in the various trials promoted by this club there is a very stringent rule which states that any competitor who exceeds the legal limit of 20 m.p.h., or who does not drive cautiously through towns and villages, is disqualified. I can assure you that this club will do its level best to put down inconsiderate driving or excessive speed in any of the competitions over which they have control.—Yours truly,

F. STRAIGHT.  
Secretary, Auto-Cycle Club.

### SUNDAY MOTORING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is now time that both makers and users of cars should pay profound attention to the general opposition the majority show to motors of all kinds, and unless something is done there will be some very severe restrictions placed on us. The many accidents and skidding of buses will most certainly have unwelcome measures at least proposed if not passed. Every day makers are turning out high speed cars which they know full well are destined to be a public nuisance, and the way these cars rush along the roads is a perfect disgrace, while if one does not get out of the way at once the driver and sometimes occupants will pass most uncomplimentary remarks in all known languages.

All cars should be made so that the legal speed cannot be exceeded. Many may think this a stupid proposal, but any hardship this regulation would carry with it will be nothing to what will be enforced, and when once the laws are made it will take a generation to get them modified. The motor racing man is a dangerous microbe, and should be treated as such; the speed cyclist brought the pastime into disrepute in the same manner. Mr. Morison's letter, I am afraid, speaks the mind of the public, and such a measure might slip through Parliament one of these times.

As a motorist I always proceed with due caution, as I cannot see the advisability of saving half an hour on the journey and wasting a day at the police courts, besides contributing to the county money-box. Buyers generally are waiting for the simple, reliable car within easy

reach of their pocket? What British maker will be the first to fill this need? I may add that I have a car of my own.—Yours truly,  
W. T. W., A. 1299.

### AUTOMATICALLY-REGULATED IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the inquiry of "J. R. C." in your issue of September 29th, I beg to say that I have found the system adopted by the Albion Motor Car Company on their cars to work admirably. My car has run about 35,000 miles, I estimate, and I have driven it perhaps 20,000 miles myself. I consider the automatic regulation gear a very valuable feature, more especially for a car that is driven much in traffic. One controls the speed by keeping his right hand on the governor lever while steering with the left, and the governor adjusts the throttle, the extra air valve and the time of ignition. One has thus only one regulating lever to operate to change the speed from say six miles per hour to twenty or twenty-four miles per hour on the highest gear. The absence of complication in the control of the car conduces, I believe, greatly to safety and comfort in driving, especially in traffic. I may add that the gear has given me no trouble whatever, beyond replacing some of the links after the car had run 20,000 miles or so. I would further say that I have not yet had occasion even to open the governor box.—Yours truly,

ARCHIBALD BARR.

### CONTROLLING ENGINE SPEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "S. C. G.'s" query in the last issue of the *M.C.J.*, your correspondent will find that the method already fitted to his car is by far the best, and is most generally used. In fact, I do not know of

The 16-20-h.p. Beeston-Humber Car which is taking part in the Town Motor Carriage Competition.

any car fitted in the manner stated, and think he would have a great difficulty in controlling his engine if he reversed the action of the pedal, especially when releasing his foot to apply the foot brake.—Yours truly,  
H. J. T.

**PALMER TYRES LOST.**—On Saturday or Sunday last, between the Eltham Road, Lee, and Sundridge Park, two 30 in. by 3 in. Palmer motor tubes, in spare tube bag, were lost by a London motorist. A reward will be given if returned to the London office of the makers.

**COVER FOUND.**—While out on the road near Northampton on September 27th ult., Mr. R. J. Woolley-Massey picked up an outer cover which had evidently dropped off a car. If the owner will write and give particulars to the Victoria Garage, Shakespeare Street, Nottingham, the same will be forwarded.

**A.N. 475 WRITES:**—"Would the gentleman who was driving his car round the bend into Stanstead on Sunday, the 23rd ult., at 12.30 p.m., accept my sincere thanks for having rendered assistance to my friend and myself after the severe collision we had, by sending the pony and trap along from the cycle shop in Stanstead?"

**ROUNDHAY HILL, DEVIZES.**—Referring to the photograph reproduced in the *M.C.J.* of the 6th inst., Mr. P. Frost, of Ringwood, writes that some time ago he drove a Delaunay-Belleville car up the hill with a party of officers of the Wiltshire Regiment.

**HIGH TENSION PLUGS FOR MAGNETO IGNITION.**—Replying to "F. T.," who inquired in the last issue of the *M.C.J.* as to where the E K plugs can be obtained, we learn that they are supplied by Messrs.

E. Kalker and Co., 141, Much Park Street, Coventry.

**BARDON CARS.**—Replying to a recent inquiry for spare parts of Bardon cars, Mr. G. Tufnell, the Lightning Motor Engineering Works, 527, Leytonstone Road, London, E., writes to say he can supply such.

## CLUBS AND ASSOCIATIONS.

### MOTOR CYCLING CLUB.

THE awards won by the members of the Motor Cycling Club during the 1906 season comprise 98 awards given to 60 members, the distinctions consisting of 3 challenge cups, 1 special trophy, 3 special gold, silver, and bronze medals with jewelled centres, prizes to the value of £28, 59 gold medals, 2 gold centre medals, 6 silver medals, 2 bronze medals, and a quantity of certificates for meritorious performances.

### THE CRYSTAL PALACE.

THE Crystal Palace Automobile Club's hill climb will be held on Saturday, October 20th. This competition will be confined to genuine touring cars, and the use of anything but ordinary petrol as fuel will not be allowed.

### BRITISH MOTOR BOAT CLUB.

It has been decided by the British Motor Boat Club to make a collection of lantern slides of motor-boats and motor-boating events. Eventually this collection will become of great value historically. The secretary will be pleased to receive slides from members or anyone else.

A paper on "Electric Circuits for Motor-boats" and on "The Construction and Use of Accumulators" will be read in January before the club by Mr. L. M. Waterhouse.

The Motor Ambulance recently supplied by Messrs. Dennis Bros., Ltd., to the Metropolitan Asylums Board.

### THE CYCLISTS' TOURING CLUB.

AFTER a long and animated discussion a meeting of members of the Cyclists' Touring Club at Caxton Hall, Westminster, on the 12th inst. adopted the resolutions necessary to confirm the decision of the special meeting at Newcastle last month, to broaden the basis of the club by admitting to membership all tourists, whether they toured by cycle or any other means. A postal vote of the whole membership resulted in 10,491 being in favour of the change and 2,231 against; and meetings in London and Newcastle in a large majority voted the same way. A show of hands gave in favour of the change 210, against 157; majority in favour 53. A poll was then demanded, and resulted as follows:—In favour 173; against, 156; majority in favour, 17.

The proposals now only require the sanction of the Court of Chancery, and the Cyclists' Touring Club ceases to exist, the Touring Club taking its place.

### PUBLIC MOTOR SERVICES.

**MANCHESTER'S OBJECTION TO MOTOR-OMNIBUSES.**—The Watch Committee of the Manchester City Council requested the Tramways Committee to take measures with a view to discontinuing the use of motor-omnibuses of the present type within the city at as early a date as may be practicable. The chairman of the Tramways Committee, seen subsequently, said that body had no desire to interfere with the decision of the Watch Committee. Their desire was to meet the wishes of the public. He added that the corporation had only three motor-omnibuses, one of which was not in use.

THE profits of the London Motor Omnibus Company, Ltd., after making ample allowance for depreciation, amount to £15,682, of which £4,000 is placed to reserve. The Preference dividend and an interim dividend at the rate of 10 per cent. per annum has been paid, and out of the remaining balance it is proposed to pay a dividend at the

rate of 10 per cent. per annum for the period from November 1st, 1905, to June 30th, 1906. The company commenced its service with five omnibuses ("Vanguard") on March 27th, 1905, and on June 30th, 1906, had 98 running, the daily average number of omnibuses in service throughout the period being 38½. The gross revenue and profits from all sources amounted to £124,938. The total number of passengers carried was 18,351,998. Premises have been secured in various parts of London, two of which (Albany Street and King's Cross) are thoroughly equipped and in full working order. Work on the remaining two (Camberwell and Shepherd's Bush) is being rapidly pushed forward, and should, before the end of the year, be in full operation. It has been considered necessary to have one large central repair depot, and with this object in view land has been secured in Walthamstow. Buildings are now in course of erection, and will be ready for occupation by the company towards the end of the present year. The garages and depot together, when completed, will accommodate between 300 and 400 motor-omnibuses.

THE practice which is followed by some motor-omnibus companies of paying their drivers and conductors by the number of trips made was strongly condemned on Saturday by Mr. Curtis-Bennett, who appeared at the North London Police Court to prosecute Henry A. Miller, driver of a "Pilot" motor-omnibus, for driving to the common danger in Stoke Newington Road. Mr. Curtis-Bennett stated that because of this practice drivers were anxious to go as fast as possible and often took great risks. In this case the magistrate said that there was not sufficient evidence that the omnibus was recklessly driven, and he discharged the driver.

THE inhabitants on the Hagley Road route of the motor-buses plying at Birmingham are to be invited to a public meeting of protest against the present inadequate service.

### AN INTERESTING PROBLEM.

IN our issue of the 15th ult. we invited our readers to send us the solution of the following problem taken from the 1905-6 calendar of Burlington House, Cambridge:—A cyclist and a motorist start at the same time from two places thirty miles apart; the car travels twice as fast as the bicycle. After meeting and resting, each starts back, travelling one mile per hour faster than they did on the outward journey; the cyclist reaches home five minutes earlier than the car does. What was the pace of each on the outward journey? The question has apparently been of considerable interest, as we have received quite a number of solutions. We append two, the first (A) being sent us by Earl Russell, and the second (B) by C. P., Oxford:—

(A.)

Let  $x$  = speed of bicycle in m.p.h.; then  $2x$  = ditto of car.  
In same time car does  $\frac{1}{2}$  (20 miles) and bicycle  $\frac{1}{2}$  of distance (10 miles).  
Return journey speeds are  $x + 1$ ,  $2x + 1$ .

Bicycle takes  $\frac{10}{x+1} \times 60$  minutes.

Car takes  $\frac{20}{2x+1} \times 60$  minutes.

$$\therefore \frac{600}{x+1} + 5 = \frac{1200}{2x+1} \quad \frac{1210x + 10x^2}{605 + 5x}$$

$$600 + 5x + 5 = \frac{1200}{2x+1} \quad 10x^2 + 1215x + 605$$

$$\frac{600 + 5x + 5}{x+1} = \frac{1200}{2x+1}$$

$$\therefore (605 + 5x)(2x + 1) = (x + 1)1200$$

$$\therefore 10x^2 + 1215x + 605 = 1200x + 1200$$

$$\therefore 10x^2 + 15x - 595 = 0$$

$$2x^2 + 3x - 119 = 0$$

By formulae

$$x = \frac{-3 \pm \sqrt{9 + 4 \cdot 2 \cdot 119}}{4} = \frac{-3 \pm 31}{4} = +7.$$

Outward pace of bicycle, 7 miles. Outward pace of car, 14 miles.

(B.)

Let  $x$  be the m.p.h. of cyclist on outward journey.

$2x$  will be the m.p.h. of motorist on outward journey.

Since they start 30 miles apart, they meet after going 10 miles and 20 miles respectively.

$\frac{10}{x+1}$  will be time in hours taken by cyclist on return journey.

$\frac{20}{2x+1}$  will be time in hours taken by motorist on return journey.

$$\frac{10}{x+1} + \frac{1}{12} \text{ (of an hour)} = \frac{20}{2x+1}$$

$$\text{or, } 2x^2 + 3x = 119$$

$$\left(x + \frac{3}{4}\right)^2 = \frac{119}{2} + \left(\frac{3}{4}\right)^2 = \frac{961}{16} = \left(\frac{31}{4}\right)^2$$

$$x = 7. \quad 2x = 14.$$

Cyclist's pace outward was 7 m.p.h.

Motorist's pace outward was 14 m.p.h.

## CASES UNDER THE MOTOR-CAR ACT.

### SECTION 1.—RECKLESS DRIVING.

THE maximum penalty of £20 and costs under Section 1 of the Act has been imposed on a motorist at the Uckfield Petty Sessions, the magistrates present being Mr. R. J. Streatfeild (Chairman), Mr. C. H. Corbett, M.P., Mr. E. G. Ramsbotham, Colonel Todd, Lieut.-Colonel Thompson, and Major R. L. Thornton.

At the Worksop Petty Sessions, Hardy Smith, of Langley Mill, was charged with recklessly driving a motor-car to the danger of the public, at Edwinstowe, on September 25th, and also on the same date and place with being drunk while in charge of a motor-car. Mr. Thornton, the presiding magistrate, said as it was a first offence defendant would be dealt leniently with. He was fined £3 and costs for reckless driving, and £2 and costs for being drunk whilst in charge of the car, and his motor licence endorsed.

During last week fines amounting to £111 were imposed by the Huntingdonshire magistrates upon eighteen motorists for driving to the danger of the public.

### SECTIONS 1 AND 6.—RECKLESS DRIVING AND FAILING TO STOP.

William Humm, a chauffeur, of Swansea, was summoned at Newport, on Saturday, for driving a motor-car to the danger of the public, near Chepstow, and for failing to stop although aware that an accident had occurred. Mr. Lewis Richards, J.P., the owner of the car, was summoned for aiding and abetting Humm in the latter offence. The case for the prosecution was that while a farmer named Leonard was driving with his family in a trap he had occasion to get out of the vehicle to adjust the harness. On looking up he saw a motor-car approaching, and as he had not time to get into the trap, he held up his hand for the car, which was about sixty or seventy yards away, to stop. The car, however, passed at a great speed, and his horse was frightened, and bolted. The occupants of the car, however, did not stop to render assistance. Immediately afterwards two other motor-cars came up, and the occupants rendered assistance to the police and the injured people. The police at Chepstow were also communicated with, and the car was stopped. Mr. Richards, for the defence, stated that until he saw the inspector at Chepstow he was unaware that an accident had happened. Eventually Humm was fined for driving to the danger of the public—£10 and costs. The other summonses were dismissed.

### SECTIONS 2 AND 3.—REGISTRATION AND LICENSING.

General Ceilan Milo Spitzer, an American, was summoned, at Marlborough Street, London, for aiding and abetting Eugene Ballon in driving an unregistered car and for employing an unlicensed driver. Mr. Huntley Jenkins, for the defence, said that the General, who was at present in America, had the car in question brought to England from a tour abroad, and before having it shipped for America, finding it necessary to ride in it once, told his driver to put on it an English registered number that he had formerly had on a car with the letters LC in front of it. The driver mistook his instructions, and only placed the letter LC in front of the American number, which he should have removed. With regard to the unlicensed driver, a licence had been applied for the day before the car was stopped. The General, not being aware of the stringency of our laws, had offended innocently, and considering that the driver of the car had already been fined, he asked the magistrate to impose only a nominal fine for a technical offence. Mr. Kennedy said there was no moral stigma attached to General Spitzer, who, however, had broken the regulations and would be fined 40s. and 2s. costs on each of two summonses.

### SECTION 9.—THE SPEED LIMIT.

At Newcastle on Saturday Alfred Peacock, Sunderland, was charged with having driven a motor-car at a speed exceeding twenty miles an hour at Wideopen on September 28. After hearing evidence the magistrates considered that the timing of a car could not be done accurately from one end of the trap only, and they therefore dismissed the case.

The Reigate county magistrates were engaged for several hours on Saturday hearing summonses against motorists for exceeding the speed limit, and fines, varying from £3 to £5 and costs, were imposed in a number of instances. Mr. Colin Defries, who was alleged to have travelled at the rate of thirty-four miles an hour, and against whom two previous convictions were proved, was fined £10 and special costs, and his licence was endorsed. Mr. George Iden, of Coventry, who claimed to have driven motor-cars more miles and to have been awarded more medals for designing cars than any other man in England, was ordered to pay £3 and costs.

On Saturday, at Doncaster, nine motorists were summoned, eight for exceeding the speed limit and one for driving to the danger of the public, at Askern, on the 4th inst. Fines were imposed in every case.

The motor timing expedition conducted by P.S. Waghorn on the Dicker Road on the 8th and 10th September resulted in eight speedy travellers appearing before the magistrates at the Hailsham Petty Sessions on Thursday of last week. Seven of them pleaded guilty, and were each quickly fined £7 and costs, the latter amounting to 8s. in some cases and a shilling more in others.

At Cowbridge Police Court, Mr. A. G. Thackeray, of Cardiff, was summoned for recklessly driving a motor-car through Cowbridge, and

was fined 20s. and costs. In opening his case for the defence, Mr. F. N. Shackel referred to a report which had appeared in the newspapers to the effect that the Bench had drawn the attention of the police to a motorist having driven recklessly through the town, and asked the police whether proceedings would be taken. Mr. Jenkins: Yes, the question came from me. Mr. Shackel contended that a prosecution should come from the police. On the Bench announcing the decision, Mr. Shackel asked the magistrates to make the fine 21s. in order to give defendant an opportunity to appeal, but this they refused to do. Mr. Shackel said he must press his point. This was a case in which they ought to have a chance of appeal. It was the most irregular case in his experience. The prosecution was brought by the Bench and decided by them.

On Saturday, at Doncaster, nine motorists were fined for exceeding the speed limit.

### NO LIGHTS.

At Wilmslow, Edwin Williams, Lord Stanley of Alderley's chauffeur, has been summoned for not showing his numbers at the rear of the car. The police found him on the road near Chelford without lights. They were unable to see the numbers, but they knew it was his lordship's car. The defendant said he did not know his lights were out. He was fined 10s. and costs. A second chauffeur has been similarly summoned, the fine in his case being 20s. and costs. The magistrates had no option in endorsing the licences in both cases.

## HIGHWAY CONTROL.

THE members of the Society of Motor Manufacturers and Traders on Wednesday of last week gave a banquet at the Hotel Cecil, London. Mr. S. Straker presided, and about one hundred and fifty gentlemen were present. After the toast of "The King" the chairman said that they wished to discuss the question of "Highway Control and the Dust Problem." He declared that the question of road control would largely affect the destinies of motorism. As the London

A 24-h.p. Ader Car with side-entrance body, built by the Waterloo Motor Works, London, S.E., who propose to use the vehicle for hire work, for which purpose they are having a Cape cart hood made for it.

Chamber of Commerce had said, the time had arrived to secure some efficient and economic system of maintenance of high roads. He believed that the State should establish a High Road Department. Whatever the incidence of the tax on motor-cars there would be a good deal of money paid to the Exchequer, and that money should be spent in the improvement of the trunk roads.

The Hon. A. Stanley, M.P., declared that the people of the country had arrived at the conclusion that the roads of the country were meant for traffic, and not as play-grounds. Of course, motorists did not wish to inconvenience those living on a road, but surely a road was meant to secure a means of rapid communication? Roads must adapt themselves to the traffic on them, and motor traffic had come to stay.

Mr. E. P. Hooley, Road Surveyor of the County of Nottingham, declared himself in favour of a proper system of road maintenance. Patching should be done away with; more coating was necessary and on a scientific basis. He would use tar material all over it and through it, and not only on the surface.

Lord Montagu paid tribute to the work of the county surveyors in the maintenance of the roads, declaring that the good road was also the cheap road. He regretted that there was not in the Bill of 1888 a provision that a certain amount of the grant in aid should be applied to the main roads, and he would like all taxes due to the user of the high roads to be applied to the maintenance of those roads. Dust was the great enemy of the motor-car at the present day, many people suffered from it, and motorists should remember that, for such people had a great electoral power. A dustless road was, taking all into consideration, the most economical road.

The Marquis of Winchester declared that the Commission sought to bring the motorists under the ordinary laws of the country and to avoid putting them in a special category. Speaking personally, he could see no reason for a differentiation in connection with the fines paid by motorists so far as the attribution of the funds derived from them was concerned. Much depended on the systematic making of

roads, and too many roads were not built for the traffic they now had to carry. With the Commission, he believed in the creation of a central authority for our main roads. Were it not for the dust the public would find little fault with the motor, which brought some brightness into public life, for the motor did much for the tourist movement, and meant increased prosperity for remote localities.

Further reference to the subject will be found in our Comments on another page.

### ROAD REPORTS.

PERTSHIRE.—Recommendations with regard to the closing of certain roads to motor-car traffic and reducing the speed of automobiles in the vicinity of schools to ten miles per hour have been approved by the Perth County Council.

### THE MOTORIST'S TEN COMMANDMENTS.

WE cull the following from a Canadian contemporary:—

1. Thou shalt not scorch on the public roads or challenge thine enemy to a race on same.
2. Thou shalt not boast of thy mileage or of the tyres, for pride goeth before a puncture.
3. Thou shalt not gaily pass another by and refuse assistance, for thou may be in a like condition some day.
4. Remember thy sparking plugs and keep them clean and thy batteries charged.
5. Thou shalt not neglect to work for good roads so that thy going shall be smooth.
6. Fill thy tanks with petrol before starting on a journey so that you may not be stuck in the woods miles from home.
7. Honour an honest repairer, but keep a check on the chauffeur, so that thy automobile be not abused.
8. Do unto the drivers of other vehicles as you would have them do to you.
9. Thou shalt not borrow thy neighbour's pump, nor his jack, nor his tube, or anything that is thy neighbour's.
10. Thou shalt not try to improve on the work of the manufacturer, because they that take lessons from schools of correspondence are oftentimes shy of knowledge.

### THE LIABILITY OF REPAIRERS.

At Chester County Court, before Judge Moss, Mr. Stanley R. Smith, of Kelsall, sought to recover £5 odd for damages sustained by the alleged negligence of Mr. W. H. Monk, dealer, of Chester, or his servants. Plaintiff's case was that the car in question was sent to the defendant to be overhauled and repaired. The gear of the car was sent to the makers and repaired by them. It was returned to Chester, but was sent back by defendant. The makers returned it, replying that they had made the gear perfectly good. The gear was replaced in the car. Plaintiff did not use the car much between February and June, but on June 5th he was in the vehicle on his way to Prestatyn, when the shaft of the gear broke suddenly on a hill near the town. The car began to run back, and a serious accident was averted by the plaintiff only with great difficulty. The car was towed into Prestatyn Station and brought home by train. An expert who was called in said that the accident was solely due to neglect of proper adjustment of the gear when replacing the parts of the car together. If the ball-race had been properly adjusted it would have been impossible for the shaft to have worn away as it had. Plaintiff only claimed his out of pocket losses.

For the defence, Mr. E. Brassey urged that the specialists who had given evidence on the other side were business rivals, and had only seen the car after the accident. As one of them admitted, their opinion would have been of more value had they seen the car before the accident. His client was responsible only for the assembling and reassembling of the parts of the car. He neither guaranteed nor took any responsibility whatever for the work done by the makers, who had not carried out their instructions in repairing the car, and its dangers were pointed out by defendants to the plaintiff when it was returned by the company. His Honour, finding that the accident was caused by a faulty adjustment of the gear, gave judgment for the plaintiff with costs.

### MOTOR-CAR ACCIDENTS.

THE Right Hon. Sir J. H. A. McDonald, who was an occupant of a motor-car which met with an accident a few days ago, at Garstang, near Preston, writes to say that no one was badly shaken, that the journey was not resumed to Glasgow, and "that the whole thing was an ordinary sideslip, which, unfortunately, put the wheel sideways against a high kerb."

A MOTOR-CAR, driven by Mr. Outram-Cleveland, of Maidenhead, in attempting to pass an electric tram-car in Uxbridge Road, on Monday, crashed into another coming from the opposite direction. The motor-car became sandwiched in between the two tramcars, both of which were

badly damaged, whilst the motor-car was wrecked, and had to be towed to a neighbouring garage.

AN extraordinary motor-car accident occurred on Tuesday at Merstham, when Police-Sergeant Hardy was, with Constable Carr, knocked down near the entrance to Gatton Park. They were patrolling the road about an hour after midnight, when suddenly the lights of an approaching motor, driven by Mr. Adams, of West Kennington, flashed upon them, and before they had time to get out of the way the car ran into them, throwing them both heavily to the ground. Mr. Adams conveyed them to a doctor, and after receiving treatment they were conveyed to their respective homes.

### POLICE TRAPS.

NEAR Crewe is a police trap worked by police officers stationed three miles apart.

THERE is a police trap (one furlong in length) between Gunnersbury Station and Gunnersbury Lane, near Kew, being worked by a sergeant in plain clothes standing at the London end, the other plain clothes man being at the church near Gunnersbury Lane, with a uniformed constable on the opposite side of the road.

ON the Dicker road, Hailsham, is a carefully worked police trap, in which one of the officers gets behind a hedge, making observations through a hole therein.

WORTHING has at least two frequently worked traps, on the Brighton road and the Findon road respectively.

IN the Kennington and Brixton roads there are police traps—all leading to the police court at Lambeth.

MOTORISTS should be cautious when driving through Kensington, as police traps are again on the following roads:—Kensington High Street, from the Royal Palace Hotel to Holland Park, and likewise from Holland Park to Addison Road Railway Bridge.

THERE is also a trap in Earl's Court Road, and everyone coming through this Royal borough should drive slowly.

A MOTORIST warned of a police trap on the main road between Lewis and Eastbourne reports that he found it at the cross road leading to Berwick, seven miles from Eastbourne. The usual East Sussex electric timing arrangement worked both ways over 220 yards. Practically there was no traffic on the cross road on Sundays, and no houses near.

WE understand from Mr. E. Lamb, the secretary of the Stanley Show, that entries for the forthcoming show are coming in very satisfactorily. The office address is 19, Southampton Buildings, Chancery Lane, London, W.C.

HER Royal Highness Princess Louise (Duchess of Argyll) visited Leeds recently and opened a new high school at Headingley. The royal party, who had spent the night at Temple Newsam as the guests of the Hon. Edward Wood, drove through the town in four motor-cars, the authorities believing them safer than the usual carriages drawn by horses, which might take fright in the crowded streets. As a result the crowd were considerably disappointed in not having the usual pomp and circumstance of a royal visit, and Princess Louise was quite unrecognised until the Lord Mayor stepped forward to welcome her at the town hall.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case; otherwise no liability will be accepted.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

# THE Motor-Car Journal.

VOL VIII.]

LONDON, SATURDAY, OCTOBER 27, 1906.

[No. 399.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## Our Commemoration Number.

IN a few days the tenth anniversary of the emancipation of the Motor Car will be celebrated by a series of runs and festivities that will demonstrate the remarkable progress that has been made during the last decade. Following the custom of the MOTOR CAR JOURNAL and its ancestor, *Industries and Iron* and the *Mechanics' Magazine*, we have devoted practically the whole of our present issue to a record of the progress that has been made. In 1896 *Industries and Iron*, from which the *M.C.J.* evolved, published a Special Issue, which formed a landmark of progress, and again, at the interval of ten years, we give a comprehensive survey, which will be found equally useful as setting forth an important chapter in the history of the movement.

In the following pages most of the usual features of the *M.C.J.* have been seriously curtailed or wholly suspended in order

that our record of the remarkable progress of the automobile movement during the last decade may be adequately chronicled. The history of the advance made during the past ten years is preceded by a review of the pre-Victorian period, as well as of the years when the "man with the red flag" regulated the pace of motor-cars. The Reminiscences of the historic run to Brighton on November 14, 1896, and the early experiences will be of interest to those who have only known the Motor Car in the days of its reliability. Then follows a complete account of constructional progress, in which we analyse the leading features of each succeeding year to the present time. The various movements that have arisen to popularise automobilism are also referred to, along with the incidents and Trials that have been comprehended in ten years of greater activity than have been given to any other industry.

### COMMENTS.

THE Automobile Association is the newest and probably the most active of the organisations devoted to the protection of motorists. This it does without recourse to the conventional legal methods; it rather seeks to keep motorists from courts in preference to assisting them therefrom when they get within legal clutches. From many of the southern roads it has driven the obnoxious police trappist, and it has rendered the "controls" very unprofitable on others. Anticipating trouble in the north owing to the number of fast cars on the road to Blackpool, the Automobile Association recently sent some of its best

men north to look after the interests of motorists going that way. They were veterans of the Portsmouth and Brighton roads—men who had time and again defeated the best laid schemes of Marks and Jarrett, and as they went north they looked forward jubilantly to a keen contest with the Northerners. They came back disappointed, for the Lancashire police took a sensible view of their duties. Constables there were, certainly, but they were stationed on the road in uniform, with the view of checking speed rather than encouraging it. Plain clothes men were hard to find, and traps were absent. All this puzzled the ardent scouts from Surrey, until a Lytham inspector threw light on the subject. As one of the Association's patrols was leaning disconsolately on his bicycle, and voting the whole business "too slow," the inspector addressed him kindly. "What are you doing here, my lad?" The patrol explained briefly how he was looking after the interests of motorists. The inspector heard it all quietly and then remarked, "You're doing good work here, my man; it seem's we're not wanted. I'll take my men off the road."

#### The Views of the Councils.

No fewer than twenty-seven local authorities were represented at a conference of Cheshire urban and rural district councils, held at Chester recently, the gathering being specially summoned to consider the question of automobile traffic and its regulation according to the proposals of the Royal Commission on Motor Cars. A variety of proposals were made; many of them peculiar and absurd, some fairly reasonable, having regard to the source. The idea of taxing motor-cars according to horse-power was promptly scouted by the good people of the conference, while the proposals that were endorsed were nothing more remarkable than approval of the present speed limit of twenty miles an hour, and the idea of reducing this to twelve in dangerous places. In fact, the whole tone and attitude of a conference really representative of rural opinion in a county familiar with the subject was in pleasant contrast to the strict line of fierce opposition that had been anticipated.

#### In Hospital Service.

DESPITE the undoubted inconvenience of the motor-bus to hospitals in towns and the irritation it causes to those in hospital in rural districts, the motor-car is doing a beneficent work in many places. At Belfast, Glasgow, and London the motor-ambulance is of acknowledged value in dealing with urgent surgical cases, and at the military convalescent home at Osborne stretchers have been especially designed for carriage on motor-cars. The annual report of the institution, published in the form of a White Paper on Monday, makes especial note of the value of the motor-car and its new stretchers in hospital work. Patients can be removed from their rooms in London to their quarters at Osborne without leaving the stretcher. The secretary of the Essex and Colchester Hospital has found

another use for the automobile, several owners of cars in the district having been invited to place their vehicles at the occasional disposal of ladies collecting funds for the institution, and a thorough canvass of the locality is to be made in the interest of the hospital. Such would otherwise be impossible.

#### "The Biter Bit."

DISTINGUISHED among the critics of motorists in the House of Commons is Mr. Cathcart Wason, whose antipathy to speed has been evidenced on several occasions. When the Secretary for Scotland conducted an inquiry in Ayrshire into the local application for a restriction of the speed of motor-cars on certain roads in the country, Mr. Wason, M.P., was a vigorous supporter of the proposal, which ultimately found official acceptance. We are sorry that this persistent Parliamentarian has lately fallen a victim to his own advocacy, for, as related in our Motor Car Cases this week, a chauffeur driving a car through the village of Ballantrae at a speed greater than ten miles an hour has been summoned, this being one of the localities where the reduced speed limit is enforced. It was alleged that the car was driven at twice the prescribed speed, which, in the view of Mrs. Wason—wife of the M.P.—was nothing terrible at all. We understand that at the time of the contravention the vehicle was on hire to Mr. Cathcart Wason,

cars and motor-cycles were involved, as well as in the number of cases of personal injury. While motor-bus mishaps have naturally increased owing to the multiplication of the number of vehicles in service, we note an increase, too, in the accidents caused by mechanically-propelled tramcars. A decline in both sections of locomotion may be looked for as the experience of the drivers increases.

#### Overhanging Trees.

At the risk of appearing unduly insistent we have always emphasised the necessity for local authorities to see that they do their duty in having trees carefully lopped when their branches overhang the roadway at corners in such a way as to obstruct the view of drivers, whether of horses or motor-cars. At length we regret that a case has occurred which serves to give added strength to the warnings so frequently uttered. A young fellow travelling to the City from Fulham by motor-bus was on the top of the vehicle. When outside the new South Kensington Museum one of the branches of a tree struck him in the face and sadly injured him. The driver of the vehicle declares that the trees in that neighbourhood overhang the roadway about ten feet in many places, and it has also been stated that the outside passengers push the branches away with their hands. The case has been before the Brompton County

The Town Carriage Competition. The Vehicles Starting on the Trial Run.

and that Mrs. Wason was an occupant. Possibly his wife may be able to prove to her spouse that his attitude towards automobilism has been unreasonable in the past, and that he should mend his ways in the Parliamentary Session upon which we have entered.

#### Accidents.

How those Scotch M.P.'s enjoy heckling the authorities with regard to automobile matters! Mr. Cathcart Wason's zeal is well known and Mr. Galloway Weir's curiosity equally persistent. We have just seen a report from the Home Office of accidents in the Metropolitan Police district during July and August last as follows:—

	July.	August.
Caused by motor-cars (including motor-cycles) ...	539	328
Involved personal injury ...	178	134
Proved fatal ...	6	6
Caused by motor-omnibuses... ..	361	436
Involved personal injury ...	74	75
Proved fatal ...	1	5
Caused by mechanically-propelled tramcars ...	286	317
Involved personal injury ...	105	121
Proved fatal ...	1	2

There is a gratifying decrease in the accidents in which motor-

Court, when the jury added a rider to their verdict to the effect: "We regret that any authority should permit trees to grow or project or overhang highways wherein decked vehicles are carrying passengers."

#### Motoring in Ireland.

THE reception, so genial and sportsmanlike, which the Irish people gave to motorists in the famous days of 1903, when the great International event caused money to circulate in the Emerald Isle with a freedom rarely witnessed therein, has by no means evaporated. Wherever circumstances have permitted the Irish people have become motorists themselves, and Dublin, Belfast, Cork, and Waterford are all centres of the industry and pastime. Now we learn that Limerick has advanced so well as regards the automobile that a club has been established there. Nearly thirty motorists have become members, and affiliation to the Irish Automobile Club and the Motor Union will take place in due time. Mr. J. E. Goodbody is the hon. secretary, and the committee consists of Sir Thomas H. Cleeve, D.L., Messrs. A. W. Shaw, J.P., J. Horan, A. Blood Smyth, T. D. Atkinson, D.L., and J. P. Goodbody. We wish the Limerick A.C. a long and pleasurable career of usefulness.

## CONTINENTAL NOTES.

### A Swiss Hill-Climbing and Consumption Test.

Under the auspices of the Swiss Automobile Club a hill-climbing competition was held on the 14th inst. on the Marchairuz Hill, near Geneva. The contest was over a distance of 6.1 kilometres, and of the twenty-nine starters the best time was made by M. O. Pfister on a 12-16-h.p. Peugeot car. A fuel consumption trial was run off by the same club on the 16th inst. over a 130 kilometre course. Twelve vehicles started, of which six finished within the time allowed, the winner being M. Ernst, with a car of his own construction, and fitted with an Aster engine.

### A Touring Car Race in Germany.

Arrangements are in hand in Germany to organise an international touring car race over a distance of from 350 to 400 kilometres for June next. It is proposed that the event shall be run off on the Taunus circuit, on which the Gordon Bennett race was held in 1904, and that the competing vehicles shall be fitted with engines of a maximum cylinder capacity of eight litres.

(maximum 20 kilometres per hour), (5) freedom from breakdown (6) accessibility of mechanism, (7) ease of control, and (8) protection of the chassis from dust and mud.

### The Dourdan Speed Trials.

The autumn speed trials on the level at Dourdan, France, on Sunday last, aroused considerable interest, and mark a further conquest against Father Time. In the flying kilometre a new record was established by Mr. A. L. Guinness, whose 200-h.p. eight-cylinder Darracq had been quickly brought from Blackpool, and which covered the distance in 20 sec., equal to 112½ miles per hour, Villemain on a Clement Bayard being second in 26 3.5 sec. in the general classification and first in the 650 kilog. car class, in which Mr. Huntley Walker competed on his 80-h.p. Darracq, but was disqualified owing to his vehicle exceeding the weight limit. There was a large number of competitors in the touring car classes.

### France and Motor Racing.

The A.C.F. having invited the members of the motor trade to give their views as to the question of organising a race next year, the members of the Chambre Syndicale de l'Automobile last

Mr. A. Huntley Walker starting on his Darracq at Dourdan.

### International Automobile Exhibition.

It is announced that exhibitors, members of automobile clubs, and others who intend to visit the forthcoming Paris Salon will have the advantage of special rates on the principal French railways.

### A French Military Motor-Vehicle Competition.

At the instance of the French Minister of War, the A.C.F. is organising a competition of military motor-vehicles, which is to be held towards the end of next month in conjunction with the Paris-Nice-Paris reliability trial of 1907 models. There will be three classes, viz.—(1) wagons for loads up to 1½ tons, (2) ditto over 1½ tons, and (3) vehicles capable of carrying over fifteen passengers. The competing machines will start from Paris on November 19th for a run to Marseilles, which is to be made in eight daily stages, and after a day's exhibition will start on the return journey to the capital, which is scheduled to be reached by December 5th, the total distance being 1,558 kilometres. The awards will be made by a system of marks for (1) regularity of running, (2) proportion of total weight to useful load carried, (3) fuel consumption per ton-kilometre, (4) average speed

week held an important meeting, at which a decision in favour of the continuation of an annual race was arrived at. The Marquis de Dion suggested the establishment of a private and enclosed permanent track on which the contest could be held without danger to the public, and although some manufacturers do not view the suggestion with favour, considering that the maintenance of a permanent circuit will necessitate more than one race per year, a resolution in favour of the idea was adopted.

### Miscellaneous Items.

The Morris Company are, it is announced, bringing out a 50-h.p. six-cylinder car for the 1907 season.—France having won the three big races of 1906—the Grand Prix, the Circuit des Ardennes, and the Vanderbilt Cup—the “Auto,” of Paris, is organising a banquet for the 12th November to celebrate the triple victory.—It is proposed to hold a 500 kilometre touring contest on the lines of the Herkomer Trophy competition in Italy next year.—The Touring Committee of the A.C.F. has decided to continue to recommend that Switzerland be boycotted by motor tourists on account of the anti-motoring regulations which are still in force in the country.

MESSRS. BROWN BROTHERS, LTD., have received an order from the Jaskan Miniater, Kathiawar, India, for two 3½-h.p. "Brown" motor-bicycles, complete with side cars, for their Highnesses the Princes of Kathiawar.

THE Star Engineering Company are bringing out a six-cylinder car for the 1907 season.

MESSRS. MANN AND OVERTON, LTD., inform us that the Richard-Brasier cars will be known in future as the "Brasier," the word Richard being dropped.

THE Daimler Company have had the honour of receiving a further order from H.R.H. the Princess of Wales for a 1907 chassis. The car will be on view at the forthcoming show at Olympia on the stand of Messrs. Mulliners, who are supplying the body.

THE Automobile Association did much useful work for the Blackpool race meeting by means of their scouts on several roads in Lancashire, Col. Bosworth, Mr. Walter Gibbons, and the secretary, Mr. Stenson Cooke, journeying down to superintend operations.

The illustration reproduced above depicts the novel Motor Delivery Van just completed by the British Automobile Commercial Syndicate for Messrs. Worthington. The body, which is of registered design, is mounted on a 20-28-h.p. Spyker chassis, geared very low for transport work.

It must have been a satisfaction to all concerned, that the Blackpool race meeting was carried through without any serious accident. A detachment of the St. John Ambulance Brigade was on duty on both days, but, so far as we could learn, their services were not required. In fact, the only accident we heard of was a collision on the Saturday morning between two cars, which had no more serious results than a broken road-wheel. The usually inevitable dog on the track, too, was conspicuous by its absence, its place being taken by caps and goggles, which the high wind blew off the drivers' heads and carried along the course.

WE are officially informed that the title of the Brotherhood-Crocker Motors, Ltd., has been altered to the Sheffield Simplex Motor Works, Ltd. In announcing the change the makers of the Brotherhood car write us that their manufacturing facilities have proved insufficient to enable them to cope with the demand for their cars, and new and enlarged works, now nearing completion, have been established at Tinsley, Sheffield, where all parts of the car will be made. Messrs. Brotherhood and Crocker are not now interested in the company, but the cars, as heretofore, will be designed and produced under the personal supervision of the general manager, Mr. Percy Richardson. The vehicles produced at the new works will be named the Sheffield-Simplex, whilst those cars that have already been constructed and that are fitted with the engines, gear-boxes, &c., made by Mr. Peter Brotherhood, will still retain the name of Brotherhood. It is hoped to begin deliveries of the new Sheffield-Simplex car early next spring.

## HERE AND THERE.

OF interest to the trade section of our readers is the announcement that the Deasy Motor Car Manufacturing Company, Ltd., is now prepared to appoint agents both at home and abroad for the sale of the new Deasy cars.

MR. W. GRAINGER has a well-fitted garage and motor repair shop at 121, Shooter's Hill Road, Blackheath, S.E.

TURNER'S MOTOR MANUFACTURING COMPANY, LTD., have recently despatched a 10-h.p. Turner-Miesse steam car to Capt. G. E. Smith, R.E., the Director of Surveys, Mombassa, British East Africa, who states that it is the only motor-car in that portion of the globe.

THE Prested Miners' Lamp Company, Ltd., have sent us a complete set of their electric ignition outfits, including coil, accumulator, and plug, all bearing the well-known name "Prested." We hope to give them a trial at an early opportunity.

OWING to the short notice given for the town carriage competition, Messrs. J. E. Hutton, Ltd., were unable to finish the special new car which had been expressly designed by M. Berliet for London requirements as well as they could wish, and the vehicle was withdrawn from the competition.

ONE of the latest six-cylinder cars to be put on the market is the "Brown," which has just been introduced by Messrs. Brown Bros., Ltd. We had a run out on the new vehicle, which is of 40-h.p., the other day, and, as we expected, found it both speedy and quiet as well as excellent hill-climber. We hope to fully describe the car in an early issue.

THE rapid growth of the motor industry in this country is indicated by the number of licences issued by Inland Revenue Commissioners as follows:—1899-1900, 230; 1900-1, 198; 1901-2, 334; 1902-3, 664; 1903-4, 1,178; 1904-5, 2,261; 1905-6, 5,443. In 1898-9, 61 were issued, 75 in the preceding year, and only 16 in the twelve months ended 1897.

THE Continental Tyre Company is issuing a leaflet in which motorists anxious to see their tyre bills show a decrease are urged to ask their drivers how many pounds pressure they have in the tyres. "If they do not have 60 lbs. for 3 in. and 70 lbs. for 3½ in., 80 lbs. for 4 in., 90 lbs. for 4½ in. and 5 in., you should not expect good service. Don't blame the tyre maker. He cannot watch your driver."

A NEW car is being placed on the market by the Riley Cycle Company, Ltd., Coventry, who have for the past few years confined themselves to the manufacture of tri-cars. The new vehicle is a 9-h.p. two-cylinder, and during the past season has been very successful in winning several hill-climbs, including Skegness, Kettleby and the Crystal Palace A.C. It is interesting to note that this company made their first four-wheeled car in 1897, and it is still running in Belfast.

THE efficiency of the small Clement-Talbot engine caused so much interest at Blackpool, that Mr. T. H. Woollen, of the Clement-Talbot Company, has had the cylinders officially measured by the engineer of the A.C.G.B.I., who reports as follows:—"I have to-day examined and measured the bore and stroke of the Clement-Talbot car, licence No. A. 2366, chassis No. 201, type 4 V.B., No. of engine 4206, which won at Blackpool, Event 4, standing mile for cars the chassis price of which is not more than £450; and made the fastest time in Class A at the Crystal Palace Club hill climb. I beg to state, after carefully measuring same, I find the bore to be 85 mm. and the stroke 120 mm."

UNDER the name of the "Shaftometer," the Direct-Reading Instrument Company, of George's Square, Halifax, have lately introduced a very sensitive direct-reading level for lining-up shafting, machinery, &c., which should be of interest to motor-car manufacturers. The instrument has a rigid gun-metal base 15 in. long, and a glass tube 12 in. long. The latter is ground internally to ensure an even bore and correct curvature. Brass scales on each side of the instrument run from end to end of the tube, and are graduated with divisions about 1-8 in. long, each division representing a difference of level of one-thousandth of an inch per foot run. The position of the bubble thus indicates at once any variation in level in the surface being tested.

# Ten Years' Progress

## OF THE

# Motor Car Movement.

INTRODUCTION.—THE PRE-VICTORIAN ERA.—FROM 1837 TO THE EIGHTIES.—THE DAY OF EMANCIPATION.—THE DEVELOPMENT OF THE MODERN MOTOR CAR FROM 1885 TO THE PRESENT DAY.—THE HISTORY OF THE AUTOMOBILE MOVEMENT IN THE UNITED KINGDOM.—TEN YEARS OF MOTOR CAR RACING.—SOME EARLY EXPERIENCES, &c.

### INTRODUCTION.

IT is difficult to realise that ten years have elapsed since automobiles were accorded the common rights of the highway, or, to put it more correctly, re-admitted to those rights, of which they had been deprived during sixty years of obstinate obscurantism. Progress has been steady during that period, even if less rapid than was anticipated by the enthusiasts of ten years back, and may well justify a retrospect of the chief directions it has taken, which in its turn will indicate with reasonable probability the lines it may be expected to follow in the near future. Those who were at Brighton on the occasion of the memorable run in 1896 will remember the dozen or so of travel-stained vehicles that completed the arduous and perilous journey, a representative collection of the best productions of the time, and can hardly help being struck by the applicability of most of the laws of biological evolution to the process which out of these has given us the cars of to-day.

No remarkable inventions or discoveries (daily announcements notwithstanding) have revolutionised motor construction, such as have occasionally occurred in other fields of enterprise; and while some types of cars have, after more or less successful careers, become extinct, it is curious to reflect that the various parts and organs of the typical modern car (if we except ignition, and, to some extent, cooling devices) are represented in much the same general order in the Daimler of 1896, not to say in the Panhard of 1891. The probable reasons for the fate of the extinct types are not always as clear as might be wished, though it is fairly certain that belt-driven cars—at one time a popular and promising class—were killed by the increase of powers above the limit that a belt could economically transmit in the limited space available, added to the tendency of the small car (as of the small human) to ape its superiors. The tricycle died chiefly, doubtless, of discomfort, while the Bollée, strictly to be included therewith, suffered from defects of detail and the evils of a single driving wheel, and

is endeavouring, with uncertain success, to rise metal morphosed from its ashes in the shape of the modern tri-car. The bicycle, now ubiquitous, was (experimental machines excepted) only represented by the weird Wolfmüller and the elusive Pennington, in both of which the question of piston speed had been lost sight of in the supposed advantages of a direct drive, and remained for some years outside the domain of practical politics; while the particular position and sphere of the electric car was still undetermined.

Taking, then, the most successful and popular cars of that date, what, one may ask, are the points in which advance is most manifest? First and foremost, of course, the enormous increase of power in relation to weight, due primarily to improved design, as far as the elimination of unnecessary metal is concerned, next to higher compressions and piston speeds, with the more liberal valve proportions necessary therefor, and finally to improvements in materials, in the adoption of which more than in anything else the way was shown by Continental constructors. The net result of these various factors has been the reduction of weight from about 50 kilos. per h.p. to a figure approaching five in the case of the larger car engines, and even less in the case of certain special designs. More important even has been the increase of reliability, and this is due rather to the attention paid to numerous minor details than to any notable innovations. Broken and stuck valves, leaky water joints in cylinder, overheating and pump troubles, burner defects, and weaknesses in the electrical ignition system, these were the cause of 90 per cent. of the early troubles, and they have been largely banished by care in constructional detail—alterations in proportion rather than in radical design. Moreover, the small margin of power then at the disposal of these, which nowadays would mean only a slight diminution in speed, spelt utter stoppage.

More power, indeed, we do not now require, but possible improvements in detail, more particularly those which conduce

to accessibility, are innumerable. The days when the passengers, luggage, and seats—and often, for convenience, part of the body—had to be carefully removed from a car and placed by the roadside preparatory to making a small adjustment, are past; but it ought no longer to be necessary to detach a radiator, crank chamber base, and half-time gearing, and, moreover, to sling the crankshaft, in order to tighten a loose big-end bolt, or even in some cases to get any first-hand information about its condition; nor should it be needful to dismantle a whole gear-case to re-leather a clutch. Points like these, however, are daily receiving more attention. As regards the important question of prices, it is strange how little advance, from one point of view, has been made. The cheapest practically useful car of to-day does not differ much in price from the similar car of 1896; it is, of course, faster and more reliable, as are all its fellows, but it is doubtful if it will be more durable; while the most expensive car of the present time is naturally, perhaps, considerably higher in price than the best of that time. The period has probably not yet arrived

## THE PRE-VICTORIAN PERIOD.

THE early years of the Twentieth Century have witnessed the revival of interest in locomotion on the roads which promised well in the corresponding youth of the Nineteenth, but which was then diverted by the railroad or suppressed by the prejudiced interests of the turnpike people. Had the progress that had been attained in connection with the conveyance of goods and passengers on the roads in the pre-Victorian days been allowed full development, the history of the past decade would have been very different to that recorded in the pages that follow. The story of the early efforts has been retold so often that it is almost as familiar as the voyage of the Ark; but its main incidents may be recalled in order to complete the cycle of automobile progress.

National pride glories in the fact—interesting historically but of no practical value in the matter—that an English patent for a “horseless carriage” was taken out in 1619 by Ramsay

The James-Anderson Steam 'Bus built about 1829.

when standardisation can be taken full advantage of in the production of the very low-priced car.

The gradual increase in the popularity of live axles is a conspicuous feature of the last year or two, together with that modification in which it is relieved of the duty of carrying the weight; but it may be recalled that one of the earliest cars had a live axle, while the latter modification was a feature of the De Dion heavy vehicles of ten or more years back. Much still remains to be done in the question of transmission efficiency. Six years ago this was put at from 50 to 60 per cent. in the most favourable instances, and there is not much to show that it has been very materially increased; its progress, indeed, has probably been absolutely retarded by engine improvement, and it still seems rather an unexplored field as far as manufacturers are concerned. The same cause, no doubt, has left makers somewhat blind, except where considerations like the Tourist Trophy intervene, to the inherent ugliness of superfluous metal, and there are few cars indeed off which some of this could not be advantageously chipped. It is, as far as we can see, in details of these kinds that the next few years' progress will consist, as it is chiefly by the gradual accretion of such that the fast and reliable car of to-day has developed from its progenitor of 1896.

and Wildgoose. The first valuable step, however, took place in France, when in 1770 Cugnot actually carried two people in a three-wheeled carriage propelled by steam at the rate of two miles an hour. In 1784 Murdock's model of a tractor was run upon some of the Cornish roads, the power being obtained for a high pressure non-condensing steam engine. This model was in the possession of Sir Richard Tangye, whose death took place a few days ago. Several inventors were at work during the last years of the eighteenth century—Symington and Sadler being most conspicuous—but to Richard Trevithick must be assigned the place of honour for having constructed the first mechanically-propelled road carriage in England and attaining a speed of ten miles an hour. Various ideas for securing the mechanical carriage were tried during the next few years, including the provision of iron pivoted legs resembling the act of walking. Burstall and Hill brought out a steam carriage which weighed eight tons; but the next great advance was in 1823, when W. H. James employed a tubular boiler for the first time. The same inventor worked later with Sir Goldsworthy Gurney, and they succeeded in bringing out a vehicle which attained a speed of fifteen miles an hour when carrying fifteen passengers. In 1828 Nasmyth

constructed a steam carriage, but his efforts were eclipsed by Gurney, who journeyed from London to Bath on his vehicle, and established a public service of steam coaches between Gloucester and Cheltenham. Until Gurney's time, efforts had been mainly directed towards the provision of passenger vehicles; he, however, experimented on lines that were somewhat anticipatory of modern developments, attempting to bring out a vehicle to weigh about five cwt., and to only carry two or three people.

Dr. Church's improvements in steam carriages were the next most conspicuous success, and in 1832 a company was formed at Birmingham to place his carriages upon the road. He designed a double-decked steam omnibus to carry fifty passengers, and had considerable ideas with regard to the mechanical vehicle on common roads. But Hancock was the most distinguished inventor of the period, and Sir Frederick Bramwell eulogised his vehicles, which were in public service about London in 1833-34, as being the quietest and most reliable that had been put upon the road up to that period. About the same time Maceroni and Squire built a steam carriage of a very compact type. It had a multitubular boiler with a fan draught. The boiler was located behind the carriage, a horizontal two-cylinder engine being below the body of the vehicle.

Right throughout the development of the steam carriage, from the experimental trips of Trevithick to the days when steam omnibuses ran in London and Scotland in 1834, strong, interested and prejudiced opposition had to be encountered. Ignorance and interest combined to thwart the extension of the new power by circulating rumours of accidents, by exaggerating the violence of explosions and by piling stones along the carriage way. Those methods having failed, recourse was had to legislative interference, and about this period commenced a series of harassing conflicts that ultimately resulted in the impossibility of continued experiments with any chance of commercial success. Early in 1836 "A Bill to repeal such portions of all Acts as impose prohibitory tolls on steam carriages, and to substitute other tolls on an equitable footing with horse carriages," was before the House of Commons. Ostensibly this was a measure calculated

£20." Having passed through the Commons, the Bill was, on reaching the House of Lords, referred to a Select Committee. Several notable men gave evidence, including Mr. Gurney, who had not built an engine since 1831, and who gave it as his opinion that the extreme size of the boiler should, for public safety, not exceed eight or nine inches diameter. He had retired from the construction of steam carriages because excessive tolls prevented him showing capitalists the prospect of a good return. But since the Bill had passed the Commons he had granted several licences for the construction of his carriage.

A steam 'bus built by Hancock in 1834, and which ran between Paddington and the City.

Mr. Walter Hancock, who mentioned that he had lost from £10,000 to £12,000 in experiments, was asked a question as to the size of the largest boiler which could with safety be used on the public highway. Provided that the materials were well selected and of proper thickness, he said he should have confidence in employing a cylinder of 20 in. diameter. George Stephenson was very emphatic in his declaration that steam carriages would never do on ordinary roads, and also in the opinion that there was more danger in Gurney's boilers than in those of rivals. In the end the Lords' Committee declined to sanction the measure at all. They could not come to an unanimous conclusion on the size of the boiler, and gravely called attention to the fact that it might be difficult to find experienced conductors of the carriages. Attention was also called to the sparks that were emitted, and although it did not appear "that the danger is very imminent," it was deemed worthy of mention in a report which concluded that "any encouragement on the part of the Legislature would only give rise to wild speculations, ruinous to those engaging in them," and, of course, dangerous to the public. Following that was an Act of Parliament passed in 1836, the effect of which was to discourage further experiments.

Burrell's Steam Road Engine 1868-69.

to improve the prospects of the industry, and it got to an advanced stage in the Lower House before its real purport was discovered. But that it was not intended to encourage experiment was clear from a clause which read as follows:—"That it shall not be lawful to use any vessel or vessels for raising or generating steam, to propel any carriage along a public street or road, any part of the transverse section of which shall exceed ten inches in diameter in any direction, if circular or cylindrical, and if such vessel or vessels shall be made of any other figure than cylindrical, then no part of the transverse section or sides shall exceed eight inches in any direction under a penalty for every breach of such regulation not exceeding £100, or less than

## FROM 1837 TO THE EIGHTIES.

IN the long interval following the disappearance of Hancock and Gurney's coaches from the road and the very recent revivals in this country, a few inventors retained an interest in the subject, and Mr. T. Rickett, of the Castle Foundry, Stafford, in 1858 made a road steamer for the Marquis of Stafford, which weighed 1½ tons and had accommodation for three passengers. The steam was supplied to a horizontal engine, the crank shaft of which had a pitch chain pinion giving motion to the driving wheel. In a heavier vehicle made for the Earl of Caithness, who took a great interest in road locomotion by steam, gearing was successfully employed. A large road vehicle weighing six tons was made by Messrs. Carrett and Marshall, of Leeds, in 1861. Designated the "Fly-by-night," it obtained much notice. It had a capacity for seven or eight passengers in addition to the stoker, and was built for Sir Titus Salt, afterwards becoming the property of Mr. Frederick Hodges, who, with Mr. Des Vignes, ran it through Kent, being several times summoned for the offence. The machine weighed nearly seven tons, and had two cylinders, 6 in. by 8 in.

In 1862 Mr. Richard Tangye, of Birmingham, designed a carriage of a very simple type, which attained a speed of twenty

miles an hour without difficulty, and at the Great Exhibition in London that year Messrs. Aveling and Porter exhibited a self-moving steam carriage. In the following year Mr. A. F. Yarrow was successful in constructing a self-propelled carriage with seats for from ten to twelve people.

In 1866-7 Mr. H. P. Holt brought out a road steamer at

Among later inventors Mr. W. R. Thomson is prominent, for it was he who invented pneumatic tyres, taking out his patent in 1845. These indiarubber tyres he fitted to his steam omnibus—designated by the inventor as a "road steamer"—which had a capacity for sixty passengers, but the experiment was not a success. More successful was this inventor with his road

The Squire-Maceroni Steam Carriage built in 1833. The vehicle plied for some time between London and Edgware.

Gurney's Steam Carriage on the way to Bath in 1829.

Leeds of particular interest as not only embracing some good points of earlier practice but incorporating some very ingenious ideas of his own. A fire-engine boiler with Field tubes giving 50 ft. of heating surface was employed. Two small double-cylinder engines drove the two driving wheels, a pitch chain connecting the crank shafts and driving wheels, as was done in the road steamers of Rickett.

steamers supplied to the Indian Government in 1871. They were of 14-h.p., and were constructed at the Ipswich works of Messrs. Ransome, Sims, and Jefferies. Mr. Thomson was careful to protect the rubber tyres with linked steel shoes. In our great Dependency the engines maintained a speed of about ten miles an hour when hauling four-wheeled omnibuses with 65 passengers.

## THE DAY OF EMANCIPATION.

THE true and actually complete history of the celebration of Emancipation Day will probably never be written; all contemporary records are incomplete, many are incorrect, whilst others are so misleading that no dependence can be placed on them. The "official" control was by no means as thorough as that governing automobile functions at the present time, and it is to be feared that other interests of the "controlling powers" contributed in some degree to the confusion and diversity existing in all published records. That the fact should be so is undoubtedly regrettable; but, after all, the actual events of November 14th, 1896, are but of very minor importance compared with those which culminated in the celebration itself.

Although but ten short years have passed, yet those connected with the automobile industry in Great Britain at the present day are in most cases, we fear, too prone to forget, and in many instances to belittle, the strenuous endeavours and unremitting labours of that band of pioneers who secured the repeal of the "Red Flag Act," and the passing of that measure under which only has it been possible for the industry to have its being, and the utility and pleasure of automobilism to grow with the industry to its present immensity.

means whereby automobilists might pay homage to those who deserve so much at their hands.

Of the actual celebrations that marked "Emancipation Day," it may be said that the historic run to Brighton was but the public culmination of weeks of preparation. For these were the days when a week's tuning up was the necessary forerunner to a day's run, even if such became possible at the end of that period. Even then, when one left home, when or by what means the return would be made was extremely problematical. The days of tiller steering, tube ignition, solid tyres, exposed water circulation, and no radiators; the days when the vagaries of carburettors were perhaps more varied than they are to-day; when tube-ignition was complicated by distance pieces and refractory wicks; when pressure feed was complicated by leaking control cocks, and when a delightful ignorance as to causes and their effects enabled the participants to indulge in frequent and entirely unnecessary examination of the internal economy of their motor and its gear. Who, nowadays, other than those participating in the early work, will appreciate the anxious care with which the owners of the few vehicles in England overhauled and again overhauled their charges, and with what anxiety midnight of November 13th, 1896, was awaited. For, of course, no one would wait until daylight to celebrate the freedom from the trammels of the red flag and the attentions of

The "Emancipation Day" Run to Brighton.—The Cars arriving at the Metropole.

It has been said of some of these pioneers that the welfare of a new industry was to them of less importance than the financial schemes in which they had embarked, but similar things may be said in respect of some of the participants in all pioneering. It has been alleged, too, that self-advertisement had a greater influence with many than the creation of a new industry and the bringing into being of a new pastime as well as a new means of locomotion. It cannot be maintained, however, that the age of self-advertisement is yet passed, nor that automobilism is free from its influence, and just as there are now workers for the amelioration of the lot of the automobilist and the freedom from the trammels of police-traps and speed-limits whose labours are entirely disinterested, so ten years ago the embryo of the trade found friends equally hard-working and equally disinterested. But whilst to-day these workers are fighting against the prejudices of the public with the aid of powerful organizations, a backing of tens of thousands of users of automobiles, and the support of the millions of capital embarked in the trade, and that of the hundreds of thousands of those employed in the industry, those pioneers of ten years ago fought single-handed against equally powerful prejudices, and, moreover, conquered. Surely the labours of such as these should be more publicly appreciated, and it should not be a difficult task for the Automobile Club to find

the busy police. But of the police themselves much can be said in respect of "the blind eye"; for did they not for some days before the 14th obligingly turn their eyes away—and close their ears—when a motor vehicle approached them? Whilst the Act awaited the Royal Assent did not a few automobilist pioneers owe them a debt of gratitude in permitting them to "tune up" their cars for the all-important day? Nevertheless, the knowledge of the independence from the "blind eye" made every owner, and not a few of his friends, impatiently await the striking of the midnight hour, and, notwithstanding rain, grease, and general unsuitability of the elements, determine a general exodus into the darkness. It is said, and probably with truth, that more than one unlucky owner afterwards regretted his precipitancy, and had perforce to spend the remaining hours of the early morning in putting his vehicle in order for the parade or run later in the day. For, in addition to the run from London to Brighton by the more adventurous spirits, many owners determined to parade at the meeting place, and to take part in a short stage of the journey to Brighton.

It was usual in the early days of automobilism that functions connected therewith should commence with a breakfast or luncheon and terminate with a dinner. The celebration of Emancipation Day was no exception, the Earl of Winchelsea

presiding. In his speech his lordship begged for the indulgence of the public in forming opinions as to the motor vehicles and their drivers; pointing out, in regard to the latter, that the law had allowed but very restricted opportunities for them becoming intimately acquainted with their vehicles, and the management thereof, especially in the enormous crowds that had assembled to witness this celebration of the freeing of road locomotives from the attentions of the gentleman with the red flag. He claimed further indulgences in view of the bad weather and the consequent terrible condition of the roads. According to the "Official List" there were fifty-four vehicles whose drivers pro-

The First Benz Car, 1885.

posed to take part in the actual run to Brighton, whilst those promising to attend the parade numbered perhaps another twenty. "Various causes," however, tended to this number being reduced to thirty-eight, and perhaps the most reliable list of actual starters is as follows:—Two Panhard cars, including the winner of the Paris-Bordeaux race in 1895, and which led the procession with Messrs. Lawson and Meyer as passengers; eleven Daimlers, among the drivers and passengers on the same being the Hon. Evelyn Ellis, Messrs. F. R. Simms, Van Toll, Critchley, and Crowden; five Bollée voiturettes, two of which were driven by the Brothers Bollée; a couple of De Dion bikes, a French steam bicycle, a Beeston motor-bicycle, two Duryea cars, four Roger belt-driven cars sent by the Anglo-French Motor Carriage Co., three Benz cars, an Arnold dog-cart—a vehicle on Benz lines—a Pennington four-seated tricycle, two Bersey and three Britannia electrical vehicles. There were in addition, however, others who actually did start although they did not proceed very far. For instance, we have a vivid recollection of a Wolfmüller motor-bicycle on the Embankment whose rider was evidently more anxious to participate than his acquaintance with the peculiarities of his steed on a greasy road would warrant. There were several others, too, whose knowledge and skill were unequal to the task of controlling and guiding their vehicles.

The organisation, both at the start and at the run-in, was such, however, that too great a dependence must not be placed on the correctness of the list. Altogether twenty-two cars are said to have made the journey, but the "Official List" gives the following as the arrivals at Brighton by 6 o'clock on the evening of the 14th November:—1 and 2, two Bollée voiturettes; 3, a Panhard; 4, Mr. H. J. Lawson's Panhard; 5, another Panhard; 6, Britannia Bath Chair (?); 7, Daimler Phaeton; 8, Pennington tricycle; 9, Bersey electric landau (?); 10, Panhard; 11, one of the Anglo-French Roger cars; 12, a Daimler; 13, Bersey electric hansom (?). This is, however, most certainly incorrect, for amongst the earlier arrivals was the Duryea from the United States. It certainly did arrive in Brighton, although there were not lacking rumours to the effect that it was not the same

vehicle that started from London. The success of the Bollée voiturettes was unassailable, notwithstanding that their drivers had both departed from the arrangements laid down and had run straight through to Brighton without partaking of lunch at Reigate, as was provided in the programme. These two vehicles, however, were driven by the Frenchmen Leon and Amedée Bollée; several others of the earlier arrivals also had the services of expert French drivers, whose knowledge and experience certainly enabled them to make a better show than their less skilled English confrères.

After the run in, the Mayor of Brighton having met some of the participants at Preston Park, the then customary formal dinner took place. Amongst the most distinguished of the guests was the late Herr Gottlieb Daimler. The events of the day undoubtedly caused a vast amount of public interest. At the starting-place the crowds, notwithstanding the inclemency of the weather, were so dense that the movement of the vehicles was rendered extremely difficult, and although the police undoubtedly did their best, yet the numbers present were quite inadequate to properly control the spectators and ensure a clear passage for the vehicles.

Although much can be written regarding the non-reliability of the records concerning this historic run, a great amount of attention was devoted to the details governing the demonstration by those responsible for its organisation. Indeed, the "Route and Itinerary" issued by the Motor Car Club is in many respects a model even at the present day. The following more particularly deserve commendation, viz.:—"Owners and drivers of motor vehicles taking part in the tour should remember that motor-cars are on their trial in England, and that any rashness or carelessness might injure the industry in this country. Should see that their motor-cars appear in thoroughly good clean order, and are never left unattended on the route. Should be fully provided with sufficient lubricating and motor oil. Should see that passengers are provided with proper precautions against bad weather, such as mackintoshes, &c., and with light provisions. Should use the greatest care as to speed and driving, so as not to endanger ordinary traffic. Should treat the police and other authorities with polite consideration."

Rear View of First Benz Car.

The suggestion that "light provisions" be carried was certainly a commendable piece of foresight. Equally so were the arrangements made for the procuring of water, for in those days motor-cars, being without radiators, were endowed with almost unquenchable thirst, and already in an experimental run in the preceding month some difficulty was experienced in procuring water, as was indeed the case for some years subsequently. As a result, no less than thirteen water depots were established on the route to Brighton.

## THE DEVELOPMENT OF THE MODERN MOTOR-CAR.

### THE INITIAL STAGES.

Daimler Motor Bicycle (1885)

ALTHOUGH various odd machines were built up and down the Continent in the seventies and early eighties, it appears to be now generally accepted that the modern revival of the motor-car movement dates from 1885, in which year three horseless vehicles made their appearance. Strangely enough, two of these were the outcome of the labours of a couple of German engineers—the late Herr Gottlieb Daimler, of Deutz, near Cologne, and Herr Carl Benz, of Mannheim. From the illustration we give of the latter's machine,

it will be seen that it was a three-wheel vehicle; it was fitted with a small horizontal motor, firmly secured to the frame in the rear of the seat, a notable feature being the fly-wheel, which rotated in a horizontal plane. The drive was through a flat belt to the

The first Car built (in 1886) by the late Herr Gottlieb Daimler.

countershaft, on which was located the differential gear, thence by side chains. The engine in this early model was water-cooled on the thermo-syphon system, and electric ignition was employed, Herr Benz being a pioneer in this particular. A supply of petrol and water sufficient for a twenty-mile trip was carried in respective tanks. Steering was effected by a lever mounted on a vertical column which communicated with the forked crown of the front wheel. The seat, with accommodation for two, had an excellent supply of upholstery for those days, and the solid rubber tyre was considered most satisfactory. The maximum speed of the vehicle was only nine miles per hour, while it could ascend gradients of 1 in 12. From this machine the development to the once-familiar Benz dogcart which Mr. H. Hewetson introduced into England, and of which over 4,000 were sold, was the work of but a few years.

The late Herr Daimler's first automobile production, which is shown in the initial illustration on this page, was a so-called motor-bicycle; it was, however, a four-wheeler affair, there being, in addition to the two large wheels, two small wheels, one at each side, these being provided in order to keep the machine upright. The frame of the cycle was constructed of wood, the rider sitting on the petrol tank. The engine was of the air-cooled single vertical cylinder type of  $\frac{1}{2}$ -h.p.; it was fitted with tube ignition, and was located in the centre of the frame, practically between the driver's legs. Two speeds were provided, the power of the engine being transmitted by a belt to a countershaft, the latter being geared by pinions to a spur gear attached to the rear wheel. The motor could be cut out from the transmission by means of a jockey pulley, which, acting on the belt, caused it to grip or run slack as desired. Early in 1886 Herr Daimler fitted one of his motors to a wagonette (as shown above). In this, which was really the first Daimler car, the motor was of a larger size, but the same

method of transmission as in the cycle was adopted. Still continuing his experiments, Herr Daimler, at the Paris Exhibition of 1889, exhibited a petrol motor-boat and a quadricycle, in which the famous V-type two-cylinder engine, a friction clutch, and sliding pinion change-speed gear were introduced. The car was entirely gear driven, the engine being under the driver's seat; the front wheels were carried in forks of the cycle type, while the steering was controlled by a long lever. In 1886 Messrs. Perrin, Panhard and Co., a firm of wood-working machinery manufacturers, which has developed into the present Panhard-Levassor concern, acquired the French rights in Daimler's invention, and under the guidance of M. Levassor effected a number of new departures. To this gentleman, who died in 1897, is usually attributed the introduction of the use of a friction clutch and the sliding pinion type of change-speed gear, but this is open to doubt, as the drawings we have in our possession show that both were used on Daimler's motor quadricycle of 1889, whereas the first Panhard-Levassor was not on the road until 1892. At the same time, M. Levassor's car may be said to be the forerunner of the vehicle of to-day, as it was the first with the engine set transversely under a bonnet in the fore part of a spring-supported wooden frame.

Returning to 1885, the third self-propelled vehicle which made its appearance was one of British design and construction, it being the outcome of the ingenuity of Mr. E. Butler, who exhibited it at the Inventions Exhibition held in Kensington in that year. As will be seen from the illustration, it took the form of a tricycle, which was fitted with two small engines driving cranks on the rear driving wheel by means of curiously-shaped connecting rods. Owing, however, to Mr. Butler not being permitted to use his machine on the road, he was discouraged from carrying his invention further.

From the time the Daimler engine was introduced into France considerable attention was centred on the automobile in that country, among the early workers being M. Peugeot, who at first used the Daimler engine; M. Serpollet, whose fancy turned to steam; M. Roger, who copied the Benz design; and the Count De Dion and M. Bouton, who, working together, developed a motor-tricycle and a steam tractor. So rapid was the progress in France that at the end of 1893 the "Petit Journal" of Paris announced its now famous Paris-Rouen race, which took place in July, 1894, and in which forty-seven vehicles started. The first to reach Rouen was the De Dion-Bouton steam tractor (see illustration), which covered the ninety-seven and a half miles at an average speed of twelve miles per hour. Five minutes after the steamer came a Peugeot carriage fitted with a  $3\frac{1}{2}$ -h.p. Daimler-Panhard engine and solid rubber tyres, then a second Peugeot, and later a Panhard car which had wooden wheels and iron tyres.

The Motor-Tricycle shown by Mr. E. Butler at the Inventions Exhibition in 1885.

The first prize was divided between the Panhard and Peugeot; the De Dion steamer secured the second, and a Serpollet steam car the third prize. The great event of the following year, 1895, was the race from Paris to Bordeaux and back, a distance of 750 miles. Sixteen petrol and seven steam vehicles started in the race, and eight petrol and one steam car arrived back in Paris,

One of the first Peugeot Cars.

the first being M. Levassor on a 4-h.p. Panhard, his time being 48 hours 12 min. However, the first prize was given to a Peugeot car, which arrived shortly afterwards, as the Peugeot was carrying four passengers, whereas M. Levassor's car carried only two. This event was notable as being the first occasion of the appearance of pneumatic tyres in connection with long-distance motor travelling. The Paris-Marseilles-Paris race was the feature of the year 1896 in France. The contest was run off in September in five stages, the distance being 1,076 miles. Of the thirty-two vehicles which started twenty-four were propelled by petrol, three by steam, and five were motor-tricycles. M. Bollée, on his voiturette, astounded the world by completing the first stage at an average speed of twenty miles an hour, which was by far the best performance which had been done up

The 1894 Panhard.

to that time. The race was another victory for the Panhard, M. Mayade being the winner on the first four-cylinder vehicle ever built, his average speed working out at 15.6 miles per hour.

Although it was not until November, 1896, that the motor-car became a legal form of conveyance in Great Britain, reports

of the great progress which had been made in self-propelled vehicles on the Continent had, of course, reached this country, and, in fact, specimens of the cars had also been brought over, the first one being a Benz, which Mr. H. Hewetson received from Germany in November, 1894. The first public display was at the Agricultural Show at Tunbridge Wells in October, 1895. It was organised by Sir David Salomons, Bart., who had long been interested in the subject, he having built an electrically-propelled tricycle in 1874-75. The machines exhibited included this gentleman's Peugeot 3½-h.p. *vis-à-vis*, which weighed 13 cwt., and could attain a maximum speed of about fifteen miles per hour on the level; the Hon. Evelyn Ellis's Panhard-Levassor car of the Paris-Bordeaux type, a De Dion-Bouton motor-tricycle, and a De Dion-Bouton steam tractor. The year 1896 was extremely fruitful as regards automobile exhibitions, all of which played a prominent part in "releasing the motor-car from the tyranny of the red flag." In May of that year an exhibition of motor-cars was held at the Imperial Institute, London, and at a special reception to members of the House of Lords and the House of Commons Mr. Evelyn Ellis had the honour of driving the Prince of Wales (now his Majesty the King) on his Panhard car in the galleries and gardens of the Institute. The show was organised by the Motor-Car Club, of which Mr. Harry J. Lawson was the chairman, and among the exhibits was a Bollée voitu-

The Roots and Venable Heavy Oil Car built in 1895. The vehicle was fitted with a 34-h.p. engine.

rette, two Benz cars, the Lutzmann car belonging to Mr. H. Koozens, of Southsea, a Roger car (a French copy of the Benz), several Hildebrandt-Wolfmüller motor-bicycles—which, according to one who rode them, had practically only two speeds, "one was *nil* and the other twenty miles an hour"—two 4-h.p. German Daimlers, and two Peugeot cars with Daimler motors, a motor tandem bicycle built on the Kane-Pennington system, two De Dion motor-tricycles, an electrical vehicle built in accordance with the Bersey patents by the Universal Electrical Carriage Company, and an electrical dogcart by Messrs. Offord and Son. During the same month an exhibition of motor vehicles was opened at the Crystal Palace, at which Sir David Salomons, Mr. T. R. B. Elliott, Mr. John H. Knight, and others demonstrated their cars by running them in the Palace grounds. The first display of automobiles organised by Mr. C. Cordingley was held in conjunction with the Engineering and Laundry Exhibition at the Agricultural Hall, Islington, in August, 1896. Naturally, it was but a small one, but it attracted considerable attention. It was located in the gallery, in which a miniature lake had been constructed in order to permit demonstrations of a motor-boat to be made by the now defunct firm of Messrs. New and Mayne. The automobile exhibits comprised the Hildebrandt-Wolfmüller motor-bicycle, the Bersey electric carriage already referred to, and an electrical vehicle constructed in accordance with the

designs of Messrs. Garrard (now of the Clement Talbot Company), and Blumfield. The latter machine, which was built by Messrs. Taylor, Cooper, and Bednell, of Coventry, was notable if only for the 4-in. pneumatic tyres with which it was fitted, an unusually large size in those days. It was fitted with a  $1\frac{1}{2}$ -h.p. motor and chain drive, the necessary energy being furnished by a battery of twenty-four cells. The Bersey vehicle, which was the forerunner of the electric cabs which made their appearance in the London streets a year or so later, was designed to seat four persons; it had a  $2\frac{1}{2}$ -h.p. motor, and carried thirty-two I.E.S. accumulators. About this time Colonel H. C. L. Holden brought out a motor-propelled bicycle (see illustration) which contained many interesting features, among which were a four-cylinder engine, synchronised ignition, and mechanical lubrication.

### 1897.

The two leading types of cars at this time, as distinct from the motor-cycle, were those built on the Daimler-Panhard system and those on the lines initiated by Benz. The former comprised all the features of modern cars—engine in front, clutch, gear-box, differential shaft and side chains—while the Benz and Benz-type machines had horizontal engines and belt transmission. As regards the engine, one of the great troubles was the efficient cooling of the same, which necessitated the carrying of a large

The De Dion Motor-Tricycle, 1895-1900.

quantity of water and frequent replenishment of the tanks. Inlet valves were of the automatic or suction type, and the ignition on the bulk of the cars was by a method now no longer seen, and of which those who have joined the ranks of motorists within the past few years have little or no conception. We refer to tube ignition, which comprised a small platinum tube, its inner end extending a short distance into the combustion chamber horizontally at a position close to the top of the cylinder. Around and above the outer, closed, end of the tube was a hood extending for a few inches, while directly beneath it was a lamp having a small cup similar to those used on pressure-fed torches, and a wick. Starting the lamp was effected in the same manner as in the case of the modern torch; as soon as it was sufficiently hot to vapourise the petrol spirit used in the burner, the further feed was left to the working of the motor to maintain the platinum at the right temperature. A small amount of methylated spirits poured into the cup referred to supplied the initial source of heat, and under favourable circumstances an ounce or two of fuel was sufficient to get the engine under way.

The disadvantage of such a system will be readily apparent, but that it served the ends of its designer by accomplishing what was intended of it until something better could be devised goes without saying, for all the original Daimlers, as well as the Panhard cars, were equipped with it. Nor is tube ignition such a matter of ancient history as it may appear to the casual

observer, for it was a feature of the Panhard cars as late as 1902, and when the latter firm first took up electrical ignition it was merely as an auxiliary. Faith in the original remained firm to the extent of continuing its installation until electricity proved itself beyond all doubt the superior method. Naturally the greatest inherent defect of this early form of ignition was its

The Holden-Crypto Motor-Bicycle, 1896.

liability for the lamp to blow out, so that the tube failed to fire the charge, rendering a repetition of the starting process necessary. This and the impossibility of altering the time of ignition eventually resulted in it being discarded for electric ignition. The steering was controlled either by a tiller or by a small hand-wheel set horizontally on the top of a vertical pillar, while the wheel base of the cars was but a fraction of that of the modern vehicle.

In France the industry was developing at a rapid rate. In addition to their motor-cycles, Messrs. De Dion-Bouton were devoting much attention to heavy steam vehicles, and at the Poids Lourds, or heavy vehicle competition held in 1897, entered a 40-h.p. steam tractor and a 30-h.p. 18-seated 'bus, which latter

The Pennington Convertible Motor-cycle, 1896.

attained the best average speed—nine miles per hour—in the contest. The other competitors included a Panhard 10-seated 'bus, a  $1\frac{1}{2}$ -ton petrol van built by Messrs. De Dietrich and Co., whose first car was turned out in 1896, a Le Blant steam brake, a Scotte road train, and a Wiedknecht steam 'bus. The latter was afterwards brought to London for demonstration purposes. At

home the early days of the movement were unfortunately marked by a company-promoting boom, mainly engineered by the British Motor Syndicate, who attempted to control the whole British industry by buying up the patent rights in all the principal

ing to commence the manufacture of a car on improved Benz lines, while in London the Britannia Motor Carriage Co. also built a number of electrical vehicles. Other firms interested in the trade were Stirling's Motor Carriages, of Hamilton, who

The Bollee Voiturette introduced into England in 1896.

One of the Duryea Cars which participated in the run to Brighton in 1896. It had a Horizontal Engine and Bevel Gear Drive.

systems. It is recorded that, although a number of concerns were experimenting with automobiles, there were only six firms actually building motor-vehicles in this country at midsummer, 1897, these including the Daimler Co., the Great Horseless Carriage Co., which afterwards became the Motor Manufacturing Co., the Anglo-French Motor Carriage Co., which had established works in Birmingham for the construction of cars on the lines

did much to popularise the motor-car in Scotland, Mr. H. Hewetson (Benz cars), the Arnold Motor Carriage Co., Messrs. Petter, Hill and Boll, of Yeovil, who built a car with a paraffin engine, and Messrs. Roots and Venables. The last-named firm confined their attentions to the utilisation of petroleum as opposed to the spirit. Their first car, of which we give an illustration, was built in 1895, and ran on the road early in 1896.

The Delahaye Car of 1896.

of the Roger—the French Benz—the New Beeston Cycle Co., the Coventry Motor Co., and Messrs. J. I. Thornycroft and Co., whose speciality at that time was steam wagons. At Manchester, Messrs. Marshall and Co., now Belsize Motors, Ltd., were arrang-

The machine was fitted with a vertical oil motor on the Roots principle of vaporisation and feeding of oil, and was of 2½ b.h.p. The method of steering was the cycle head and fork, with the addition of a heavy coil spring fitted inside the head, which per-

mitted the fork spindle to slide vertically within the head. The motor had a friction clutch attached to its crank shaft, so adjusted that if more resistance than the equivalent of  $2\frac{3}{4}$  h.p. were placed upon the clutch, it would automatically slip. In practice, this slip only took place when starting, when changing speed, and when on steep hills. A chain from the friction clutch drove the outer casing of a box of gears providing two speeds. It was first tried with a speed of thirteen miles an hour, but the side slip or skidding of the single front steering wheel made the steering, when going at this speed on a greasy road, very erratic and even

of engine, which had two vertical cylinders; a 10-h.p. delivery van, in which the transmission from the engine to the counter-shaft was by belt; a couple of motor-tricycles, and a  $1\frac{3}{4}$  h.p. Bollée voiturette. The Daimler Motor Company, Limited, which was formed in February, 1896, had on view two 4-h.p. cars, geared up to a top speed of 16 miles per hour, while the London Motor Van and Wagon Company, Limited, which has long disappeared, showed a trio of useful vans built on the Daimler 4-h.p. chassis. It may be of interest to here note that the price of the Daimler 4-h.p. chassis was £294 net, complete cars being

The De Dion Steam Tractor built in 1894.

The first Wolseley Car. Built in 1895-96, it was fitted with a 2-h.p. double-cylinder engine, the cylinders being on one side of the single rear wheel, and the flywheel on the other. The drive was by a combination of belts and chains.

dangerous. The reduction to eleven miles an hour, together with the addition of weight over the steering wheel, however, surmounted this difficulty.

The second of the Agricultural Hall Exhibitions took place from August 23 to Sept. 24, 1897, and was marked by a noteworthy increase in the number of exhibitors. The Great Horseless Carriage Company, Limited, had one of the largest stands, their exhibit comprising a couple of 4-h.p. pleasure cars, built on Panhard lines, and fitted with the latest Daimler-Phoenix type

listed from £316 upwards. The London Electric Cab Company displayed several of their Bersey-Brougham electric cabs, and the Hon. C. S. Rolls a four-seated Peugeot car, with the engine at the back. In connection with this vehicle it may be mentioned that the Peugeot Company is one of the oldest automobile builders in France; as long ago as 1888 it built two steam vehicles—tricycles—fitted with the Serpollet generator. In the winter of 1889-1890 a couple of experimental two-seated cars, with Daimler  $1\frac{1}{2}$  h.p. motors, were turned out, while a few months

later the first four-seated Peugeot—a *vis-à-vis*, with a Daimler 2½-h.p. engine—was produced. This was remodelled in 1891, and in September of that year a vehicle was successfully driven from Valentigney to Brest and back, the marvellous performance bringing forward an immediate purchaser for the machine from Alsace. In fact, quite a demand sprang up for the little machine, of which twenty-one were built in 1891, since which time the Peugeot Company have turned out many thousands of cars.

The Benz Car of 1896.

Returning to 1897, it was in this year that the Humber Company, of Beeston and Coventry, began to devote attention to automobiles, and brought out a three-seated machine somewhat on the lines of the Bollée voiturette. It was fitted with a 2½-h.p. single-cylinder horizontal engine, having tube ignition. The Humber firm also introduced a motor tandem bicycle, fitted with a couple of 1 1-6th-h.p. De Dion type engines, to which electric ignition was applied. So little was the latter in favour, however, that the announcement was made that "future machines will have tube ignition." What was probably the first lady's motor-bicycle was built by the Humber Company about this time. The Beeston Cycle Company, Limited, were building large numbers of 1½-h.p. motor-tricycles, these being furnished with either tube or electric ignition. A somewhat novel machine was towards the end of the year brought over from Brussels by a M. De la Croix; it took the form of a "sociable quad," in which the two passengers sat side by side, and was driven by two 1-h.p. air-cooled engines, geared direct to the back axle.

The steam wagon was also in course of development, its construction, in addition to Messrs. Thornycroft and Co., being taken up by Messrs. Coulthard and Co., of Preston, and the Lancashire Steam Motor Company, Leyland. The last-named concern had begun operations as a private company in 1896, with the object of making steam-propelled lawn mowers and of experimenting with road vehicles of the heavy pattern. The first machine produced was a steam van, built with the idea of competing in some trials which took place at the Crystal Palace in 1896. Unfortunately, this van did not comply with the conditions imposed by the judges in the matter of tare weight. The vehicle was designed to weigh less than this when complete, but, to the disappointment of its builders, the stipulated margin was exceeded by 6 cwt., and it was consequently not entered for the trials. The disappointment was, however, compensated for in 1897, in which year the Royal Agricultural Society of England held some trials at Crewe, and although several entries were received, only one vehicle put in an appearance, and that was the van alluded to above, which was awarded the Society's silver medal, and which was the forerunner of the Leyland steam wagon now so largely used for municipal purposes, by brewers, and other concerns for the transport of heavy loads. Messrs. Toward and Co., of Newcastle-on-Tyne, also turned out, in 1897, a steam van fitted with a water-tube boiler and horizontal engine, this being followed by a tractor.

Considerable money was also spent in unfruitful experimental work in connection with electrical motor-buses. The Electric Motive Power Company built a 26-seated double-decker, as did Mr. Radcliffe Ward, for the London Electric Omnibus Company, while the Wolverhampton Electric Street Car Syndicate, under the direction of Messrs. T. H. and T. Parker, had established works for the construction of electrical vehicles designed for public service. A notable event of 1897 was the inauguration of the service of electrical cabs, about thirty of which were put on the streets by the London Electrical Cab Company. Elaborate arrangements were made at the headquarters of the concern in Lambeth for the rapid substitution of the discharged batteries by fully-charged cells, and although the venture attracted considerable attention abroad—one of the cabs being sent in October, 1897, to Paris, where a similar service was started—the company met with many difficulties, and eventually the service was suspended.

### 1898.

Although those whom we may term the old-established makers of petrol motor-vehicles made very little change in their different systems of motors and transmission gear, a noticeable feature of the year 1898 was the introduction of several improved details in the way of carburettors, water-cooling arrangements, tube and electrical ignition devices, friction clutches, &c., the prompt adoption of which, where they have proved themselves more efficient than the old arrangements, materially assisted in the production of more reliable vehicles. The various public trials of automobile vehicles that took place during the year, including the "Concours" held in Paris for testing hackney carriages, the Paris-Versailles trials of heavy motor-vehicles, the trials of vehicles carrying from two to five tons at Liverpool, conducted by the Self-Propelled Traffic Association, the trials of vehicles carrying loads of one to three tons held by the Royal Agricultural Society at Birmingham, besides the innumerable public tours

Mr. F. F. Wellington on the Britannia Electric Carriage in 1896-97.

organised by different clubs and associations, all served to convince even the most sceptical that automobile locomotion had passed through its first stage of experimentation, and was emerging into a strictly practical stage of definite manufacture. The cars with the engine located in front continued to be the prime favourites, but there were many who held that the practice was wrong, considering not only that the arrangement was unsightly, but that the necessarily high and somewhat heavy frame imposed severe limitations on the designers of carriage bodies.

The Motor Manufacturing Company endeavoured to break away from the standard practice and brought out a new design, in which the engine and gear were located within the carriage body, which, however, proved unsuccessful in securing the public fancy.

At the Paris Show, which was held in June, and at which there were no less than 300 exhibitors—an indication of the strides the industry was making—among the familiar names were Panhard, who introduced a 12-h.p. car; Peugeot, who exhibited a brougham, a forerunner of the modern petrol town carriage; Mors, who showed an 8-h.p. car with the engine in front in place of at the rear, as in his former vehicles; Delahaye, De Dion-Bouton, Bollée, and De Dietrich, the latter concern building cars

brake, which, when the clutch was released, quickly brought the male portion to rest, and so facilitated speed changing. Other petrol cars on view included the Mors dogcart, with its four-cylinder V-type engine, the Georges Richard, Cambier, Le Blon, and Bergmann, all more or less copies of the Benz, the De Dion and Barrière motor-tricycles, the Bollée voiturette, and a somewhat similar machine built by the Compagnie Française d'Automobiles. At Keighley, Mr. F. Lister built a somewhat novel car in which the drive was by frictional contact between small rollers on the end of a cross shaft and the tyres of the rear road wheels. The engine was of the double-cylinder horizontal type, and was so arranged that it could be started from the driver's seat.

M. Serpollet on one of the early Serpollet Steam Cars. Reproduced from a photo taken in 1896.

to the design of Amedée Bollée, in which a novel combination system of transmission by belt and gears was employed. M. Georges Richard, the Hurtu Co., and Messrs. Rochet-Schneider were also present with improved forms of the Benz, while M. Koch, who was one of the early workers in connection with the utilisation of paraffin as fuel in place of petrol, brought out a novel form of motor, in which one explosion chamber was common to the two horizontal cylinders. The Daimler, Motor Manufacturing, and the London Motor Van and Wagon Companies were again prominent exhibitors at the third Cordingley Show, which was held from August 29 to Sept. 3, 1898. A new departure of the Daimler Company was the fitting of a stop, or

Electrical vehicles, notwithstanding the difficulty experienced in connection with the batteries, were popular, especially for town work, among the firms engaged in their production in France being Krieger, Mildé, and Jeantaud. The latter brought over to the London show a motor-hansom, the body of which was almost identical with the motor-cabs in use to-day, except that the driver was perched up at the rear just as he is in a horse-drawn hansom. The Headland Electrical Company brought out a new car, in which the Headland accumulator was employed, while from America came the Riker electrical carriage, which, by reason of its light construction, attracted considerable notice. The weight of the battery, the uncertainty of its life and dura-

bility, and the limited range of travel on one charge, however, prevented any great advance being made.

While it was admitted that Great Britain was behind France as regards the petrol car, this country quickly took the lead in the production of heavy steam vehicles. Already in 1898 British builders were supplying steam road vehicles for use in

The 1897 Georges Richard Car.

Belgium, in France, in the Soudan, in South Africa, and in a great many provincial centres of Great Britain, as well as in the metropolis. Those of Continental origin were much too heavy, besides too wide and too large to render their use possible under the stringent conditions laid down in the Light Locomotives Act and the Local Government Board's regulations, which caused British ingenuity to be exercised most profitably, with the result that firms in this country were producing, and are still producing, steam vehicles for heavy loads which owe no part of their design, equipment, or method of construction to foreign inventors. Among the new-comers were Messrs. David Martyn and Sons, Limited, of Hebburn-on-Tyne, who built an exceedingly novel design of heavy steam 'bus arranged for thirty outside passengers only, the seats being arranged lengthwise of the vehicle. The engine, boiler, and fuel supply were carried at the rear of the machine, the conductor attending to the stoking and lubricating. The boiler was of the fire-tube type, and the engines of the high-pressure, vertical, inverted pattern. Messrs. Gillett and Company, of Hounslow, also constructed a double-deck steam 'bus to carry twenty-five passengers, for the Motor Omnibus Syndicate, Limited. The boiler, which was located in the fore part of the vehicle, was of the water-tube form, the engines were of the compound, vertical, reversing type, the power of the same being transmitted to an intermediary shaft by chain gear, and thence to each rear road wheel by Renold silent chains. The Clarkson Co., who were then located in South London, constructed two new steam vehicles, one a victoria and the other a landau. The engine was of the multiple-cylinder simple-acting type, with six cylinders all operating on the same crank. The principal reason advanced for employing this novel design of engine was that all dead centres were avoided. There were many other special features in the cars. For instance, the exhaust steam was conveyed through the tubular frame of the vehicle to a tube at the top of the "swan-neck" of the frame, from thence being distributed to the various pipes of the condenser. To further assist condensation, the mud-guards were made hollow, and through these also exhaust steam passed to the tank. At Carlisle, Mr. Theo. Carr, who in 1897 had built an experimental three-

wheel steam car, brought out an improved machine fitted with four wheels.

In the motor-cycle world indications of a coming boom were not wanting, as at least thirty firms connected with the cycle industry were known to be experimenting with them. The principal novelty of the year was the Werner motor-cycle from France, with the early history of which Mr. J. J. Leonard was connected in this country. The motor, which was of  $\frac{3}{4}$ -h.p., was attached forward of the head of the machine, and drove by a belt on to a pulley connected with the front wheel. The machine quickly ran into favour, notwithstanding its nasty tendency to skid on the slightest provocation, the resulting dangers of which were increased by the hot tube ignition at first employed.

As regards public service and motor-bus vehicles, the principal item of interest was the appearance of a German Daimler 14-h.p. single-decker, a forerunner of the many vehicles of the Milnes-Daimler type, of which over 200 are in use in London to-day. In July the London Steam Omnibus Company, Limited, was formed, with the object of running motor-buses in London. Although the word "steam" was included in its title, and the object was to run steam 'buses of the De Dion type, yet the company was "entitled to use the most successful type of motor-bus, namely, the Panhard and Levassor and Daimler." The company had a brief and inglorious career; strangely enough, the net visible result was the intermittent operation of a couple of Daimler motor-buses between Kennington and Oxford Circus for a period of about twelve months.

The year closed with the formation of a combination which, since the victory of the car of its descendant concern in the 1905 Tourist Trophy Race, has sprung into the front rank of British motor-car builders. We refer to the Mo-Car Syndicate, Limited, the forerunner of the new Arrol-Johnston Car Company, Limited, in the initiation of which Sir Wm. Arrol and Messrs. A. and P. Coats, of the big Paisley concern, were connected. Another new Scotch concern was the Madelvic Motor

The Marshall Car of 1897-1900.

Carriage Company, which established works at Granton to build electrical vehicles, but which, unlike its Paisley rival, had but a short career.

No chronicle of 1898 would be complete without a reference

to Mr. E. J. Pennington, whose projected cars were much heard of in the early days of the movement, and from whom challenge after challenge emanated. In 1897 he kept himself in the background, but returning into prominence in 1898, motoring circles were soon all set agog with the promise of startling new vehicles. A very entertaining book could be written of Mr. Pennington's brief but lively career in the British automobile industry. His personality was such that not only was he able to inspire confidence in the public, from whom orders for his marvellous cars flowed in at an astonishing rate, but he induced quite a number of old-established firms to lay down plant to manufacture the same. In fact, in July, 1899, he announced that no less than eleven firms were engaged in their construction. Whether all or even the majority of these turned out any cars, it is difficult to say, but there is no doubt

existence, so far as this country was concerned, almost as suddenly but with less noise than they sprang into prominence.

1899.

#### THE VOITURETTE CAR.

Eighteen hundred and ninety-nine proved a year of many developments, one of the most important of which was the production of the Renault and De Dion voiturettes, which have had such an important bearing on modern motor-car construction. Of the former, quite an interesting volume could be written. Designed by M. Louis Renault, the son of a cloth manufacturer at Roubaix, it not only set a fashion to the world, but has given rise to the huge establishment of Messrs. Renault Frères at Billancourt, near Paris, from whence are turned out large numbers of vehicles which have long enjoyed an unrivalled reputation

Mrs. Pennington on the Pennington Car of 1898.

that at the 1899 Show great interest was centred on the Universal four-seated single-cylinder car, exhibited by Messrs. Pennington and Baines, and on the Pennington-Stirling double-cylinder cars displayed by Messrs. Stirling; the latter were on exceedingly novel lines, the engine being so located under the floor-board that the fly-wheel rotated in a horizontal plane, the power being transmitted by a light chain and belt to the front axle. Two speeds were provided, while the steering was effected by the rear wheels. A feature of the Pennington engine was that no carburettor was employed, the oil being fed directly into the explosion chamber, having previously been heated by passing through the exhaust silencer. Although reports were issued from time to time of the great progress the vehicles were making, the cars and their designer dropped out of

from the point of view of quiet running. We give an illustration of the 1900 model, but the original machine was even a smaller vehicle, being fitted with a 2½-h.p. De Dion air-cooled engine, located in the fore part of a tubular frame. The gear-box, which was adapted to give three speeds and a reverse, is claimed to have been the first in which a direct drive from the engine to the back axle was obtained—a highly-prized feature in modern cars, and being the subject of a patent, has already given rise to litigation. Another noteworthy point in the Renault voiturette was the transmission of the power by a universally-jointed shaft and bevel gear to a rear live axle, a forerunner of the shaft-driven car which is competing so keenly with the chain-driven type. The first De Dion vehicle (see illustration), which was made to accommodate two or three passengers, was provided with a 3-h.p.

motor, two new departures in connection with the latter being water cooling, and the substitution of a spray type of carburettor in place of the surface type hitherto employed by this firm. The engine was located at the rear, and drove the back wheels through a special form of change-speed gear, in which the pinions were always in mesh, and which gave two speeds,  $7\frac{1}{2}$  and 19 miles per hour. The frame of the car was of steel tubing,

The early Panhard Car, formerly owned and driven by the Hon. C. S. Rolls, who is seen at the helm. This car is of special interest as having been the winner of the Paris-Marseilles Race in 1896, and was the first motor vehicle to be fitted with a vertical four-cylinder engine. . . .

while the road wheels were of the cycle type and of equal size. For the rear axle Messrs. De Dion-Bouton followed the system they had adopted in their heavy steam vehicles, the axle being built up of two parts, connected together by four cardan or universal joints. To meet the demand for a light two-seated car, the Panhard-Levassor Company also brought out a 3-h.p. vehicle, the engine of which was neither horizontal nor vertical, but was set at a slight angle. The construction of the vehicle was taken up by M. A. Clement, of the Clement-Bayard and Clement-Talbot concerns, and under various names a very large number were sold in England. The Peugeot Company, who were then building cars up to 18-h.p., also entered into competition for the trade in voiturettes by bringing out a 3-h.p. vehicle, fitted with a double-cylinder horizontal engine. Early in 1899, Messrs. Darracq, in addition to their motor-cycles, constructed a machine in accordance with the designs of M. Léon Bollée; it was a more powerful edition of the Bollée voiturette, and partook more of the appearance of a car, four road wheels being employed. The horizontal engine was retained, and the flywheel was outside the frame. The machine was belt-driven, and the ignition was by incandescent tube. Messrs. Delahaye were turning out an 8-h.p. machine, fitted with double-cylinder horizontal engine and belt drive, and a novel feature of which was that the speed of the engine was controlled by a pedal, which varied the quality of the explosive mixture. Belgium was also early in the field with light cars, from that country coming the Deschamps, the F.N. and Pieper two-seated cars. The first named was of  $4\frac{1}{2}$ -h.p., while the two latter were fitted with 3-h.p. air-cooled engines and belt drive; another Belgian belt-driven machine, with  $3\frac{1}{2}$ -h.p. air-cooled motor, was the Vivinus, and which, under the name New Orleans, enjoyed a large measure of popularity.

So rapidly had the industry and movement grown, that the annual Cordingley Show at the Agricultural Hall, Islington, which opened on July 3rd, 1899, and which immediately followed that held by the A.C.G.B.I. in the Old Deer Park, Richmond, was entirely confined to motor-cars and automobile accessories. The exhibits themselves were ranged under the galleries on the

ground floor, the central portion of the latter being converted into a large covered arena, 320 feet long by 100 feet wide, in which trial runs were given all day long. This arena proved a great success, and within its confines thousands of present-day motorists made their initial trip on an automobile. The struggle between petrol, steam, and electricity was very keen, each section being represented by a large number of exhibitors. Prominent among those who displayed the petrol cars were the Daimler Motor Company, Limited, who had on view a number of their standard  $5\frac{1}{2}$ -h.p. two-cylinder cars; which for the first time were fitted with radiators, by means of which the amount of water which had to be carried was reduced to four gallons, "sufficient for a day's run"! Considerable attention was also centred on the new Critchley two-seated car, in which the 4-h.p. engine was fitted with its crank shaft parallel with the axles. In this vehicle two speeds were obtained by a belt-drive from the engine to an intermediary shaft, which in turn was connected with the rear axle—of the live type—by a single chain. The vehicle was fitted with horizontal hand-wheel steering. Another exhibit of note was a four-cylinder engine rated at  $11\frac{1}{2}$ -h.p.; this consisted of two pairs of the standard Daimler motor, and was provided with tube ignition, and was only being fitted into pleasure cars in fulfilment of special orders. Towards the end of the year the Daimler Company brought out a new 6-h.p. model known as the Parisian Daimler, the chief departure in which was the adoption of inclined wheel steering, a feature which was already to be found on a number of French cars, and the location of the change-speed lever at the side of the driver instead of on the dashboard. The exhibit of the Motor Manufacturing Company was notable for its extensive range, including, as it did,  $1\frac{1}{2}$ -h.p. English-built De Dion-type motors, arranged for either tube or electric ignition, motor-bicycles and quadricycles fitted with the same, a Bollée voiturette, a number of the standard  $5\frac{1}{2}$ -h.p. M.M.C. cars, and fitted with various types of bodies, including dog-carts, char-à-bancs, and vans, the Sandringham phaeton, which had a 6-h.p. horizontal engine, and a Princess two-seated car; the latter was fitted with a  $4\frac{1}{2}$ -h.p. double-cylinder motor, and had three forward speeds and two reverse motions, the final drive being by a single chain; and the Balmoral 11-h.p. char-à-

One of the Electric Cabs in service in Paris in 1898.

banc, in which a horizontal engine was also employed. Messrs. Friswell displayed a number of the Mors dog-carts, De Dion tri-cycles and Benz cars, and a neat little machine known as the Elan. This was a two-seated car of French construction; it was fitted with a 3-h.p. two-cylinder air-cooled engine, a fan, as

in modern cars, being provided to increase the draught. The change-speed gear was of the sliding type, giving four speeds forward and a reverse.

The products of the Cannstatt Daimler firm—as the makers of the Mercedes vehicles were known in those days—were shown by the Motor Carriage Supply Company, and included a 7½-h.p.

The De Dion Voiturette of 1899.

lorry, to carry one and a-half to two tons, a 5½-h.p. wagonette, and a 5½-h.p. sporting car. The latter was a notable machine in several respects; in the first place, it marks not only the introduction of the honeycomb radiator, but also of the air-inducing fan, while as regards the change-speed gear, the four sliding pinions were arranged in two pairs, each being controlled by a single lever. Another novelty at this stand was the Simms Motor Wheel, a weird-looking 1½-h.p. three-wheeler, arranged for two riders, one behind the other. A new-comer into the British motor world at this show was the Star Engineering Company. Taking up the construction of motor-cars towards the end of 1898, their first production was an improved form of Benz. The machine, of which an illustration will be found in the present issue, was arranged to carry three persons; it was fitted with a 3½-h.p. horizontal engine, single cylinder, with electric ignition. Two speeds were provided, the transmission being by belts working on fast and loose pulleys. Much interest was centred in the vehicle, especially when in June of the following year one of them succeeded in climbing the famous Birdlip Hill in Gloucestershire. Mr. F. C. Blake, who was early in the field as a specialist in coils and other electric ignition fittings, turned his attention to motor-car construction and built a three-seated vehicle, somewhat on Benz lines, the engine being a double-cylinder horizontal one of 3-h.p. The Automobile Association could always be expected to bring forward a number of novelties, and this year was no exception to the rule. Their exhibit comprised a Barrière motor-tricycle, which proved a no mean rival to the De Dion, several Mors four-seated dog-carts, and a 4-h.p. Petit Duc by the same maker. The car which drew most notice was probably the Orient Express. This was of German origin, brought out to compete with the Benz, from which it differed by its more robust construction, the employment of jockey pulleys to tighten or slacken the belts instead of employing fast and loose pulleys, and the fitting of magneto ignition. The first cars were of 4-h.p., the engine being of the single-cylinder horizontal type. The Gobron-Brillié or "Silent," as it was then known, attracted considerable attention on account of the novel design of the engine, the type being retained even in the modern cars of this make. The vehicle was fitted with a 6-h.p. vertical engine, the two cylinders of which were provided with four pistons, the explosion taking place between them.

For some time considerable attention had been given by Continental designers in the production of *avant trains*, or motor fore carriages, in which the whole of the engine and driving gear was attached to a pair of road wheels in such a way that the

latter could be substituted for the front pair of wheels of ordinary horse-drawn vehicles. Of this type of vehicle the Kuhlstein-Vollmer, shown by the Automobile Association, was a notable example. It was constructed in Berlin, and, attached to a cab, attracted considerable notice at the Show, as also did the Pretot *avant train*. The latter machine, which was fitted with a 5-h.p. two-cylinder horizontal engine, was provided with an exceedingly novel gear, which gave three forward speeds and a reverse. Although the idea was an attractive one, it did not give satisfactory results in practice, and eventually both cars disappeared from the horizon of motordom.

Mr. C. T. Crowden, a name which is intimately connected with the early history of the cycle and motor industry, had established works at Leamington, from which both a steam and a petrol car were turned out. The steamer took the form of a brake, the power being generated in a multitubular boiler located in the fore part of the car, which was notable for its long chimney. The petrol machine was fitted with a dog-cart body to seat six persons. The engine was on unusually novel lines; it was of the horizontal double-cylinder type, rated at 10-h.p. Dispensing with the usual water-jacket for cooling purposes, Mr. Crowden so arranged his motor that the two cylinders were entirely enclosed in a large water tank. The transmission was by a combination of belts and chains.

Messrs. Hewetsons were well to the fore with the Benz cars, which were now being fitted with three speeds, the additional one being known as the crypto, or hill-climbing gear. The standard 3½-h.p. machine was supplemented by a 5-h.p. dog-cart and an 8-h.p. ten-seated brake, and a car with wooden wheels in place of the wire type also made its appearance. The Southern Motor Car Company, with which Mr. Riches, of the present-day-firm of Messrs. G. T. Riches and Co., was connected, had on view a Georges Richard two-seated belt-driven car. This was largely a copy of the Benz, the 3½-h.p. horizontal engine having a water-jacket, with

Leon Bollee-Darracq 5-h.p. air-cooled Car (end 1899).

a radiator at the rear of the vehicle. From Manchester Messrs. Marshall and Co. brought the Marshall car, which was of 4-h.p.; it was practically a copy of the French Hurlu, having a 4-h.p. single-cylinder horizontal engine at the rear, and a combination belt and chain drive, as in the Benz. Another novel vehicle was that made by the Higgs Champion Car Syndicate. It was built to carry four

persons, and was fitted with a  $1\frac{1}{2}$ -h.p. De Dion engine! The latter was so arranged that it could be started from the driver's seat. Belt transmission was adopted, this giving a couple of forward speeds. Other firms which turned out belt-driven cars somewhat on the Benz lines about this time were the Endurance Motor Company, Coventry, Messrs. Brown and Buckton, of Halifax, and the Yorkshire Motor-Car Company. Messrs. F. Jackson and Co. introduced a novel three-wheeler for two persons; it was fitted with a  $2\frac{1}{2}$ -h.p. single-cylinder engine with electric ignition, the power from which was transmitted through belts and gear-wheels to the rear axle. One of the novelties of the show was, however, the Victoria Combination, also known as the Eureka, brought over from Paris by Mr. D. Farman. It really consisted of a two-seated two-wheeled trailing car, to the front of which was attached a pair of wheels, on which was mounted a  $1\frac{1}{2}$ -h.p. De Dion air-cooled engine and a two-speed gear. The steering was controlled by a long tiller, on which the engine control levers were mounted. The little machine became exceedingly popular for a time, but lost its attractions as the desire for more power and speed grew. A feature of the Richmond Show was the Decauville 3-h.p. double-

enjoy his ride with others, trailers and fore-carriage attachments rapidly came into vogue. Several new motor-bicycles made their appearance, including the Lamaudiere, but, despite the growing demand, Messrs. De Dion-Bouton looked upon them as dangerous machines, and would only build motor-bicycles to order. Even as now, air-cooling was looked upon merely as a makeshift, and when the Buchet *culasse* was introduced towards the end of the year there was quite a rush in motor-cyclist circles to have the *culasse*, or water-cooled head, fitted to the De Dion and Aster motors. Among the novel exhibits in the motor-cycle section at the Agricultural Hall Show were those of Lawson's Motor Safety Company, whose display included a motor-bicycle in which the  $1\frac{1}{2}$ -h.p. engine was fixed on one side of the rear wheel, and a 2-cwt. carrier tricycle, which had the motor attached to the side of the front wheel. The Phœbus, Darraq-Perfecta and De Dion motor-tricycles and quadricycles, which were greatly in vogue about this time, were shown by Messrs. Noe Boyer and Co., Messrs. Brown Bros., and Messrs. De Dion-Bouton and Co. respectively. The Phœbus machines, as those built by Messrs. Boyer and Co. were known, were fitted with Aster engines, a type which has since

The British Daimler Car of 1898.

cylinder cars (see illustration), with which the expert drivers—one of whom was Thery, the winner of the 1904 and 1905 Gordon-Bennett races—did many astonishing things in the way of steering between pillars and posts. The motors were located at the back, and the transmission was through bevel gear, which was entirely unenclosed. A later model brought out by the Decauville Company in France in the same year had a 4-h.p. water-cooled motor located in the front part of the frame. One of the first petrol motor-buses to be seen in this country was also on view at the 1899 Show, it being exhibited by Messrs. Bayley's, Limited. As can be observed from the photograph of the Arena reproduced on another page, the bus did not outwardly differ very much from the vehicle of the present day. The chassis was of the German Daimler Company's construction, the engine being of 12-h.p.

The expected boom in motor-cycles duly set in by the end of the year, and it was reported that over 5,000 machines were in use in France alone, and that Messrs. De Dion-Bouton had orders in hand for no less than 14,000 of their small high-speed engines. The horse-power of the motor-tricycles had increased to  $2\frac{1}{2}$ -h.p., and with the view of enabling the motor-cyclist to

become one of the most largely used. The first engines were, of course, of the air-cooled type, their main difference between the De Dion, which had up to that time held practically a monopoly in the field of high-speed vertical engines, being in the air-cooling fins, which, instead of being cast with the cylinder, consisted of corrugated rings of copper. The Aster carburettor, then universal on motor-cycles, while of the surface type, was of a novel design; it was of large dimensions—resembling a grocer's coffee canister more than anything else. Among those catering for the demand for motor-cycles were Messrs. Dennis Bros., of Guildford, who also in this year built a small "Speed King" two-seated 3-h.p. car, the forerunner of the 1,200 odd pleasure and commercial vehicles they have since been turned out; and Messrs. Allard and Co., of Coventry, now the Rex Motor Manufacturing Company, were also among the early British firms to manufacture motor-cycles, and towards the end of the year brought out a strange-looking  $2\frac{1}{2}$ -h.p. car. The Rover Cycle Company built a motor bath chair fitted with a  $1\frac{1}{2}$ -h.p. De Dion engine, which they exhibited at the Richmond Show; while towards the end of the year the Century Engineering and Motor Company, whose works were then at

Altrincham, Cheshire, brought out a tandem motor-tricycle, which may be regarded as one of the earliest tri-cars, as such machines are now known, and which, unfortunately, was before its time.

A good deal of attention was being devoted to the question of cars fitted with engines adapted to use paraffin in place of fuel. In addition to Messrs. Roots and Venables, at this time

■ The Riker Electric Carriage, 1898.

Mr. Edward McLaohlan built a little two-seated three-wheel machine, fitted with a 2½-h.p. single-cylinder horizontal engine using paraffin as fuel. Two speeds were obtained by means of belts, either of which could be tightened so as to transmit the power by means of jockey pulleys. From France, the Automobile Association brought over the Koch heavy oil car, which has already been referred to.

The display of electrical vehicles included an electrical victoria by Mr. Carl Opperman. This was fitted with a 7-h.p. motor driving through gearing on to a differential shaft, and thence by side chains to the rear wheels. The steering wheels were mounted, not on the usual pivots, but on an ordinary

Sir David Salomons on his Ferpollet Steam Car, 1898.

axle, the steering being effected through a special turntable and double reduction gear, which enabled the car to be turned in a small space. Mr. E. H. Clift also built a four-seated electric victoria, in which the transmission was on similar lines. The Joel Electric Carriage, Motor, and Battery Syndicate exhibited a neat brougham in which a couple of 2-h.p. electric motors were

employed, a battery of Rosenthal accumulators, stated to have a capacity of fifty miles on one charge, furnishing the necessary energy. A concern which had a short but merry life was the Electrical Undertakings, Limited, of Camden Town, which built a number of electric cars on the Leitner system. The vehicles were of an attractive appearance, and were each fitted with two motors of the Lundell type; they came into considerable temporary prominence owing to one of them successfully making the journey from London to Brighton on one charge at an average speed of just over eleven miles per hour. A Riker electric dog-cart, an American-built vehicle, was shown by the Mackenzie Carriage Works, whose factory in Lambeth is now occupied by the Darraq Company, and the Crowdus Accumulator Syndicate had an electric parcels delivery van on view, the electrical energy in this case being provided by a battery of Crowdus accumulators. Mr. J. H. H. Berkeley attracted much attention with a single-seated electric bath chair, which can be seen in the picture showing the Arena at the 1899 Exhibition; while the Elieson Lamina Accumulator Syndicate, Limited, had on view an Elieson-Swan two-seated electric dog-car, mainly notable for the peculiar design of the driving chain.

A keen struggle for supremacy was still taking place between

The Star Car of 1898-99.

the petrol and the electric car. The former was noisy, while the latter was extremely quiet in operation; on the other hand, the petrol machine could travel the length and breadth of the land, whilst its rival was confined to short runs of from twenty-five to thirty miles. The outcome of the struggle was the production of the combination petrol-electric vehicle, in which the internal combustion engine is retained to furnish the necessary power. By means of a dynamo this is converted into electrical energy, which is utilised to operate one or two electrical motors connected with the rear wheels. The engine could thus be run at a constant speed, and the power transmitted to the vehicle without the employment of a clutch or change-speed gear-box. The idea has long been an attractive one to engineers, and it is safe to say that the last has not been heard of the "combination" vehicle. In fact, the Auto-Mixte—the forerunner of which, the Pieper, made its appearance early in 1899, is at present being built in Belgium. In Austria some developments are in hand in connection with the Lohner-Porsche system, and at home Messrs. Hart and Durnall are about to bring out a car which will comprise a number of special features.

Heavy steam vehicles formed a prominent feature of the Agricultural Hall Show. At that time wagons were restricted to a tare weight of 3 tons, and machines of this type were exhibited by Messrs. Thornycroft and Messrs. Bayleys, Limited, these forming the nucleus of the big display that is now annually made in the Minor Hall at the Agricultural Hall Exhibition.

Of public service vehicles propelled by steam the exhibits comprised a fourteen-seated wagonette, a twenty-eight-seated double-deck 'bus built by the now defunct Liquid Fuel and Engineering Company, and a twenty-seated steam 'bus, the chassis of which was made by the Lancashire Steam Motor Company, and the body by Stirlings Motor Carriage Company, of Hamilton, N.B. New-comers in the heavy steam vehicle world were the Simpson and Bodman, built in Manchester by a firm of that name, and the Sheffield Motor Dray and Engineering Company, Sheffield.

The pleasure steam cars included the Serpollet and the Whitney. The latter was an American-built vehicle; it was driven down from Liverpool by Mr. Whitney, its designer and builder, and its appearance in the arena at the show caused quite a sensation. Everyone was anxious to try the new vehicle, which, by reason of its light lines and low build, was of exceedingly attractive design. Messrs. Brown Bros. took up the car and pushed it for some time, but we believe that the concern which built it in America was eventually bought up by and merged in the

this country which proved capable of competing with any measure of success with Continental makes. It is interesting to note that its frame was built up of channel section steel, a practice which became general a few years later. The builders, the Wolseley Sheep Shearing Machine Company, had, under the guidance of Mr. H. Austin, long been devoting attention to motor-vehicles, the first machine being constructed in 1895-6. It was a light three-wheel vehicle built on cycle lines, and provided seating accommodation for the driver and one passenger. The motor, which gave about 2-h.p., was located at the rear of the driver's seat, and was provided with electrical ignition. In 1897 another three-wheeled vehicle was constructed having a single wheel in front, the car being steered by a tiller working in a ball head similar to that employed in bicycles of the present day. The horizontal motor had two cylinders arranged side by side, and developed about 3-h.p.

The increasing output of motor-cars had begun to give rise to many subsidiary industries, Messrs. Rubery and Co., of Darlaston, for instance, having taken up the manufacture of channel

28-seated Double-deck Electrical 'Bus, Spitzlin' service in Berlin in 1899.

Locomobile Company. This was quickly followed by the Locomobile originally known as the Stanley, an American light steam vehicle which for two or three years occupied a very prominent place in British motoring circles.

The addition to the list of British motor-car firms in 1899 included the Lanchester Motor Co., whose vehicle comprised then, as it does to-day, a number of novel features, chief among which were its horizontal air-cooled engine, its change-speed gear and worm gear drive, this being the first car to be fitted with this form of transmission. The completion of the first Napier engine, built by Messrs. D. Napier and Sons at their works in Lambeth, took place early in the summer of 1899. It was of the vertical two-cylinder type, the dimensions being 4 in. bore by 6 in. stroke. It was fitted to Mr. S. F. Edge's Panhard—a vehicle which was driven by M. René de Knyff in the Paris-Marseilles race of 1896, in which it finished second. The year 1899 also saw the production of the first Wolseley four-wheel car, which is claimed to be the first motor-vehicle designed and built throughout in

steel frames. Mr. R. Lucas brought out an ingenious system of infinitely variable gear obtained by means of a belt working on two special pulleys, which was so arranged that the diameters of the same could be altered as desired, the one increasing as the other was reduced. Various modifications and improvements have since been introduced, but the system never came into really extensive use, although it is still fitted to the French-built car, the Foullaron.

French motor-car builders have always looked upon races as a means not only of attracting public notice, but also of tending to bring about constructional improvements, and in this connection 1899 proved a busy year. In the Paris-Bordeaux race sixty-five competitors started, the horse-power of the machines ranging from 3 to 18½ h.p. Charron, on a 12-h.p. Panhard, was the winner, his speed working out at just under 30 miles per hour, as against the 23½ miles achieved by De Knyff in the preceding year. The Paris-Ostend race, which was run off in September, attracted great attention in this country by reason

of the fact that the competitors in the touring section included two British motorists, the Hon. C. S. Rolls, who secured second place on an 8-h.p. Panhard, and the Hon. J. Scott Montagu, now Lord Montagu, on a 12-h.p. four-cylinder English Daimler, who was third. In the racing section, Levegh, on a Mors, and

of no less (these were the words used in the *M.C.J.* at the time) than 23-h.p. The machine must have been looked upon as dangerous even by its builders, for it was fitted with six brakes — "two on the rear axle, two on the extension of the motor shaft, and two on the intermediary shaft." M. Vallée, of Le

The Vivinus 3½-h.p. Car (1899.)

Girardot, on a Panhard, tied for the first place, their time for the 201 miles being 6 h. 11 min. Short-distance speed trials also became popular, and the record was broken week after week, Beconnais, who rode a Phebus motor-tricycle, finishing up the year with the flying kilometre in 48 sec., equal to nearly 47 miles per hour, to his credit. Races

Mans, who had been turning out small belt-driven cars for some years, in 1899 produced a novel racing machine, the body of which was of the shape of a large shoe. The car was fitted with a 16-h.p. four-cylinder horizontal engine, but was totally devoid of driving chains and change-speed gear, the power being transmitted directly to the rear axle by a single wide belt. The

The Decauville 3-h.p. Voiturette, 1899.

and speed trials had begun to assume such importance that in 1899 the German Daimler Company decided to take up the construction of racing cars. The first vehicle, which bears little or no resemblance to the succeeding Mercedes racers built in the same factory, was fitted with a four-cylinder motor

vehicle was driven by Dr. Lehweß in the Paris-St. Malo and Paris-Ostend races, in which it attained an average speed of about twenty-five miles per hour.

The great increase in the number of motor-vehicles in France had already begun to cause some anxiety as to a con-

tinuance of the supply of petrol, and attention was directed to the question of other fuels. Liquid air, carbonic acid, acetylene and alcohol each received notice; the three former were quickly put out of court, but the latter, although not yet fully established, gives promise of developments in the not distant future. As regards the general improvement in petrol cars, radiators, consisting of a serpentine coil of pipe, to the exterior of which heat-radiating flanges were secured, were now forming a standard fitting, their large size and clumsy shape being in

A Krieger Electrical Coupe 1899.

strange contrast to the neat combination of radiator and tank in use to-day. In connection with this subject of water cooling much interest was aroused in the system Mr. Ernest Estcourt, one of the early motorists of the country, fitted to his Daimler car, in which the circulation was maintained by gravity, and the employment of a water-circulating pump—very troublesome devices in those days—obviated. The ignition question was in a state of development, interest in the subject being increased by the fitting of a Simms-Bosch low-tension magneto to a Beeston motor-tricycle. Both at home and in France the electrical system by means of a coil and either a dry battery or an accumulator was rapidly coming into use, although one expert expressed the opinion that "taking our climate and roads into consideration, and for ordinary travelling purposes, tube ignition is the most simple, practicable and economical method." An improvement in steering gears which dates from 1899 was the adoption of the twin nut and screw type by Panhard-Levassor. Wheel-bases were still extremely short, 5 ft. 6 in. in the case of the 5½-h.p. Daimlers, a proposed increase to 7 ft. being looked upon as a decided venture.

### 1900.

Activity again ruled in 1900—the year of the great 1,000 miles trial, to which reference is made elsewhere. In France the old makers were turning out cars of larger and larger horsepower, one of the most successful of the year being the racing car brought out by the Mors Company, which was fitted with an engine of about 32-h.p. The example set by the Renault and De Dion voiturettes also brought forward an extensive new range of cars, among which were the 6-h.p. single-cylinder Darracq voiturette with cardan shaft drive on to a live axle, the Creanche, the Gladiator 3½-h.p. voiturette with cardan shaft transmission, this being followed towards the end of the year by an 8-h.p. vehicle.

In Germany the Daimler Motoren Gesellschaft devoted much attention to the construction of what, in those days, were considered high-powered racing cars. For the 1900 Nice races a 28-h.p. car was built, but the forerunner of the present Mercedes first saw the light towards the end of 1900. It was fitted with a 35-h.p. four-cylinder engine, which had low tension magneto ignition, a governor acting on the inlet, an improved carburettor, and honeycomb radiator—all features that have been retained, although improved in the details.

Coming to the United Kingdom, a considerable addition was made to the list of motor-car firms, while the older concerns brought out improved vehicles. At the Cordingley Show at the

Agricultural Hall, Islington, which was held from the 14th to the 21st April, 1900, and which was under the auspices of the A.C.G.B.I., one of the features was the display by the Daimler Motor Company, Ltd., of the first English-built Daimler to have inclined wheel steering and electric ignition. The vehicle was also fitted with pneumatic tyres. Later in the year the Daimler Company introduced a 20-h.p. four-cylinder, with both tube and electric ignition, and provision for easing the compression to facilitate starting. A 16-h.p. car was also turned out, in which roller bearings were employed as well as water-cooled brake-drums. The Motor Manufacturing Company, Ltd., had a large and varied exhibit, ranging from motor-bicycles to large public service vehicles. Their standard pleasure cars were now being turned out with wheel steering and the change-speed lever at the side. Towards the end of the year they introduced the first of the well-known 5-h.p. single-cylinder M.M.C. cars. The general design was on Panhard lines—in fact, the vehicles became known as miniature Panhards.

The year 1900 saw the production of a greatly improved Wolseley car. It was of 4½-h.p., its horizontal engine driving through a clutch and Renold silent chain to the gear-box, and thence by side chains to the rear road wheels, a great feature being made of the fact that all the shafts were parallel with the axles, the employment of bevel gearing being in this way avoided. The construction of Wolseley cars had up to this time been carried out by the Wolseley Sheep Shearing Machine Company at their works in Alma Street, Birmingham, but following on the car's success in the 1,000 miles trial the demand became so great that it was necessary to immediately establish separate works to deal with the orders for motor-cars. It was at this time that Messrs. Vickers, Sons, and Maxim acquired the automobile branch of the business from the Sheep Shearing Company, a new company being formed under the title of the Wolseley Tool and Motor Car Company, Ltd., and located at Adderley Park, Birmingham. From this time upwards the company has been steadily extending its works, the various

The 1899 6-h.p. M.M.C. Car.

shops and the chief works at Adderley Park now covering a total area of 11 acres, while in addition another large factory covering 22 acres situated at Crayford, Kent, was acquired in 1903, the total number of employees being close on 3,000. In 1903 the Wolseley Company undertook the design and manufacture of cars to the specifications of Mr. J. D. Siddeley, whose business they acquired early in 1905.

Although Messrs. Napier built their first engine in 1899, it was not till the following year that a complete Napier car was produced. This was an 8-h.p. two-cylinder vehicle, the arrangement of which was on Panhard lines. This was quickly followed by a 16-h.p. four-cylinder car, which, in the hands of Mr. S. F. Edge, who commenced his automobile career on a De Dion motor tricycle, quickly became a well-known vehicle. The 8-h.p. car-

The Renault Voiturette, 1900 Model.

had a wheel base of 8 ft. 6 in., that of the 16-h.p. being 9 ft. 4 in. The year 1900 also forms the starting point of what has become one of the largest concerns in the country. We refer to Argyll Motors, then known as the Hozier Engineering Co. We give an illustration of the first car turned out, with Mr. Alec Govan, whose association with the concern dates from its initiation. The vehicle, which was largely a copy of the Renault, was fitted with a 2½-h.p. De Dion engine, the head of which only was water cooled. Later in the year an improved machine, with a 5-h.p. water-cooled engine, was turned out, the water circulation being on the thermo-siphon system. Another addition to the list of British motor-car manufacturers in 1900 was the Albion Motor Car Company, Ltd., of Glasgow. Like many other makers at this time, choice fell upon the horizontal type of engine. The vehicle was of 8-h.p., and, as will be seen from the illustration we give, it bears but little resemblance to the modern car now turned out by the same concern.

The Automobile Association had again a large exhibit at the Agricultural Hall, prominent among which was a 3-h.p. De Dion voiturette fitted with a four-seated body, a 10-h.p. six-seated Mors phaeton fitted with a two-cylinder vertical engine and a segmental friction clutch, and a 10-h.p. Ducroiset car in which the horizontal motor was fitted in front. Messrs. Friswell, Ltd., in addition to motor-cycles, exhibited Renaults, the Mors Petit Duc, Delahayes, and an 8-h.p. Peugeot. Mr. E. W. Hart brought from France a new light car known as the Sirene; this was of 4-h.p., and had a two-cylinder V-type engine which drove a live axle through a gear-box and cardan shaft. The Star Cycle Company, in addition to their Benz-type machines, produced a 6-h.p., gear-driven vehicle, fitted with a double-cylinder vertical engine at the rear.

Messrs. Stirling, of Hamilton, introduced a new series of 5-h.p. and 7-h.p. light cars. Small cars were also brought out by the Progress Cycle Company, who were making motor-cycles, and whose small car had the engine under the seat at the rear; the Pollock Engineering Company, who built the 7-h.p. Turrell car, the engine of which was started from the seat; Messrs. Alldays and Onions (2½-h.p. Alldays Traveller), Messrs. E. Hutton and Co., Northallerton (5-h.p. Simplex), Mr. F. W. Hudlass, Southport (7-h.p. Hudlass, with belt and chain drive and with a separate lever for each of the three speeds), the Humber Company, Ltd. (a 3½-h.p. two-seated doctor's car), Messrs. J. H. Pick and Co., Stamford (a 2½-h.p. air-cooled two-seater), Messrs. James and Browne (a small 3½-h.p. car with horizontal engine); the Centaur Cycle Company (a 4½-h.p. dog-cart with belt transmission); the Victrix Motor Car Works, Kendal; Mr. Dan Albone, Biggleswade; the Eadie Manufacturing Company, who

built a car on the lines of the Renault; and the Yorkshire Motor Car Company (4-h.p. Jackson car).

The event of the year in the motor-cycle world was the appearance of the first Minerva 1½-h.p. motor-bicycle, with the engine attached in a sloping position to the lower cross tubes of the frame. The Singer Cycle Company brought out the Singer motor-bicycle, in which the engine was ingeniously built up in the rear wheel; while Messrs. Marshall and Co., in addition to their 5-h.p. dog-carts and phaetons, took up the construction of a new motor-tricycle known as the Renault, the feature of which was the fitting of a horizontal engine. To the list of electrical vehicles on the English market was added the Lobner-Porsche (Austrian) cars, which were brought to this country by Mr. E. W. Hart. Messrs. Shippey Brothers also attracted attention to a new series of Canadian-built electrical cars built on the Still system. In the heavy steam vehicle section the Lancashire Steam Motor Company, Ltd., brought out a new and improved wagon, in which coke was used in place of liquid fuel.

The death of Herr Gottlieb Daimler, who was looked upon as the father of the motor-car, took place at Cannstatt on March 6th, 1900, at the age of sixty-one.

## 1901.

One feature of the year 1901 was the increase in the horsepower of the cars built by the old-established firms; another was the large number of voiturettes brought out, especially in France, to compete with the De Dion and Renault, while a third was the appearance of a new type of light car, intended as a kind of half-way between the voiturettes and the heavier touring vehicles. Prominent in the new category were the 5-h.p. and 7-h.p. Panhard, in which the Centaure change-speed gear controlled by a single lever was employed. Wheel steering was now practically universal, and the majority of engines were fitted with both tube and electric ignition. Inlet valves were of the automatic type, but the coming of the mechanically-operated valve was foreshadowed by the appearance

The Locomobile Steam Car (1900) with Mr. Staplee Firth at the wheel and Mr. C. Cordingley as passenger.

of the David-Bourgeois 16-h.p. four-cylinder car at the Paris Salon in February, in which this type was adopted. At this show, too, the metal-to-metal clutch made its appearance on a 32-h.p. racer built by Messrs. Audibert and Lavirotte, of Lyons. The tonneau type of body was now the leading pattern, and it was in 1901 that the term "Roi des Belges" came into vogue,

the first car with a body of this type being delivered to the King of the Belgians in March, 1901, by Messrs. Rothschilds, of Paris. Covered cars were, however, becoming more common, coupés driven from the inside and limousines being put on the market by, to name only a few firms, Renault, Panhard, and Georges Richard. The Mors Company's principal departure consisted in the production of a 10-h.p. four-cylinder car, in which only the heads of the cylinders were water-cooled. Other features of interest were the adoption of low-tension magneto ignition and the control of the speed of the engine by a throttle on the inlet and the provision of what has come to be known as a foot accelerator, by means of which the governor can be put more or less out of action.

An indication of the coming triumph of the gear and chain-

towards the end of the year its 1902 model, in which it fell into line with other prominent builders by placing the engine in front instead of at the rear, a similar step being taken by the Peugeot Company, who built a 7-9-h.p. double-cylinder machine on these lines. New additions to the list of voiturettes were found in the Rochet, Corre, and Vinet, while in the light car section fresh names were found in the Vinot-Deguingand, Renaux, Tourand, Hautier and Ador, to mention only a few.

The great success of the Mercedes 35-h.p. cars at the Nice race meeting brought these vehicles into the front rank, and resulted in the production of even higher powered cars for the Paris-Bordeaux and Paris-Berlin races, which took place in that year, they ranging from a 40-h.p. Panhard to an 80-h.p. chain-driven Darracq, and including a 50-h.p. Napier, the largest car

Mr. S. H. Pearse on the first complete 8-h.p. Napier car, reproduced from a photo taken in the summer of 1900.

driven car over that driven by belts was afforded by Messrs. Rochet-Schneider abandoning belt-driven vehicles and bringing out a 12-h.p. four-cylinder car on Panhard lines. A similar tendency was also making itself felt in this country. Cars with live axles more especially quickly grew in number, the popularity of this system of drive being one of the features of the exhibition. No doubt the facility it offered for entirely closing all the driving gear was the chief cause that led to the result, but manufacturers had still much to learn as regards the building of live axles of suitable design and strength to withstand the work to which they were subjected. The De Dion, Renault, Gladiator, Decauville, and Darracq cars, in which minor improvements were effected and slightly larger engines adopted, continued great favourites. The first-named concern brought out

so far built in England, and which competed in the first-named event. The honours of the year fell, however, to the Mors concerns in the heavy racing car class, and in the lighter category to the Renault.

The annual exhibition at the Agricultural Hall, held from April 14th to 21st, proved the largest of the series up to that period, the Minor Hall and galleries being used for the purpose of exhibits for the first time, and the arena still a feature of the show. All the principal British firms, including the Daimler, M.M.C., Napier and Wolseley cars were on view, as were also the leading French, German, and Belgian vehicles. Newcomers from France included the Bardou car, which was brought over by M. Ramois, and the feature of which was the special form of single-cylinder double piston horizontal engine and the some-

what complex system of transmission. The De Dietrich cars, with horizontal engines, and belt and gear transmission, were also seen for the first time at an English show. The Daimler Company turned out from its works at Coventry several types of cars ranging from the Kimberley 4½-h.p. dog-cart, in which the transmission was by a combination of belt and spur gearing, up to a 20 to 25-h.p. four-cylinder machine, the most noteworthy departure being a 7-h.p. light car with a double-cylinder engine and

Mr. E. J. Coles on the Benz Car he drove in the 1,000-miles Trial, 1900.

cardan shaft drive. The Motor Manufacturing Company, Ltd., also took up the construction of light cars, building a 7-h.p. tonneau, and at the end of the year turned out a 16-h.p. car, which participated in the anniversary run to Southsea. Messrs. Friswell, Limited, who were still handling Mors and De Dion cars, gave prominence to the Peugeot vehicles, one of which was a 20-h.p. racer. The Hozier Company introduced a tonneau car, fitted with a 5-h.p. M.M.C. engine. The Wolseley Company made a feature of a 10-h.p. double-cylinder car—an enlarged model of the vehicle of the previous year, and later in the year brought out a 20-h.p. car. The Star Company, while still making its belt-driven car, introduced a 6-h.p. double-cylinder cardan shaft car, somewhat on the lines of the Darracq, a departure which was also made by Messrs. Marshall and Co., who exhibited an 8½-h.p. gear-driven car at the Agricultural Hall. Messrs. Dennis Brothers' advance consisted in the production of a 6-h.p. single-cylinder and an 8-h.p. double-cylinder gear-driven car, the latter having a direct drive on top speed. On the last day of the Show much interest was aroused by the arrival of a new petrol car, the Wilson and Pilcher, which from the point of view of quiet running was a great advance. The vehicle, which was gear-driven, was fitted with an 8-h.p. motor, which comprised four horizontal cylinders, set in pairs on opposite sides of the crank shaft.

New additions to the list of makers of small British cars at this time included Parr, of Leicester, who built a 5-h.p.; the Enfield Cycle Company, who utilised the Ader V type engine; Messrs. Durham, Churchill and Co., whose "Hallamshire" car was fitted with a 7-h.p. Simms engine; the Swift Cycle Company, a 5½-h.p. single-cylinder three-seated machine, in which chains were employed to convey the power from the engine to the gear-box, and also from the latter to the live axle; Messrs. R. M. Wright and Co., Lincoln, a 5-h.p. belt-driven machine, the Metropolitan Motor Manufacturing Company, a two-cylinder car with belt and chain drive; the Rex Company, a 6-h.p. gear-driven vehicle; the Imperial Autocar Manufacturing Company, a 3½-h.p. vehicle with bevel gear transmission, the Wellington Motor Car Company, of Battersea, a small car, a noticeable feature of which was the employment of ball bearings on the crank shaft; Messrs. Eastmead and Biggs a 3½-4-h.p. voiturette; the Eclipse Machine Company, a 6-h.p. Rothwell car; and Messrs. J. Marston, who had previously made an improved form of Benz car, brought out a strange-looking two-seated vehicle, known as the Mabley, which

was fitted with a 2½-h.p. De Dion engine. A novel experimental car, in which the drive was by means of a special belt working on expanding pulleys, was also made by Mr. Holroyd Smith. As regards motor-cycles, the introduction of the Minerva at the end of the previous year gave a great impetus to motor-bicycles, the construction of which was taken up by a large number of the principal cycle manufacturing concerns, the old tricycle and quads losing favour proportionate to the advance of the new two-wheel rival.

In the electrical section the advent of the City and Suburban Electric Carriage Company was the chief item of interest. Their cars were of American construction, and included a variety of types, ranging from a small victoria for Queen Alexandra to a large station omnibus. The company introduced a system by which the carriages were garaged and maintained by the company for the owners, which resulted in a large number being brought into use. Other new arrivals in this section included the Scheele carriages, and with the view of popularising this type of vehicle a good deal of attention was devoted to the establishment of long-distance runs.

In the steam car department the principal event of the year was the appearance of an American steam car known as the White, the first one of which was built in 1900. It was a 6-h.p. two-seated runabout, equipped with a simple two-cylinder engine. The boiler consisted of eleven coils of 3-8 in. seamless drawn steel tubing, so arranged that water was pumped into the top and superheated steam taken out of the bottom. The control was automatic, the fire being regulated by temperature and the water by steam pressure. It was the first boiler made which could be run dry of water at any time without the slightest danger of damage. Although outwardly the modern White steamer bears little resemblance to the original vehicle, the system of steam generation has remained the same, and it may be added that the White is the only one of the many steam cars which came from America about this period that has survived the onward march of the petrol vehicle. A full range of Serpollet vehicles were displayed at the Show, M. Serpollet coming over from Paris to assist in making their advantages known in this country. M. Chaboche, who had for some years built heavy steam vehicles, also brought out two light touring cars. The Loco-

The Wolseley Car of 1900.

mobiles were at the height of their popularity, their quiet running still continuing to attract considerable attention. The question of vehicles for commercial purposes was also receiving more attention. Messrs. Hewetson introduced a number of Benz lorries of 6-h.p., 10-h.p., and 14-h.p., with that firm's combined belt and chain transmission. A five-ton Milnes-Daimler wagon took part in the War Office trials towards the end of the year, and light vans were built by the Wolseley, Napier, M.M.C., and other concerns. Further progress was made in the heavy steam vehicle world, new wagons being brought out by Mann's Steam Cart and Wagon

Company, Leeds; Messrs. C. and A. Musker, Liverpool; Messrs. Foden and Sons, and of Sandbach; the Yorkshire Steam Wagon Company, Leeds; the Straker Steam Vehicle Company, who also built a 'bus.

The record of the year 1901 would be incomplete without a reference to the litigation which took place in respect of the Maybach patents, the owners of which—the British Motor

The first car built by the Albion Motor Car Company, Ltd. The car, which was put on the road in June, 1900, was fitted with an 8-h.p. double-cylinder horizontal engine.

Syndicate—claiming that the majority of the carburettors in use at the time were infringements of their rights. Writs were issued freely, the result being the formation of the Automobile Mutual Protection Association, which successfully defended the action brought against one of its members.

## 1902.

The year 1902 was one of considerable importance from the point of view of the development in the design of the cars, as well as in the trade that was done. Some idea of the latter may be gathered from the fact that within the twelve months the value of the foreign motor-cars imported into this country attained a value of £1,045,689. As regards the vehicles themselves, features which are now found in the majority of modern cars began to make their appearance, such as, for instance, the pressed steel frame, which commenced to supersede the armoured wood type, metal to metal clutches and brakes, mechanically operated inlet valves, push pedals, gate control of the change-speed lever, governing on the inlet, &c., while honeycomb radiators were becoming more generally adopted. The Eisemann high-tension magneto made its debut, and began to compete with the low-tension make-and-break system.

The principal car of the year was the new 40-h.p. Mercedes Simplex, brought out by the German Daimler Company, and which proved invincible in the contests in the South of France in the spring. It had all the features set out above as being new departures, the clutch also being of a special expanding metal type. Two of the earlier cars of this type in this country were those owned by Sir Alfred Harmsworth (now Lord Northcliffe), and Mr. C. Cordingley. In long-distance racing circles the event of the year was the Paris-Vienna, for which 205 entries were received, and which was won by a Renault. In conjunction with the event was run the Gordon Bennett contest, which, as is now well known, proved a victory for Mr. S. F. Edge on a Napier car. In France the horse-power of the touring cars steadily advanced, one year's racing car usually becoming the touring car of the succeeding season. Messrs. Panhard and Levassor's prin-

cipal departure was the construction of engines with steel cylinders and separate brass water jackets. The De Dietrich Company abandoned the belt and brought out 6-h.p. and 12-h.p. cars, in which, although the horizontal engine was retained, the transmission was either by cardan shaft or side chains, both models being made. Later in the year a 30-h.p. touring car was produced. M. Léon Bollée created some excitement at the 1901 Paris Salon with a "frameless" car. The De Dion and Renault Companies were building 8-h.p. cars, the Decauville Company produced a 20-h.p., the Georges Richard Company a 20-h.p., and the Peugeot Company a 12-h.p., with honeycomb radiator and the contact-maker on the dashboard. The last-named concern also introduced the 5-h.p. Baby Peugeot, which became, through the energies of Messrs. Friewell, extremely popular in England.

Coming to the English motor industry, at the annual show held in the Agricultural Hall in April, 1902, and at which the Prince of Wales was an interested visitor, the rapid growth of the industry necessitated the abandonment of the arena, which had proved so great an attraction in the three preceding years. The Daimler Company entirely remodelled their vehicles, the new 12-h.p. being a distinct improvement on their former productions, and forming the forerunner of the present successful vehicles. A 22-h.p. car for His Majesty the King was also turned out by the Daimler Company this year. The success of the Napier in the Gordon Bennett race naturally gave this make of car a great impetus; the Wolseley Company were building cars with horizontal engines up to 20-h.p.; Messrs. Marshall and Company built a 12-h.p. car with live axle; the Century Engineering Company, who had hitherto devoted attention to their tri-car, or tandem, as it was known, turned out a 9-h.p. car; the Humber Company introduced new 8-h.p. two-cylinder and 12-h.p. four-cylinder, gear-driven cars; the Star Company were constructing vehicles up to 20-h.p. on Panhard lines, and the Argyll Company gear-driven vehicles up to 11-h.p.; Messrs. Dennis Brothers were producing cars up to 10-h.p. with double-cylinder engines; while the Sunbeam Company introduced a 12-h.p. four-cylinder Sunbeam with ash and steel frame.

The Stirling Motor Carriage Company acquired large works at Granton, and took up the construction of 12-h.p. lorries and single-deck 'buses, a number of the latter being put in service in London. Messrs. J. W. Brooke and Company, an old engineering firm, which had started in the motor trade at the end of 1901, introduced their first vehicle, a 10-h.p. three-cylinder car, in which the transmission was entirely by chains.

New-comers in the petrol car branch included the Protector Lamp Co., who built a small two-seater, the Vulcan Motor Com-

"A Speed King" Motor Quad built by Messrs. Dennis Bros. in 1900.

pany, Southport, Messrs. Horsfall and Bickham, who commenced their career with a 6-h.p. Horbick car, the Speedwell Engineering Company, the Maudslay Motor Company, who built a 20-h.p. car, in which an overhead cam shaft was employed, Messrs.

Hurst and Lloyd, and many others, while from America came the Oldsmobile 4-h.p. two-seated runabout.

In the pleasure steam car section a new-comer was the Miesse. This was of Belgian origin, its construction in this country being eventually taken up by Turner's Motor Manufacturing Company, Wolverhampton. The White steam car—a 6-h.p. vehicle—made its appearance at the show for the first time, and proved a serious competitor to the Locomobile. Excellent progress was made with the adoption of heavy steam wagons, new builders of the same being Messrs. Jesse Ellis, Limited, and the Creek Street Engineering Company.

### 1903.

The most striking feature of the year 1903 was the birth of the automatic carburettor. This became one of the most discussed topics of the hour, being started by the introduction by the Panhard Company of the famous Krebs apparatus. In this the quality of the mixture was controlled automatically by means of an extra valve, combined with which was a rubber diaphragm and spring, on which the suction of the engine acted, and in accordance with the speed of the latter caused the valve to open more or less to admit the requisite amount of additional air to the mixing chamber. So successful was this that all the leading manufacturers centred their attention on the production of automatic carburettors, and some very ingenious contrivances resulted. It is from this departure and the general adoption of multi-cylinder engines, the speed of which was controlled by throttling the admission of the explosive mixture, that the modern silent petrol car really dates. Great attention was being paid to the question of suitable steels for the construction of motor-cars, with the result that the weight was cut down con-

The Lawson Motor Wheel, 1900.

siderably, vehicles even up to 50-h.p. weighing little over a ton, and yet much stronger than the old 12-h.p. models, which turned the scale at over 30 cwt. The four-cylinder engine was now the most popular type, and the mechanically-operated inlet valve had so rapidly advanced into favour that at the 1903 Paris Salon

nearly 70 per cent. of the engines were so fitted. Governing on the inlet had almost entirely superseded the system of control by throttling exhaust. Rumours of threatened litigation in connection with honeycomb radiators, and the great improvement in the older form of ribbed tube cooler, brought a slight reaction

Mr. C. Jarrott on his 8-h.p. De Dion Motor-Bicycle, on which he rode forty-two miles in the hour on the Canning Town Track, in October, 1900, beating all records.

in favour of the latter. Pressed steel frames, although still in the minority, were rapidly displacing the armoured wood and tubular type, and another matter of note was the rapid increase in the number of cars with live axles and driven through cardan shafts and bevel gear, the proportions being 45 per cent. as against 55 per cent. chain-driven machines, which latter had, however, dropped from 62 per cent. in 1902. Magneto ignition was also being more largely used, but was still by no means general, and in connection with the high-tension method by coil and accumulators it may here be mentioned that "spark-gaps," accidentally discovered in the testing department of Messrs. Panhard and Levassor, enjoyed a short but merry life. The disc clutch as introduced by Professor Hele Shaw attracted notice. Wheel bases became longer, and side-entrance vehicles began to displace the previously dominant tonneau type. Shields below the engine and gear-box to protect these parts from being bespattered with mud were freely adopted, the Darracq and Decauville combining the same with their pressed steel frames. The mania for racing—for such it had become—received a great set-back by the disastrous result in the way of fatalities of the memorable Paris-Madrid race, which took place in the summer of this year, and which was peremptorily stopped at Bordeaux by the French Government at the end of the first day.

The Mercedes car, which was being built in a number of sizes, ranging from 18-h.p. to 90-h.p., was further improved—one departure being the employment of H-section axles—and easily held the premier position in the motoring world. The works of the German Daimler Company at Cannstatt, in which the vehicles were built, were burnt down in June, and operations immediately commenced on the erection of new ones at Unterturkheim. Although still building belt-driven machines with horizontal engines, the Benz Company at last introduced a gear-driven car—a 10-h.p. two-cylinder vehicle with vertical motor—followed in subsequent years by powerful four-cylinder cars up to 60-h.p. From Germany also came the Maurer Union car

with its friction drive, an arrangement which had been tried by many designers even as far back as 1895.

All the leading French builders brought out larger and improved cars, the Panhard Company also introducing the now well-known 8-h.p. (normal) three-cylinder vehicle. Interest was evinced at the end of the year in the appearance of the first Hotchkiss car, which was, however, not seen in England until the following spring. Two types were made—20-h.p. and 35-h.p.—both having live axles, their most striking departure being the fitting of ball bearings to the engine crank shaft as well as in the gear-box and on the axles. The modern Léon Bollée car also made its *début* at the 1903 Paris *Salon*. Following closely on Mercedes lines, its notable feature was the adoption of three-point suspension, both for the engine and the gear-box. The De Dietrich Company introduced a new type of car, built in accordance with the designs of Messrs. Turcat-Mery, the transmission being through a clutch, gear-box, and side chains. The Mors Company's main departure lay in the gear-box, in which two pairs of bevel gears were employed to convey the power to

trasting strangely with the more popular type of car. The 1903 models of the Daimler Company included 14-h.p. and 22-h.p.; armoured wood frames were still employed, although the wheel base had been lengthened, while tube ignition was finally discarded in favour of electric. The Napier models included 12-h.p. light, 16-h.p., and 20-h.p. cars; the Wolseley Company had vehicles up to 50-h.p.; and the Motor Manufacturing Company had cars up to 20-h.p., in which latter the pinions of the change-speed gear were always in mesh. Messrs. Brooke and Company, in addition to their entirely chain-driven cars, produced a 15-h.p. light three-cylinder machine with the Panhard system of transmission; the Argyll cars were marked by the provision of the Govan change-speed gear, a feature still adhered to in these cars; Messrs. Thornycroft and Company took up the manufacture of petrol cars, their first production being of 10-h.p. and 20-h.p., both having live axles; the Albion Company gave up its horizontal engine car in favour of a new chain-driven design with a 12-h.p. double-cylinder vertical engine located in front. All the valves were mechanically operated, and magneto ignition was fitted;

The Orient Express Car of 1900.

the differential shaft, one being used for the direct speed and the other for the intermediary gears. Messrs. Vinot-Deguingand were among the earliest to build a small four-cylinder car, producing a 10-h.p. vehicle; the Delahaye Company introduced cars up to 24-h.p., with vertical engines; and the Clement-Talbot vehicles came into prominence. Messrs. De Dion, in addition to their pleasure cars, took up the construction of petrol lorries and vans, in place of the steam vehicles they had hitherto built. Messrs. Chenard and Walcker's 10-h.p. and 14-h.p. cars had an ingenious variable lift to the inlet valves and a novel system of transmission through pinions on the end of the differential shaft, which engaged with spur-rings attached to the rear road wheels. A great "draw" at the Paris *Salon* was the C.G.V. 40-h.p. eight-cylinder direct-driven car, in which the gear-box was abolished, the drive being direct. The idea, however, was not persisted in.

One of the novelties at the Agricultural Hall Show held in April, 1903, was the display of the Arrol-Johnston vehicles by the Mo-Car Syndicate, the novel appearance of their high-built dogcarts with two-cylinder four-piston horizontal engines con-

Messrs. Dennis Bros. introduced a spring drive in their 12-14-h.p. and 16-20-h.p. cars, a feature which is still retained; and the Milnes-Daimler Company began to devote great attention to petrol lorries and motor-buses. The Belsize Company (formerly Messrs. Marshall and Company) produced a three-cylinder 20-h.p. car in which the valves, both inlet and exhaust, were located in the cylinder head, all being mechanically operated; the Humber Company introduced, in addition to their larger cars, the 5-h.p. Humberette, a little single-cylinder car, which by reason of its relatively low price became very popular; the Swift Motor Company built an improved form of two-seated car in which the change-speed gear was all contained on the rear live axle. Additions to the list of British motor-car builders included the Ryknield Engine Company, who had established works at Burton-on-Trent; the Ariel Motor Company (10-h.p. and 16-h.p. cars with live axles); the Velox Motor Company, Coventry (a 12-h.p. live-axle car); the Phoenix Motor Company, Southport, who made a 12-h.p. car; the Vauxhall Ironworks Company, a 5-h.p. vehicle with horizontal single-cylinder engine; the Clyde Cycle and Engineering Company, Leicester; and the Ridley Auto-car

Company, a small two-seater with the change-speed gear combined with the bevel drive. In the motor-cycling world the bicycle continued to crush out the former three-wheel favourite. The old surface form of carburettor was also being displaced by the spray type, the Longuemare enjoying considerable favour. The side-car and tri-car also made their appearance.

Holland entered the lists with the Spyker cars, which were first seen in England in April, 1903, the models then being 12-h.p. two-cylinder and 20-24-h.p. four-cylinder, both with live axles. From Switzerland came the Martini cars, built under licence from the Rochet-Schneider, of which they were practically a duplicate. Belgium sent the Germain, Pipe, Deschamps, F.N., and Mathieu; and the United States the Ford, Winton, and Cadillac. Italy, too, had now entered the field of automobile construction, the Fiat Company bringing out a 16-h.p. car very largely on the lines of the Mercedes.

As regards steam cars, the White Company introduced a 10-h.p. vehicle more on the lines, as regards general appearance, of the petrol car, and in which the bevel gear-drive and wheel-steering were adopted; and the Speedwell Motor Company brought over Serpollet steamers up to 40-h.p. In the heavy steam vehicle section there were a large number of new wagons, including the Brightmore, English, Hindley, Hercules, Howard, Londonderry, Naylor, Rectory, Robertson, Savage and Wantage, &c. Messrs. Wallis and Stevens and Messrs. Tasker and Son introduced light steam tractors, and Diplock's Patent Traction Engine Haulage Syndicate, Ltd., the "Pedrail" tractor, in which the ordinary front wheels were replaced by wheels fitted with a number of "feet."

In the electrical section reports of a new wonderfully light accumulator devised by Edison gave rise to hopes of a further development in electrical motor-cars. New vehicles were introduced by the Electromobile Company, Messrs. Pritchetts and Gold, Mr. E. W. Hart, and the London Electromobile Syndicate, of which only the cars of the first-named concern are now on the market. Combination petrol-electric cars were still attracting notice, Mr. E. W. Hart introducing one, as did also the Mildé and Krieger concerns in France.

## 1904.

### THE ADVENT OF THE SIX CYLINDER.

Although four-cylinder engines were in the majority, quite a number of six-cylinder cars put in their appearance in 1904, among them being the Napier, the Sunbeam, a 16-18-h.p. vehicle with only two forward speeds and a reverse, which was not proceeded with; the Maudslay, the Ariel, the Wilson and Pilcher, and the Spyker, the latter having also the additional feature of a four-wheel drive. As if by way of contrast, a Rochdale firm built a car with a single-cylinder horizontal engine of no less than 24-h.p. Mechanically-operated inlet valves were employed on 97 per cent. of the larger cars, and the favourite design was that in which the inlets were located on the opposite side of the cylinder to the exhaust. Magnetic ignition made wonderful progress this year, increasing from only 28 per cent. in 1903 to 81 per cent., cars with accumulators declining from 72 per cent. to 19 per cent., these figures being a result of a census taken at the 1904 Paris Salon. The Simplex ignition, in which a low tension spark was formed in a make-and-break plug combined with a magnet, created much interest, and brought forward several devices on similar lines, none of which, however, have come into general use. New and novel designs of automatic carburettors continued to be produced, among others which might be mentioned being the Chenard-Walcker, the Peugeot, in which the supply of petrol through the spraying nozzle was varied as well as the air, in accordance with the speed of the engine; the Napier, in which the extra air inlet valve was regulated by water pressure, advantage being taken of the fact that the speed of the cylinder cooling water through the circulation system varies with that of the engine. Much interest was centred on the question of hand or foot control of the engine, some makers preferring to fix the throttle lever on the top of the steering wheels, and others to use a pedal or foot accelerator to work in conjunction with the

governor. The pressed steel frames were now being narrowed in front to increase the lock of the steering wheels, rendered necessary by the ever-extending wheel-base of the cars, covered and side-entrance vehicles being again a prominent feature.

The 1904 Mercedes of the German Daimler Company showed a number of changes and improvements. As regards the engines, the location of the inlet valves in the cylinder heads was abandoned in favour of the double cam shaft arrangement. The success of the vehicle in the preceding two years continued to bring forward many competitors, especially in France, a notable new-comer in 1904 being the Delaunay-Belleville 16-20-h.p. live axle vehicle and 40-45-h.p. chain-driven cars, the Berliet cars, which were very largely on Mercedes lines, and the Westinghouse also coming into prominence. The Panhard, Peugeot, De Dietrich, Darracq, Renault, Brouhot, C. G. V., Decauville, Clement-Talbot, and Gladiator all brought out improved models, although the first-named firm still adhered to the armoured wood frame. The Mors Company, who were building no less than eight sizes, ranging from 8-h.p. to 40-h.p., abandoned the use of the governor, substituting a connection between the clutch pedal and the throttle, so that the speed of the motor was automatically cut down when the clutch was withdrawn. The Richard-Brasier Company, for which Messrs. Mann and Overton's have long been the British agents, built four models of

Mr. Mawdsley Brooke at the wheel of the first Brooke Car. The vehicle was built towards the end of 1901; it was fitted with a 10-h.p. three-cylinder engine, and was driven by chains from the motor to the gear-box and again from the latter to the rear road wheels.

live axle cars, ranging up to 24-h.p., and on which no pump was employed, the water circulation being by gravity. M. Georges Richard, who had left his old concern, introduced the 12-h.p. Unic, of which a large number are now running in England, and Messrs. De Dion added a powerful four-cylinder car to their list of vehicles. The Motobloc Company of Bordeaux superseded its horizontal engine car with a more powerful one, in which the crank case of the 16-20-h.p. vertical motor was combined with the gear-box. Other new French vehicles included the Radia, the Aries, the latter having live axles in conjunction with a fixed one, and the Gregoire, a neat two-seater for the man of moderate means.

In England the year was marked by the introduction of several new cars and the completion of the large works at Notting Hill, where the Clement-Talbot cars are now being turned out. In January Messrs. Jarrott and Letts put on the market the Crossley chain-driven car, in which more than usual interest was shown, largely because of the fact that the motor was the product of Messrs. Crossley Bros., Ltd., Manchester, the big gas engine makers. The vehicle, which was built to the designs of Mr. J. S. Critchley and Mr. C. Jarrott, both of whom

The De Dietrich Racing Car of 1901.

Mr. Alec Govan at the helm of the first Argyll Car. It was built in the early part of 1901 and was fitted with a 3½-h.p. engine.

have been connected with the automobile movement since 1896, was of 22-24-h.p., and while following the general arrangement of the Mercedes comprised a number of special features, notably as regards its Xenia automatic carburettor, in which the extra air inlet was rendered exceedingly sensitive by means of a valve, one end of which floated in a bath of glycerine and mercury, its expanding metal clutch, and the attention

Mr. Percy Richardson on the remodelled 1902 Daimler.

which had been devoted in the selection of materials. The exhibit of Messrs. J. E. Hutton and Co. at the Agricultural Hall Show in the spring attracted notice by reason of the display of the parts for a five-cylinder racer and the chassis of the new 20-h.p. Hutton car, which in many respects differed from the then standard type of car. Especially was this so as regards the radiator and hydraulic change-speed gear, which were built in accordance with Barber's patents; but so far as we can learn none of the cars were put on the road. The Siddeley Autocar Company put on the market 12-h.p. and 18-h.p. chain-driven cars, built for them by the Wolseley Company, into which the concern was afterwards merged. The vertical engines had the inlets arranged in the cylinder heads, and aluminium water jackets.

One of the most novel cars of the year was the Lea and Francis, the three-cylinder engine of which had piston or connecting rods of a length of no less than 28 in. The Daimler Company's new models were of 18-22-h.p. and 28-36-h.p., in which the engine was supported directly on the main frame. The Wolseley Company introduced their sturdy little 6-h.p. two-seater, on which we made a memorable run from London to Edinburgh in February 1904. The same Company's 90-h.p. racer with horizontal engines, built for the Gordon Bennett race in Ireland, was a noteworthy vehicle of the year. The Star Company introduced their popular Star 7-h.p. double-cylinder car, and later in the year a 10-h.p. four-cylinder vehicle on Mercedes lines; Messrs. Rose Brothers produced the 15-17-h.p. three-cylinder live-axle National; the Argyll Company adopted the Hele-Shaw disc clutch; while from Ireland came the 7-h.p. double-cylinder Chambers car.

Messrs. Dennis Bros. made a noteworthy departure by bringing out a 20-h.p. vehicle, in which a worm drive replaced the bevel gear, and which has since been successfully applied by them to motor-buses and commercial vehicles. The Lanchester Company produced their first water-cooled motor, and also a car with artillery wheels. The Standard Motor Company, Ltd., introduced a 12-15-h.p. double-cylinder car, notable for the short stroke of the engine—3 in.—in relation to the bore, which was 5 in. Ryde Motors, Ltd., built a car on the lines of the Wolseley, and later one with a 14-h.p. three-cylinder vertical engine. One of the most curious small vehicles of the year was the Utile Simplex, which had only two speeds, the low gear being obtained by swinging the male portion of the clutch and the cardan shaft into engagement with a disc on the half time shaft of the motor.

Towards the end of the year the Rover 6-h.p. car, built to the designs of Mr. E. W. Lewis, made its appearance. The vehicle was on exceedingly novel lines, no frame in the usual sense of the term being employed, the engine base chamber, gear-box, and cardan shaft being coupled up in one long aluminium case. From Frome came the 6-h.p., 8-h.p., 9-h.p., and 12-h.p. Achilles cars, built by Messrs. R. Thompson and Co.; while Messrs. Brown Bros. introduced several new models of the Brown machines. A demonstration was given by Messrs. J. E. Hutton and Co. of an engine running on solid fuel—naphthalene—by a method devised by two French engineers.

In the heavy petrol vehicle section new-comers were the Orion, the Empire Hagen, with its exceedingly novel system of transmission by variable throw cranks to a ratchet arrangement on the rear axle, the Thornycroft, the Belgian Gobron-Brillié, and the Beaufort. A new pleasure steam car—the Cremorne—was brought out by the Cremorne Motor Manufacturing Company, late the Creek Street Engineering Company, while new names in the heavy steam wagon world included the Bristol Steam Wagon Company and the Glasgow Motor Lorry Company.

From Belgium came the 5-h.p. Minervette and the new Minerva cars, ranging from 8-h.p. single-cylinder to 14-h.p. four-cylinder; a 24-30-h.p. Locomotrice, built under licence from the Rochet-Schneider Company; the "Direct" car, in which the engine was connected direct to the rear axle without the intermediary of any change-speed gear; while finally it may be mentioned that the Germain Company adopted steel cylinders with copper water jackets, their cars being also provided with two forms of high tension ignition—magneto and coil and accumulators.

## 1905.

### ITALY A NEW COMPETITOR.

The year 1905 saw very little change in the general design of cars as compared with 1904. Wheel-bases became if anything longer, and the side-entrance covered bodies more luxurious and largely used than ever. The pressed steel frame was the standard, at least on large cars. The mechanically-operated inlet valve was universal, except, perhaps, on single-

Mr. C. Cordingley on his 40-h.p. Mercedes, 1902.

cylinder engines. Radiators were divided between the framed rubber tube type and the honeycomb, the latter being slightly in the lead. Magneto ignition, especially the high-tension type, was rapidly superseding accumulators and coils, although there was now a tendency to fit this as a reserve. Metal-to-metal clutches made further progress, albeit the leather-faced cone type was still in the majority. Ball bearings were found on 75 per cent. of cars, and direct drive on top speed on 72

per cent. at the last Paris Salon, where it was shown that the cardan shaft had made a further advance over the chain-driven vehicle. The progress of the former was, however, apparently being arrested, a few concerns, notably the Brasier, returning to the older form. On the other hand, Messrs. Rochet-Schneider, who had only built chain-driven cars for some years, brought out an 18-h.p. with a live axle. Wheel control became the standard

The White Steam Car which took part in the 1903 Reliability Trials.

arrangement, while the provision of ball bearings on the shafts of the gear-box, as well as on the axles, was general, a remark which applies to the "gate" control for the change-speed lever. Anti-shock devices were adopted by a number of concerns in connection with the springs, several new forms being introduced. Considerable attention was devoted to the question of engine lubrication, many practical arrangements being brought out with the object of preventing over-lubrication and the consequent annoying emission of smoke; a feature of interest, too, was the appearance of a number of arrangements by means of which the engine could be started from the seat.

The British motor-car industry continued to receive some notable additions. Early in the year the 20-h.p. Brotherhood chain-driven car, built to the designs of Mr. Percy Richardson, made its first appearance, its main feature being the adoption of automatically-controlled synchronised ignition, and a sideways-moving pedal, by means of which the speed of the engine is controlled through a variable lift to the inlet valves. The clutch pedal was also connected up to the brake, so that the car was entirely controlled, apart from the change-speed lever and the emergency hand-brake, by two pedals, the steering column being quite free of levers. Messrs. Legros and Knowles also introduced a high-class chain-driven car to which they gave the name "Iris," which they later superseded by a live-axle car, made in two sizes, 25-30-h.p. and 35-40-h.p. A special form of universal joint was employed, as also a greatly improved type of rear live axle. Towards the end of the year the Daimler Company brought out three new models, 28-36-h.p., 30-40-h.p., and 35-45-h.p., these being the 1906 type, and in which standardisation had been developed to a high degree. The Napier Company adopted a metal-to-metal clutch, and paid great attention to the 30-h.p. six-cylinder vehicle, in addition to three types of four-cylinder cars. The Albion Company produced their first four-cylinder vehicle, a 24-h.p., in which the mixture, ignition and speed of the engine are automatically controlled; the Wolseley Company supplemented their 18-h.p., 25-h.p., and 32-h.p. chain-driven vehicles by 12-h.p. and 15-h.p. live-axle cars, all having vertical engines; the new Arrol-Johnston Car Company, formerly the Mo-Car Syndicate, entirely remodelled its vehicle, and proved the winner of the first Tourist Trophy race; the Standard Motor Company turned out a six-cylinder car, and

the Lanchester Engine Company, who had for years confined their attention to horizontal engines, brought out a vehicle fitted with a 20-h.p. four-cylinder vertical motor. Prominent new additions to the list of British cars were also found in the Rolls-Royce, Adams-Hewitt, Scout, Climax, Globe, Calthorpe, Lindsay, New Leader, Crawshaw-Williams, and the New Engine Company.

The rapid adoption of petrol motor-buses in London added considerably to the number of firms engaged in their construction, which was taken up at home by Messrs. Dennis Brothers, the Lancashire Steam Motor Company, Messrs. Straker-Squire, Messrs. Durham-Churchill and Co., Messrs. Thornycroft, the Wolseley and Ryknield Companies, the Critchley-Norris Motor Company, the Thames Engineering Works, and others, the majority of these concerns also building petrol vans and lorries. A large number of steam vehicles were produced by Messrs. Clarkson, Ltd., a rival having since appeared with the Darracq-Serpellet. The White steam car was of 15-h.p., a new 18-h.p. model making its appearance at the end of the year. Further improvements were made in the Turner-Miesse, while in France two new steam cars made their appearance, the Autovapeur and the Weyher-Richmond. Several additions were also made to the list of steam wagons, notably the St. Pancras, Thames, Hay, Morton and Garrett.

In France considerable progress was again recorded, new cars of note including the Cornilleau St. Beuve, which is being introduced into this country by Messrs. Straker-Squire, the Pilain, de la Buire, and the Sizaire-Naudin, the latter being a novel two-seated vehicle, of which a full description was given in the *M.C.J.* at the time. The Panhard Company built a six-cylinder car, but little or nothing has been heard of this since, and a new light De Dietrich car, with a 12-h.p. four-cylinder engine, was brought out by the Luneville concern. The year 1905 was also noted for the Italian invasion, the well-known Fiat and Itala vehicles being supplemented by the Florentia, Bianchi, Züst, Rapid, Isotta-Fraschini, &c. Belgium's quota to the list of new cars in 1905 was the Metallurgique, which has earned an excellent reputation as a touring car, and the Germain Chainless, already a popular vehicle.

The most powerful car ever built was produced by the Darracq Company for the 1906 Florida Beach races. It was

A Modern Steam 'Bus—The Dennis.

an eight-cylinder vehicle of 200-h.p., and, driven by Hemery over a level road in France, it established a new world's record of 20.35 sec. for the flying kilometre, equal to 109 miles per hour, on the last day of the year. The vehicle now belongs to Mr. A. Lee Guinness, who at Dourdan on Sunday last drove it over the flying kilometre in 20 sec., the new world's record, being equal to the marvellous speed of 112 miles per hour.

## THE DEVELOPMENT OF THE MOTOR-CAR MOVEMENT, 1896-1906.

**I**LLLEGALITIES on the road were the predecessors of the Motor Car Act of 1896. They really commenced in November, 1894, when Mr. Henry Hewetson drove a Benz car, to the amusement of the drivers of horse vehicles and the delight of journalists searching for copy, followed rapidly by the Hon. Evelyn Ellis, a Panhard car, introducing in the summer of 1895, and Mr. J. A. Koosens, of Southsea, a Lutzmann car in the autumn. Between these importations Mr. J. H. Knight, of Farnham, whose interesting reminiscences of the steam car appear on another page, had made a petrol vehicle with which he toured the roads in his vicinity. In Northern Britain Mr. T. R. B. Elliot, of Kelso, was a pioneer, receiving the first motor-car, a Daimler, used in Scotland in the last month of the year, while the Exhibitions organised by Messrs. Cordingley and Co. in these early years at the Agricultural Hall were also factors in the introduction of the automobile.

Early in 1895 Mr. Shaw Lefevre, since elevated to the peerage, who was President of the Local Government Board, introduced a Bill into Parliament to wipe out "the man with the red flag," and so make possible the progress of the motor-car on ordinary

time of his death in January, 1901. The Association secured the help of public men like Sir Frederick Bramwell and Sir Albert Rollit, carriage builders including Mr. John Philipson and Mr. C. J. Jacobs, the President of the British Carriage Manufacturers, as well as several engineers and experts, of whom the names of Professor Vernon Boys and Mr. H. D. Marshall, Gainsborough, now occur to us. For some weeks the society vigorously urged the new Government to take up the proposals of Mr. Shaw Lefevre, with such success that the Bill developed into an Act and came into operation on November 14th, 1896, Mr. Henry Chaplin, who had succeeded to the presidency of the Local Government Board, having piloted it through opposition. The passage of this measure of emancipation may be said to have been proclaimed to the people of London by the appearance of Mr. H. J. Lawson in the Lord Mayor's Show at the wheel of a motor vehicle "The Present Times." There was also a run to Brighton, organised by the Motor Car Club, which forms the subject of a separate article.

The next few months were mainly concerned with financial proposals for the establishment of various motor-car works, most of the companies emanating from the Holborn Viaduct, around which the industry centred in those early days ere the migration westward to Long Acre and beyond. Then came an effort to establish an organisation of an independent character to

The First Exhibition of Motor-Cars. It was held at Tunbridge Wells in October, 1895, in connection with the Tunbridge Wells Agricultural Show. The exhibits included a Peugeot vis-a-vis, a Panhard, a De Dion steam tractor, and a motor-tricycle. The illustration depicts Sir David Salomons driving the Peugeot through the crowd.

roads. But a General Election intervened between the introduction of the measure and its realisation, with the result that no amendment of the law was possible. The work of propaganda was, however, continued, Mr. Worby Beaumont's Cantor Lectures on Motor Cars at the Society of Arts greatly preparing the way for legislation, while the efforts of Messrs. J. H. Lawson and F. R. Simms in connection with the Motor Car Club which they had founded were directed towards catching the public eye. This organisation was also responsible for the exhibition of Self-propelled Vehicles at the Imperial Institute in 1896, where the present king, then Prince of Wales, enjoyed the novelty of a ride by motor-car—for the first time.

Sir David Salomons took the next important step in the educational movement by organising a display of motor vehicles in connection with a show in October, 1895, at Tunbridge, an illustrated reminiscence of which we are able to give on this page. Following this was a Press campaign, and then the convening of a meeting at the Cannon Street Hotel, London, when Sir David suggested the formation of the Self-propelled Traffic Association. This idea was heartily taken up, Mr. Andrew Barr being elected hon. secretary. That gentleman rendered good service for the movement in that capacity, and later as auditor of the A.C.G.B.I., which position he held at the

adequately represent the automobile movement before the country, and to play a suggestive part in guiding legislation—for the law of 1896 was naturally limited, as were the speeds and virtues of some of those pioneer vehicles.

And so, voicing the feeling that was growing, Mr. F. R. Simms convened a meeting of motorists in August, 1897, at which he proposed that "the Automobile Club of Great Britain" should be founded—a title following the designations of the similar associations which had been established in France and Belgium two years before. Supporting his views with the promise of financial aid, Mr. Simms was able to convince others of the feasibility of the idea, and matters progressed so well that in November premises had been taken at Whitehall Court, S.W., for this "Society for the Protection, Encouragement and Development of Automobilmism," and the organising committee was emboldened to call a meeting of supporters, for whom was arranged a light luncheon, to be "followed by a demonstration of the most recent types of motor-cars." The gathering took place, when resolutions and speeches were as numerous as the vehicles, the most interesting of the latter being the 12-h.p. four-cylinder Panhard which had won the Paris-Marseilles-Paris race in the previous year.

The names of the original committee deserve chronicle

in this epitome of the history of the official side of the movement during the decade. They were as follows:—

The Earl of Carnarvon.	Sir Arthur Ellis.
Hon. E. H. Ellis.	Major-General England.
Colonel Lee.	Mr. Paris Singer.
Mr. H. S. Holt.	Mr. F. R. Simms.

Mr. C. Harrington Moore, Secretary, *pro tem*.

At the inaugural meeting on December 8th, 1897, Mr. Roger Wallace, Q.C., was elected chairman, Messrs. Ellis and Simms vice-chairmen, Mr. F. H. Butler treasurer, Mr. Harrington Moore hon. sec., and Mr. Claude Johnson secretary. The following motorists and vehicles assembled in Whitehall Court, and then indulged in runs along the Embankment, to the infinite enjoyment of the public:—

STEAM.			
H. A. House ...	...	...	Liquid Fuel Engineering Company's van.
L. Vickers ...	...	...	Serpuliet.
ELECTRIC.			
J. W. Parr ...	...	...	Headland's Electric Storage Company's phaeton.
Walter C. Bersey ...	...	...	Electric cabs (4).
E. Elieson ...	...	...	Electric.
Carl Oppermann ...	...	...	Oppermann.

been tactfully brought about by Mr. Roger Wallace. On December 15th, 1897, the first committee meeting was held, when an Administrative Committee was appointed. In the early days the House Dinners, followed by discussions, were an effective means of arousing interest in the motor-car, both from the constructional and popular side. At the first meeting, in February, 1898, Lord Suffield, K.G., presided, and a general discussion on the utility of the Club was initiated by the Earl of Galloway. Then followed the first paper contributed to the Club, the author being Mr. J. D. R. oots.

Ambition soon fired these pioneers, and after a course of dinners and discussions it was decided to have an Easter Tour on motor-cars. Mr. F. R. Simms urged that the itinerary should provide for not more than a 40 miles' journey each day, and ultimately the following programme was arranged:—

April 7th.—From London to Guildford	...	...	29½ miles.
" 8th.—Guildford to Winchester	...	...	38 "
" 9th.—Winchester to Chichester	...	...	36½ "
" 10th.—Easter Sunday. Chichester to Worthing	...	...	23½ "
" 11th.—Worthing to Tunbridge Wells	...	...	43½ "
" 12th.—Tunbridge Wells to London	...	...	35½ "

The start was from Whitehall at 3 p.m., and crowds assembled to show sympathy with the voyagers. Mr. Roger Wallace and Mr. F. H. Butler led the procession on the latter's 3-h.p. Benz, followed by nine cars and a wagonette, on which

F. Frentzell ...	...

In steady procession the vehicles sallied forth to Battersea Park, and no accident occurred, a fact that elicited grave comment from many Pressmen who thought they were risking their lives on such a venturesome expedition.

Further strength was subsequently given to the organisation by the incorporation of the Self-propelled Traffic Association with the Club, a rapprochement between the two bodies having

rode some faithful chroniclers and Mr. Linley Samborne, of "Punch." Colonel Crompton, Mr. Worby Beaumont, and Mr. A. Ledger accompanied the party on bicycles. Starting at 3 p.m. all the cars reached Guildford by 7.30 p.m.; each succeeding day had its minor incidents, but the tour did much to assure the public that the motor-car was really a practical and tractable machine. In the summer this was further emphasized by the trials of the Royal Agricultural Society at Birmingham. In these a 4-h.p. Daimler took the first prize, while in the heavy section the Lancashire Steam Motor Company was awarded premier distinction for its 3-ton wagon, a Thornycroft vehicle being second. Trials of heavy vehicles also took place at Liverpool under the auspices of the Self-Propelled Traffic Association in that city.

Later in the year the second anniversary of the passing of the Motor Car Act was celebrated by a run to Sheen House, organised by the Motor Car Club, in which eighty-nine vehicles took part. Included in the commemoration were two public dinners, the Motor Car Club meeting at the Metropole and the A.C.G.B.I. foregathering at the Savoy Hotel, London.

From that time onward the progress of Motorism—a term originally used in the *M.C.J.* in 1899, and revived, amidst the eulogies of the newer generation of motorists, by Lord Justice Moulton at the Motor Union's dinner last year—was hastened

by the systematic work of the Club, together with the series of Exhibitions that had been held by Messrs. Cordingley and Co. at the Agricultural Hall—a series that commenced ere the motor-car was legalised—has contributed much to the education of the public and the consequent fostering of the industry in this country. Following the Agricultural Hall Exhibition of 1898 there was a run to Whitton Park, Hounslow, which attracted more attention from the public than any previous gathering. All London seemed to have crowded into the streets about Islington, and, although the cars did not number more than about a dozen, there were some distinctive types, among them being the four-wheeled hansom cab, driven by M. Jeantaud, a Klauss voiturette, a Le Blon car, the Vallee racer, two M.M.C. vehicles, a dogcart, and a four-seated wagonette, a Mors dog car, the London Motor Van and Wagon Company's vehicle, a De Dion quad, and a Werner motor-bicycle. Amid the plaudits of the crowd the strange conglomeration of vehicles pursued its way, and about sixty intrepid motorists dined together after safely encountering the perils of the way.

### 1899.

In 1899 tours were organised at Easter and at Whitsun to the New Forest and to the Leamington district respectively. In the former twenty vehicles took part throughout the whole journey, eleven others joining in for parts of the tour. The Rt. Hon. J. H. A. Macdonald and the Hon. J. Scott Montagu were participants in the event; Mr. S. F. Edge and Mr. C. Jarrott drove Panhards, Mr. E. M. C. Instone was on a Daimler, Mr. C. Cordingley on a M.M.C. Iveagh phaeton, and Mr. R. W. Buttemer had a Benz Ideal. Many were the adventures on the way. Mr. A. W. Armstrong occupied from 6.30 to 11.40 p.m. to go from Brentford to Reading, a distance of about thirty miles, and Mr. C. Jarrott had a collision with a sheep, resulting in his car being overturned. In six days the party travelled 300 miles, and the luggage van was not the least appreciated vehicle in the cavalcade. The Whitsun tour attracted twenty-five cars, but the weather was tearful and did its worst to dampen the spirits of even the hardest voyagers. Throughout the run of 323 miles in five days—longer runs were already being tried—the sun disappeared and the rain was as persistent as possible. Earl Russell was on a Benz Ideal, Mr. J. A. Holder drove an 8-h.p. Daimler, as did also Mr. J. R. Hargreaves, J.P., who has since figured in the Isle of Man races, Mr. Mark Mayhew had a Mors, Mr. Staplee Firth was on the Lifu steam wagonette, Mr. C. Cordingley was faithful to his Iveagh phaeton, Mr. F. R. Simms had a Cannstatt Daimler, and Mr. F. H. Butler made the pace on a Benz dogcart of double the power of his original vehicle. Thus was the movement advancing. Grief and woe were upon the party; the motor-cyclists abandoned their machines, and from the published reports it was evident that the weather's vagaries threatened to leave depressing memories of the trip. But the hotel life in the evening, with the "petrol talk" after dinner, seems to have worked wondrously well in restoring the jaded spirits of the travellers.

Another event of importance in the official story was a meet of the Motor Car Club in May of 1899, when Mr. C. G. Wridgway, who has long been associated with the American motor business, took part in a famous motor-tricycle race with Mr. S. F. Edge on the Crystal Palace track. There were also contests for automobiles over a two-mile course, gold medals being won by the following:—

		Net Time.	
		Min.	sec.
C. Jarrott	Motor-tricycles	5	15 4-5
Southern Motor Car Company	Motor-tricycles	11	58 3-5
G. D. Barnes	Light cars between 4cwt. and 10 cwt.	8	22 3-5
C. Friswell	Cars weighing over 10 cwt.	6	32
Ormiston and Glass	Motor delivery vans	10	5

In June the first trial organised by the Club took place from Richmond, 22 cars competing in a series of hill climbs on Petersham Hill and a 50-mile spin from Southall, 25 miles along the

Oxford road and back again. Trials for electric and for heavy vehicles were also held. The Daimler ascended the hill at a speed of 5.35 miles per hour, and the 50-mile run was remarkable for the consumption of water on the journey. One car had a stoppage of nine minutes to allow the bearings to cool. In the speed trial the only entrant was a Delahaye phaeton, which covered the mile in 2 min. 13 4-5 sec.

This test was followed by the Richmond Show of the A.C.G.B.I., when gold medals were awarded to the Daimler Company, the Steam Wagon and Carriage Company, and the Motor Carriage Supply Company. But the events of the year were the Commercial Efficiency Trials, conducted in conjunction with the Motor Car Exhibition at the Agricultural Hall, and the heavy motor vehicle trials of the Liverpool Self-Propelled Traffic Association. The former, which were organised by the M.C.J., were really the predecessors of the series of reliability trials that subsequently did so much to further the interests of the automobile in this country.

Apart from its show, which was a failure—from the financial as well as the popular point of view—1899 was an important year in the history of the Automobile Club, for, in the autumn, it held the first of its educational demonstrations before the authorities, whom it sought to convert to a reasonable view of the motor-car and the regulations by which its progress

The Automobile Club's Run to Guildford, May, 1899.

on the roads should be governed. At the request of the officials of the Local Government Board it invited several firms interested in heavy vehicles to submit to a series of tests on Petersham Hill. This was well supported, and the experience gained of value to the Local Government Board in the framing of its later Orders with regard to such traffic. Then came another tour, Folkestone being the objective, and a trip being made to Boulogne to witness the finish of the Paris-Boulogne race of that year, in which the Hon. C. S. Rolls was a competitor. The tour was followed by an exhibition at Dover, which was apparently the first of its kind. Trials were held in connection with the show, Major Holden, Professor Vernon Boys, and Mr. Worby Beaumont being among the judges. Mrs. Kennard took part in the event on her Benz car, Mr. Lyons Sampson had a Benz victoria, Mr. Edge and Mr. Napier were on a Panhard body and frame with Napier motor, and Mr. C. Friswell was present with a Peugeot.

There were two great celebrations of the anniversary of the Motor Car Emancipation Act that year, the Motor Car Club having a run to Brighton, and the Automobile Club one to Sheen House, concluding with a dinner at which several public men identified themselves with the movement. The Motor Car Club's run was a great success, and of the 104 vehicles that

passed over Westminster Bridge in the morning, ninety-five arrived at the southern resort during the afternoon. At the evening meeting it was announced that ninety-six motor-car races had been held under the racing rules of the Motor Car Club.

Towards the close of the year the question of altering the Light Locomotives Acts, so far as the tare limit was concerned, agitated the automobile world, several conferences on the subject being held. Further evidence of the increasing favour of the motor-car was seen during the London County Council elections of the year, when Mr. Mark Mayhew, as a candidate for Wandsworth, used a motor-car for the first time. Nowadays no election is complete without its motor-cars for the conveyance of voters.

### 1900.

Thus far the chronicle of the development of the automobile movement has been mainly concerned with the doings of the official organisations in London, the Motor Car Club doing much work of a popular character, the Automobile Club tending towards the education of those in authority in motor-car matters. The year 1900 was notable for the expansion of interest and the formation of many provincial clubs to further the

movement into the English Motor Club, which had notable runs to Cobham and Bedford in August and September respectively. The autumn was enlivened by the tour of the Whitehall Court Club to Monmouth, which gave an impetus to the movement in South Wales.

Although but an incidental in the forward march of the motor-car, the agitation which arose in connection with the freeing of Maidenhead Bridge from tolls was of service in drawing attention to the motor-car as a vehicle for touring, while the successful issue of Mr. Taylor's agitation was a matter of general congratulation. The immediate result was a lowering of the tolls.

Not only was regard paid to the organisation of the social side of the movement, but those engaged in business also began to assert themselves in societies and associations. The Motor Traders' Association was formed in January and the Motor Vehicle Users' Defence Association was started in February. The latter had Mr. R. W. Wallace, Q.C., as chairman, and was intended for the protection of motor-vehicle users against proceedings or actions at law. Then in November the Motor Trades Protection Association was formed.

The Arena at Cordingley's 1899 Show at the Agricultural Hall London.

movement in distant places. In Scotland a club had been formed late in 1899, which was sub-divided into the Eastern and Western Sections in 1901, and has recently again united into one powerful body. That club did splendid service in organising the Glasgow to London Non-Stop Trials of 1902, 1903, and 1904, as well as the Scottish Reliability Trials of last year and this. Organisations of motorists from north to south did much to further the movement throughout the country. The Manchester and Leicestershire clubs became active; the Yorkshire organisation was established in January, and held its first great meeting in the autumn of the year; that at Manchester in February. The Nottingham Club, founded in October, attracted attention unto itself by a famous run in the following month. In May, the Manchester Club made its first run to Knutsford.

In the south the Automobile Club held many social functions which did much to introduce the motor-car into society, the most notable being the garden party at Strawberry Hill by invitation of Baron de Stern, the occasion including a gymkhana, which proved quite an innovation in those days. The Club's Whitsun tour was to the Eastern Counties, and a Christmas run to the West of England was also held. The Motor Car Club was trans-

formed into the English Motor Club, which had notable runs to Cobham and Bedford in August and September respectively. The autumn was enlivened by the tour of the Whitehall Court Club to Monmouth, which gave an impetus to the movement in South Wales.

It was in 1900 that the present King (then Prince of Wales) became a motorist, his first cars being English built, from the Daimler Company, a fact which gave a decided impetus to the national industry. But standing out among the events of 1900 and historic in the annals of automobilism was the 1,000 mile tour of the A.C.G.B.I. in April and May. It demonstrated throughout the country that the motor-car was a practical piece of work that could be regulated and controlled, although it gave many of the country dwellers an impression that it was as thirsty as any horse. For the trial, eighty-three vehicles were entered; sixty-five started, and twenty-three were officially recorded as finishing. There were monarchs of motors in those days. Lt.-Col. Mark Mayhew, then a member of the L.C.C., rode forward on an 8-h.p. Panhard; the Hon. J. Scott Montagu was 4-h.p. better, he driving a 12-h.p. Daimler; while the Napier was the highest-powered car in the whole entry list. Mr. Frank Butler was not then so much in the clouds as he now is, and struggled gamely with his 6-h.p. Panhard. Powers have increased since then, and reliability too. But motoring is now monotonous and tame compared with the joyous uncertainty that was experienced

on the 1,000-mile trial, or, to be exact, the 1,020 miles that were run.

The start was made from London on April 23rd, after the cars had been exhibited in the arena of the Agricultural Hall Show, and the route lay through Bristol, Birmingham, Manchester, Kendal, Carlisle, Edinburgh, Newcastle, Leeds, Sheffield, and Nottingham, at all of which places exhibitions were held. Most of the failures were officially declared by the judges to be due not to the failure of motor or transmission gear, but to structural weaknesses in other parts of the carriage, pneumatic tyres being especially responsible for delays. For the purpose of the awards the vehicles were divided into two sections, one for makers and two for private owners. In the first category the Benz Ideal, Wolseley, Daimler cars, and Ariel quadricycles took first prizes; second honours going to the Locomobile, New Orleans, Motor Car Company, De Dion, Motor Manufacturing Company, Ariel Tricycle, and Century Tandem.

In the private owners' section the gold medal for the most meritorious car was awarded to the 12-h.p. Panhard driven by the Hon. C. S. Rolls; and silver medals were granted to the following:—Mrs. Bazalgette's Benz Ideal, Messrs. R. E. Phillips (Mors), F. H. Butler (6-h.p. Panhard), T. B. Browne (6-h.p. Panhard), E. Pitman (6-h.p. Daimler), C. K. Gregson (6-h.p. Daimler), J. D. Siddeley (6-h.p. Daimler), the club secretary (6-h.p. Daimler), J. A. Holder (12-h.p.

the municipal domain. The Liverpool Corporation had seven of the Lancashire Motor Company's vans; six of these were in constant use for the removal of house refuse, each van being provided with a trailer. The Bromley Corporation had one of Messrs. Coulthard's vans. It was originally purchased to carry ashes to the Corporation's bacteria beds, but owing to its having to cross a bridge about whose stability some doubts were entertained, it had to be taken off this work, and its operations were confined to the borough for general cartage. The Blackburn Corporation had one of the Lancashire Motor Company's vans, used to carry clinkers to the sewage farm. Worthy to be mentioned in the same connection was a Milnes lorry, owned by the Bradford Corporation. It was used in the tramway department as a tower van, to attend to the overhead electric wires, and it was regarded as successful in working. Being a petrol-driven van, it did not consume fuel when standing in the street to allow the wires to be repaired. The Newcastle Corporation were also using a similar tower van for a similar purpose.

Among the remaining features of the year must be recorded the paper which the Right Hon. Sir J. H. Macdonald, K.C.B., read at a meeting of the Automobile Club, held at the Agricultural Hall, on "War and Power Traction," when he recounted what had been done in connection with Army motor transport, and presaged a fuller development in the future, thus anticipating the Army Motor Reserve of to-day—a force which we owe to

Cars containing the Judges and Officials of the Liverpool Association's Trials of Heavy Vehicles, at Warrington, 1900.

Daimler), and E. M. Iliffe (Enfield quadricycle). International interest was evidenced by the award of three medals given by the Automobile Club de France to the following:—Mr. E. Kennard's 8-h.p. Napier, the Wolseley voiturette, and the New Orleans voiturette.

With regard to the use of motor vehicles in municipal work, the first really comprehensive investigation was made by Mr. T. W. E. Higgins, the Borough Surveyor of Chelsea, who, in 1900, presented a report to his Council on the outlook, in which he suggested that they should regard the matter from all sides, or, rather, as he put it, "look at the horse at both ends," for the horses of the sanitary authority were responsible for depositing three-quarters of a ton of manure per day in the borough. This was a consideration almost new to the public, who had become so accustomed to the equine in the streets that they regard its inconvenience with indifference. Mr. Higgins was one of the first to emphasize this important sanitary consideration in favour of the motor-car.

So early as 1900 municipal authorities were hoping great things from the adoption of mechanical traction. The City of London and the City of Westminster were pioneers in this matter, the former utilising a steam vehicle to carry street refuse to the wharves, and the latter having a motor watering cart in addition. Outside London the heavy motor was also making headway in

the energy and persistency of Lieut.-Col. Mark Mayhew, whose services to automobilism, both on its heavy and its pleasure side, have been great indeed.

Emancipation Day in 1900 was celebrated by a run to Southsea, organised by the Automobile Club, which brought forward 149 entries, 103 of which actually started. All but seventeen arrived safely at their destination, and thirty drivers claimed non-stop diplomas.

Despite such demonstration of advancing reliability, the public in many quarters was being aroused against motorists, and County Councils began to discuss the speed of cars and the behaviour of motorists, with the result that the Automobile Club decided to hold a great meet of motorists in the following spring to convince those responsible for the control of the roads of the safety of the motor-car and the undesirability of the restrictive legislation that was being proposed. Doubtless some of the growing hostility arose from the development of public motor-services, which threatened to reduce the profits of those running horse-driven vehicles. In fact, the Lincoln Tramway Company soon found their revenue decline after the formation of the Lincoln Motor Bus and Parcels Delivery Company, Ltd. Licences were granted in February for public motor-cars to ply for hire in Hastings; those at Eastbourne were renewed despite local opposition.

## 1901.

The indication of restiveness on the part of the public with regard to motorists, to which reference was made in closing the review of 1900, increased in the following year, and the Brighton road became the scene of the police traps with which we have since become sadly familiar. To combat these operations a system of motor patrols was established by some enthusiastic motorists using the road, and the subsequent service of the well-organised Automobile Association thus anticipated. Despite the public protestations of the official motor-car organisation, judicial animosity continued, and at Reigate on one day no fewer than sixty convictions for furious driving were recorded. Then followed a general agitation for the abolition of the speed limit, which did not lessen in volume until in November the County Councils Association adopted a resolution to the effect that the general law of the land as regards vehicles was sufficient for motor-cars provided number-plates were carried and drivers were licensed. It was noted with satisfaction by the more reasonable opponents of the new movement that the Automobile Club did all it could to discountenance furious driving on the part of its members, and issued a circular calling on them to abstain from exceeding the speed limit.

So marked, however, was the hostility to motor-cars that the Motor Union was formed to protect the interests of motorists,

The 1,000-Miles Trial, 1900.—Some of the cars leaving Lincoln. At the wheels of the first three cars are respectively Mr. Frank H. Butler, Mr. J. D. Siddely, and Mr. E. Estcourt.

and it has developed its organisation until now it has affiliated to it all the leading clubs, representative of thousands of motorists. Really it has proved a successor to the Motor Vehicles Users' Defence Association. Its work has been most useful in securing something like a modicum of justice to motorists, who, but for its good services, might have fared badly at the hands of "justice." Meanwhile the Automobile Club was conspicuous in its efforts to educate the public and its demonstrations to county councillors were a useful feature of the year's work, comprising gatherings at Warwick in January, in Suffolk in February, at Worcester in March, at London and Leicester in June, and a run to Southsea on the Emancipation Day anniversary. In addition, there was a great day for chief constables, when they were introduced to the motor-car as a reliable machine, and not the murderous weapon it was represented to be in many quarters. Various runs were also indulged in; those of the English Motor Club served to familiarise the public with the vehicles under control, while the improvement in the speed of cars was amply shown at the Dashwood Hill contests. That all this educational activity was not without effect was seen when in the middle of the year the London County Council refused to endorse a resolution of the Berkshire County Council in favour of the numbering of motor-cars.

Fortunately the motorists in the counties were fully alive to the exigencies of the situation. The Irish Club was formed, and the central authority became the A.C.G.B.I., while the scheme of affiliation to the latter body began in force, the Manchester Club being among the early adherents.

Municipal encouragement continued; the Southampton Borough Council adopted a resolution in favour of a municipal motor-car service; many councils, including that of Beckenham (Kent) and Kensington, adopted motor dust vans; the L.C.C. purchased a steam car for the fire brigade; the Eccles Town Council ordered a motor fire-engine; several motor-bus services were established, and advance was reported on every hand.

Even the British Association became friendly and appointed a committee to investigate the resistance of roads to motor traction, while the Local Government Board was approached by the motor manufacturers, who deplored the public hostility, and hoped it would not warp official judgment, and also by the Liverpool Self-Propelled Traffic Association on the subject of an increased tare limit for heavy motor-vehicles.

Reference has already been made to the interest that was being aroused with regard to motor-vehicles and military matters. This was well developed in 1901 by the reading of several papers on the subject before the Army authorities as well as before the leading automobile organisations. Notable among these was one by Major (now Colonel) Holden on the automobile and its possible uses in war, at the Royal Artillery Institution. Then came the offer of prizes by the War Office for self-propelled lorries for use in military operations, and of tractors for transport services, and the practical assistance of members of the Automobile Club with their cars at cavalry manoeuvres on Salisbury Plain and at cyclist manoeuvres at Aldershot.

The big event of the year was the Glasgow Reliability Trials, which were run over a 530 miles course. The cars took radial journeys daily from the Scottish city, thus following the plan of the M.C.J.'s Commercial Efficiency Trials of an earlier year. The entries included forty-one cars in the manufacturers' section and eleven in that for private owners, and gold medals were awarded as follows:—5-h.p. Wolseley, the Locomobile, 10-h.p. Wolseley, 16-h.p. Milnes, the M.M. Co.'s 6-h.p. one-ton van.

In this year the Motor Cycling Club was formed; also the Aero Club, some members of which distinguished themselves in December by making their first ascent from the Crystal Palace without professional assistance.

## 1902.

The Automobile Club was prominently to the front in the early part of 1902, and wisely took advantage of the important reply that Mr. Walter Long, then President of the Local Government Board, gave to the representatives of the County Councils Association with regard to the regulation of motor-cars. From his speech it was clear that the President was impressed with the Liverpool trials, and the series of demonstrations which had been held in various parts of the country. The Club followed this up by a letter to the Press, which was signed by the Duke of Sutherland and other responsible men, urging that no restrictive legislation should be placed on motor-cars, and they also urged the withdrawal of the tare of weight on vehicles which was limited to three tons.

Several club meets of great importance were held during the year. A summer gathering was arranged at Bexhill, this being the first seaside motor meet held in this country. Trials also took place at Welbeck, which were of some interest, more especially the brake trials held in January, when some results were published, which were regarded with considerable interest at the time. They showed that the average distances in which cars could be stopped when going at different speeds were as follows, the length of a car being taken as 11 ft. 8 in.:—

- 11 to 14 m.p.h. in 1.4-5 times its own length.
- 15 to 17 m.p.h. in twice its own length.
- 18 to 20 m.p.h. in 2½ times its own length.
- 20 to 24 m.p.h. in 3½ times its own length.

In April a non-stop run from Glasgow to London, with a

compulsory halt at Leeds, was organised by the Scottish Automobile Club, and attracted eight starters, only three of whom came successfully through the ordeal, viz., Mr. J. W. Stocks' 8-h.p. De Dion, Mr. G. Iden's 8-h.p. M.M.C. wagonette, and Mr. S. F. Edge's 16-h.p. Napier.

Later in the year the A.C.G.B.I. Reliability Trials took place, daily runs being made from the Crystal Palace to Eastbourne, Folkestone, Worthing and Brighton, and other towns, which did much to reveal to motorists the importance of dealing with the dust problem if their movement was to become really universal; and later in the year a series of dust-laying experiments were made at Farnham with oil as the ameliorative agent. The Reliability Trials did much to popularise motoring, and proved that motor-cars had obtained a position of security and certainty. Gold medals were obtained by a 3-h.p. Humber motor-cycle, a 5½-h.p. Locomobile, an 8-h.p. M.M.C. car, a 10-h.p. Wolseley, a 10-h.p. Peugeot, 15-h.p. Panhard, 20-h.p. Wolseley, and the 20-h.p. Pascal car, driven by Baron Henri de Rothschild. The judges also awarded a silver medal to the 6-h.p. White steam car for its novel features and general excellence. The other great event in the club annals of 1902 was the anniversary run to Oxford in November, when 193 cars made the journey, an innovation in the arrangements being made by the naming, instead of numbering, of each vehicle taking part in the run. The Easter tour of the year was held at Cromer.

The Motor Union, which had absorbed the Motor Van and Wagon Users' Defence Association, was already doing good work, and gave hopes of development into the influential organisation that it has since become.

As usual, the Exhibition at the Agricultural Hall was an event of great importance to the industry, the more so as it was in 1902 that the Exhibition was visited by the Prince of Wales, whose long stay at Islington afforded evidence of the interest which the Royal Family was taking in automobile development. It was this year that the King, when visiting the late Lord Montagu of Beaulieu, made his famous long motor-car expeditions in the New Forest. Earl Roberts, too, on behalf of the War Office, paid the motor-car a singular compliment by inviting owners of such vehicles to join him at Folkestone to take part in some manoeuvres then in progress, and the readiness with which the vehicles met the requirements of the situation convinced him of the value of the automobile as a branch of the military service, and also to his subsequent encouragement of the Motor Volunteer Corps. Equally noteworthy in their way were the Royal Institution lectures on motor-cars by Professor Hele-Shaw. The visit of the Colonial Premiers to this country was also taken advantage of to introduce them to the motor-car, and at the invitation of Sir Wilfrid Blunt they motored to Crabtree Park, in Sussex, an initial trip to many who have since become ardent motorists themselves.

The Premier, Mr. A. J. Balfour, whose yearly visits to the Agricultural Hall Exhibitions had been a factor in his automobile education, had in the previous year written an important letter, pointing out the place that the motor-car might occupy in relieving the congestion in our large towns, and in the summer of 1902 he further showed his interest in the movement by attending the hill climb of the Club on Dashwood Hill, which played its part in the trials of those days.

Already there were premonitions of the change in methods of locomotion that was coming about in our great cities. Motor-buses were again approved by the authorities at Eastbourne in time for the summer season, and an experimental service was projected at Birmingham. Then the London Road Car Company decided to invite assistance in making experiments with motor-buses, and the London General Omnibus Company testified to its watchfulness in the matter by announcing its intention to place an electric bus on the roads.

From many points of view one of the most important events of the year occurred on the Continent, where Mr. S. F. Edge was successful in obtaining the Gordon Bennett Cup for England—an event that not only attracted renewed attention to the progress that was being made by the British industry, but which, for a while, puzzled those responsible for the invitation for the

following year's race as to where, within the British Isles, they would be able to elude the speed limit of twelve miles an hour without incurring police anger and magisterial frowns. The solution of the problem appears in our record of 1903.

## 1903.

Royalty, which, as will be seen from the preceding sections of this record, had early shown an interest in automobile matters, set the sign-manual of approval on the movement in 1903, when the King gave his patronage to the A.C.G.B.I., and the Prince of Wales became patron of the Norfolk Automobile and Launch Club. Further evidence of the fashionable position occupied by the motor-car was seen in the efforts of the parent club to found a Ladies' Automobile Club, in which work Lady Montagu took an active part. More than that, the Motor Car Exhibition at the Agricultural Hall provided further testimony on this point, the visitors on one day including the Princess Henry of Pless, the Countess of Dudley, the Lord Chief Justice, the Duke of Sutherland, the Marquis of Londonderry, the Duke of Buccleuch, Lord Chesterfield, and other well-known noblemen. Then, too, there arose quite a keen controversy with regard to the propriety of going by automobile to the hunting field; that, however, settled itself, the convenience of the auto-

His Majesty the King's First Car, a 6-h.p. Daimler supplied in June, 1900.

mobile being fully recognised, and its presence welcomed rather than tabooed. The formation of the Ladies' Automobile Club at the Hans Crescent Hotel, and their later migration to Claridge's Hotel, Brook Street, W., was clear proof of the advance of the car in Society circles. Throughout the year much was heard of the impending legislation with regard to motor-cars. The Hon. J. Scott Montagu promised to introduce a Bill to abolish the speed limit, secure the identification of cars, and the licensing of drivers. This formed the subject of much debate. Then the Legislative Committee of the A.C.G.B.I. took up the matter, making certain proposals which were hotly contested by Earl Russell. In the end a vote of the members of the various affiliated clubs was taken, which showed 1,015 votes to 463 in favour of the identification of cars by numbers or names if the tare weight was raised and the speed limit was abolished. There was also a majority of 687 in favour of the Club promoting legislation. Later, the Government's own measure was introduced in the House of Lords. It eventually emerged from the Commons as the Motor Car Act of 1903. Its leading exactions have become so well known that recapitulation is unnecessary—many motorists have had practical lessons in the police courts. But it introduced the numbering of cars, brought about the licensing of drivers, and raised the speed limit to twenty miles per hour. A Departmental Committee on Highways was appointed by the Local Government Board, before which Mr. Rees Jeffreys gave evidence, advocating the creation of a central

authority to deal with the roads of the country. The fact that Mr. S. F. Edge secured the Gordon Bennett Cup for this country entailed upon the A.C.G.B.I. the responsibility of selecting a course in 1903. Fortunately such a track was discovered in Ireland, and the Hon. J. Scott Montagu was able to pilot the necessary Bill through Parliament without much difficulty. Ireland was also fortunate in the new regulations issued by its own Local Government Board, which fixed the maximum speed at fourteen miles an hour as compared with twelve miles on this side, and showed a more tolerant attitude than was generally evinced in Great Britain.

The contest for the Gordon Bennett Cup in Ireland quickly resolved itself into a great touring expedition, and became known in the automobile calendar as the Irish Fortnight. The preliminary trials in connection with the main event took place at Clipstone, by permission of the Duke of Portland, who has always shown an interest in motor-cars, lending his private grounds for the purpose of speed trials, &c. There were four contestants for the honour of being in the British team, which was ultimately composed of Messrs. S. F. Edge, C. Jarrott, and J. W. Stocks, all of whom drove Napiers. Unfortunately Mr. Edge was only able to obtain fifth place in the great race, which was won by M. Jenatzy, on a Mercedes, at a speed which averaged 49½ miles per hour. Following the Gordon Bennett

Mr. Chas. Hardy, President of the Nottinghamshire Automobile Club, on his 6-h.p. Delahaye car.

[From a Photo taken in 1901.]

race were a series of speed trials in Phoenix Park, Dublin, a hill-climbing contest at Castlewellan, co. Down, speed runs at Cork, and a general tour to Killarney, the size of the party gradually tapering until only a very few devoted spirits were found at the Irish Lakes. During the tour the Archbishop of Dublin had his first motor ride—on Mr. C. Cordingley's 40-h.p. Mercedes car—a minor incident of the Fortnight, which, however, seemed to set the seal of Irish approval upon the whole proceedings. Club life was again active. The Irish Automobile Club, with Sir Horace Plunkett at its head, early made ready for the great influx of visitors from England; a club was formed in the spring for South Wales, and Oxford University obtained its motor-car organisation. The Wolverhampton Club had its first run in April, and in the same month the Lincolnshire Club invited all the county road surveyors to a discussion—giving them rides by motor-car to and from their homes. Equally enterprising in its way was the Reading Automobile Club, which held five monthly runs for a challenge cup. The Midland Club had an Easter tour to Hereford and the district of the Wye. The Burnley and West Surrey Automobile Clubs were among the organisations formed in 1903. The joint meet of northern clubs

at Buxton brought together an important gathering of motorists, while the speed trials at Southport were another feature of the year's work. Although not under the auspices of any organisation, a motor demonstration at Hertford, by invitation of the mayor, made the automobile known in that county.

In 1903 the reliability trials of the A.C.G.B.I., a series of out-and-home journeys from the Crystal Palace, served the purpose of educating the public and testing the cars. There were 104 starters on the first day, and the number steadily shrunk to 75 on the last day, when 74 returned to the Palace in the scheduled time. On the first day 37 cars made non-stop runs, and 54 on the last trip. The successes of the British cars were really notable, for the following were the only vehicles that made non-stop journeys on all the eight days, viz., the 8-h.p. M.M.C., the 10-h.p. Argyll, the 12-h.p. Wolseley, and the 22-h.p. Daimler. Seven other cars made seven non-stop runs, and lost less than five marks on one unfortunate occasion, viz., the 10-h.p. Lanchester, 10-h.p. Renault, 10-h.p. White steam car—of which vehicle, thus early successful on its introduction to this country, we are able to give an illustration by the courtesy of Mr. Frederic Coleman—and the 10-h.p. Gardner-Serpollet.

Included in the tests was a hill climb up Westerham, when the speed of the twenty fastest cars was as follows, an interesting record, showing what were regarded as good times uphill only three years ago:—

H.P.	Make.	Speed.
		M.P.H.
22 ...	Daimler ...	14.95
24 ...	Wolseley ...	14.85
20 ...	Motor Manufacturing ...	13.91
14 ...	Martini ...	13.50
12 ...	New Orleans ...	12.43
12 ...	De Dion Bouton ...	12.41
16 ...	Rochet-Schneider ...	11.66
14 ...	Renault ...	11.62
16 ...	Dennis ...	11.46
10 ...	Gardner-Serpollet ...	11.07
15 ...	New Orleans ...	10.96
16 ...	Fiat ...	10.70
24 ...	De Dietrich ...	10.47
20 ...	Germain ...	10.44
10 ...	Georges Richard ...	10.02
16 ...	De Dietrich ...	9.99
15 ...	Pipe ...	9.79
10 ...	Wolseley ...	9.73
12 ...	Star ...	9.66
12 ...	Gladiator ...	9.49

At the conclusion, gold medals were awarded to the 5-h.p. Century tandem, the 5-h.p. Oldsmobile, 8-h.p. M.M.C., 10-h.p. Gladiator, 12-h.p. New Orleans, 10-h.p. Gardner-Serpollet, 10-h.p. Rochet-Schneider, 22-h.p. Daimler, while an extra medal was given to the 10-h.p. White steam car for small water consumption. The Glasgow to London reliability run of this year brought out 29 entries, and the following made the journey without stopping, save at the recognised halt at Leeds, viz., 10-h.p. Lanchester, 24-h.p. Darracq, 10-12-h.p. four-cylinder Sunbeam, 12-h.p. Arrol-Johnston dogcart, 12-h.p. six-seated Arrol-Johnston dogcart, 10-h.p. Wolseley, and the 12-h.p. Argyll.

## 1904.

The Motor Car Act of 1903 came into operation on January 1st, 1904, and the new conditions under which motorists then drove upon the roads were naturally the subject of much discussion. As was mentioned in our columns in those troubled days, "for the first time in our history private gentlemen have had their vehicles numbered like auction lots, and they have been at the mercy of local prejudice, police watchfulness, and magisterial bigotry. Those who hoped," we wrote, at the end of the year, "that the new Act would prove a satisfactory solution of the difficulties that had arisen in connection with the advance of the automobile movement have been grievously disappointed, and the many anomalies that have been discovered during the course of the year have shown that the contention of those motorists who were loth to welcome fresh legislation have been amply justified." Police traps became a feature of the roadside, and magisterial antipathy seemed to grow as the

number of their victims increased. The obvious keenness of the police in attempting to obtain convictions led to many grave errors of judgment, and there was a feeling of relief when the Motor Union began to carry appeals to the higher courts. They obtained their first High Court decision in favour of motorists since the passing of the Act in May. The case was that in which Mr. Clifford, jun., of Loughborough, had been granted a *nil nisi*, which he obtained against the Loughborough justices for a *certiorari* to quash a conviction of the applicant by them under Section 1 of the Motor Car Act. The conviction was worded as follows:—"That on a public highway there situate he drove a motor-car at a speed and in a manner which was dangerous to the public, having regard to all the circumstances of the case, including the nature, condition for use of the highway, and to the amount of traffic which actually was at the time or which could reasonably be expected to be on the highway." The summons to appear before the magistrates was worded in the same way, and the rule was obtained on the ground that the conviction was bad for duplicity as charging more than one distinct offence on a single summons. This association of "dangerous speed" and "dangerous manner" really referred to two distinct offences, and the action of the Motor Union was of service to the movement in preventing the Loughborough injustice becoming a precedent for other courts to follow.

When the Act was enforced many things had to be done, including the registration of cars and the licensing of drivers, while local authorities began to consider the provision of road signals and warning notices, in which matter they had been woefully neglectful in the past. In Somersetshire, to mention but one instance, it was discovered that no fewer than 1,200 road signs would be necessary, in the opinion of the local authorities, if the provisions of the new legislation were to be fully complied with. However, many of the local bodies regarded such a state of things with equanimity, for they hoped much in fines from motorists, it being reported that the convictions of Sergeant Jarrett alone had been worth £230 in the previous year—even before the setting of police traps had been raised to a subject of study, though it never reached the realms of "exact sciences." Early in the year a Departmental Committee was appointed, under the chairmanship of Mr. H. Hobhouse, M.P., to advise the Local Government Board with regard to the issue of regulations under the Act. These were issued in March, and did not seriously disturb the order of things. They permitted the width of cars up to 7 ft. 2 in., provided for the fitting of brakes on trailers, on which was to be a person competent to apply the same. Precautions against the starting of cars were insisted upon, and the regulations promulgated with regard to the notices and sign-posts under Section 10 of the Act. Later in the year the heavy motor-car regulations were issued increasing the maximum weight of unladen motor-cars to 5 tons and 6½ tons, in place of the 3 tons and 4 tons mentioned in the Locomotives on Highways Act, 1896, and making other provisions. While all these legislative and administrative Orders were couched in fairly liberal terms, complaints continued through the year as to the spirit in which they were interpreted by those responsible for their operation.

Apart from the new Act, 1904 was a memorable year in regard to trials and races, the Isle of Man first attaining distinction in this respect. It was selected as the scene of the eliminating contest to select the British team for the Gordon Bennett race, and the Manx people readily recognised the commercial value of such a favour. There were eleven entries—five Napiers, three Darracqs, and three Wolseleys—the ultimate selection being Messrs. S. F. Edge (Napier), S. Girling (Wolseley), and C. Jarrott (Wolseley), with Messrs. J. W. Stocks (Napier) and J. R. Hargreaves (Napier), as reserves. Mr. C. Earp (Napier) would have had second place but for an unfortunate accident which occurred at the conclusion of the speed tests which formed a factor in the decision. In these the fastest time was made by Mr. Edge, who did the kilometre in 39 sec. Later in the year, at Blackpool, where a successful meeting, with 120 competitors, was held, Mr. Earp, on an 80-h.p. Napier, travelled over the kilometre course in 26 2-5 sec., tying with the time of

the Hon. C. S. Rolls on his racing Mors at Welbeck. There were several other sporting events during the year, including trials at Bexhill and Portsmouth, and a gymkhana at Hastings, while the Ladies' Club were emboldened to hold a run to the Ranelagh Club at Barnes, the procession of cars starting from Waterloo Place, London, headed by the Duchess of Sutherland on her 18-h.p. Mercedes.

Among the personal incidents of the year mention may be made of Mr. J. T. Overton's ascent of Porlock Hill on his 16-h.p. Georges Richard car—thus emulating a feat first performed by Mr. S. F. Edge on his Napier in 1900. Mr. D. M. Weigel also made a good run on his 20-h.p. Talbot, securing the Dewar Cup for a non-stop run, after travelling more than 2,000 miles. Several end-to-end runs were made by other drivers, and the A.C.G.B.I. was constrained to discourage some of the sporting events which added to the gaiety of the motoring world in those days. It issued a notice discountenancing such, and making regulations for their proper observation and control. Captain Deasy was the first to comply with the new conditions, and ran a 4,000 miles trial on his 16-20-h.p. Martini car, with the Club's sanction, and under the direction of its official observers. Although scarcely coming under the same category, General Booth's motor-car tour may be chronicled as a feat of reliability and a tribute to the value of the motor-car in a department of activity in which it had not previously been recognised.

In addition to these interesting incidents of the year, there were the more serious trials, of which the small car runs held in the neighbourhood of Hereford, with the Frome's and Dinsmore Hill climbs, were the chief. Owing to the initiative of Mr. Wilfrid Groom, the hon. secretary of the Herefordshire Club, this event of the A.C.G.B.I. was removed from the London area, and very remarkable was the tolerant—in fact, helpful—attitude of the county police and other officials. With regard to the trials themselves, they revealed that the reliability of the light car was as pronounced as that of those of higher power. There were thirty-eight entries, and gold medals were awarded to the Wolseley, Siddeley, and Swift cars. Mr. Basil Joy's organisation of the event recalled his successes in the earlier Trials of the Club from the Crystal Palace. The Glasgow to London non-stop run of the Scottish Club was another feature of the year. There were thirty starters; twenty-seven completed the run, and eight secured non-stop diplomas, gold medals being awarded to the 6-h.p. Wolseley, the 10-h.p. Argyll, and the 20-h.p. Thornycroft. The Scottish Club had also been prominent early in the year with an appeal to its members to drive with care and consideration—an appeal which was noted at the time as evidence of the desire of the more responsible motorists not to arouse public opinion against the movement that was spreading so satisfactorily. A motor-cycle trial from London to Edinburgh also attracted notice. There were forty-six starters, twenty-two of whom got to their destination within the twenty-four hours of schedule time.

For the first time a trial was held of the non-skids then on the market, eleven being submitted to a series of runs aggregating 850 miles, and then some interesting manoeuvring over a grease-prepared track in the Locomobile garage at Kensington. The gold medal ultimately went to the L'Empereur device, the second award to the Parsons non-skid, and the third to the Billet non-skid, that of the Wilkinson Company being commended. Later, further dust experiments were made by the A.C.G.B.I. on some of the roads of Surrey.

The heavier types of vehicles were making progress, and towards the end of the year several motor-bus routes were experimentally opened up in London. In the North of England the North-Eastern Railway Company carried out a series of experiments with motor vehicles for the distribution of produce, &c., in the agricultural districts, and at the Royal Agricultural Society's Show at Park Royal there was a larger display of heavy vehicles than had been previously seen at such displays. The War Office, too, conducted a series of experiments with Stirling motor lorries at Edinburgh, and on all hands the progress of this section of the industry was noticeably great.

Although the old-time May Day revels are gone beyond revival, the Motor May Day of the Motor Van and Users' Association—held on April 30th—attracted general notice, and served to emphasize the fact that motor vehicles were in use in all trades. Shortly after a series of delivery van trials was announced, and many corporations and companies appointed their delegates to attend the same. But they were postponed from time to time, and disappointment has, thus far, been the lot of those who hoped such trials would do for the light business vehicle what the earlier tests had done for the pleasure and touring car.

Late in the year England was visited by a party of French motorists, who toured the South of England under the organisation of the Marquis De Dion, while a number of Scotch surveyors paid a visit to France to inspect the main roads there.

### 1905.

Reviewing the course of the automobile movement we may summarise it as a period of rapid progress, and, as was stated in the MOTOR CAR JOURNAL, referring to the motor-bus boom of that year, "the penny-a-time motorist has arrived."

1905 occupied a mid-position with regard to the Motor Car Act, which came into operation at the beginning of 1904, and will pass away by effluxion of time at the end of 1906. The

Dr. Lehwess starting on his tour round the world in 1902.

tendencies it encouraged in the first period of its career were mitigated in a few places, but increased in others. Within the last few months the formation of the Automobile Association, as the outcome of a system of warning cyclists originated by Messrs. Jarrott and Letts, did much to encourage considerate driving, and prove the unprofitableness of official nets for motorists. Since then the Association has well justified its foundation. Local authorities did not wholly cease from troubling, but their antipathy was less apparent, for the refusal of several County Councils to endorse applications for reduced speed limits, and the negative replies of the Local Government Board to nearly all such requests, sobered the most sanguine anti-motoring orators.

So dependent is the advance of automobilism upon questions connected with the road that reference may be made to that important subject as the foundation of success. Many efforts were made during the year to persuade local authorities to provide clear roadways for traffic on surfaces properly constructed to avoid dust. Towards this end the Roads Improvement Association did good work, commencing the year with making representations to the Board of Trade against the erection of tramway poles in the centre of some of the main roads leading north of London. These were officially conveyed to the local authorities interested, and, although not successful in securing the removal of such dangerous obstructions, the Association

continued its educational work so well that the conversion of many members of public bodies to their view seems but a matter of time. Considerable attention was attracted to materials calculated to provide a dustless surface, and notably during the Brighton race meeting it was amply demonstrated that progress had been made in that direction. Several county officials assisted the Automobile Mutual Protection Association in its suggestive experiments with a view of mitigating, if not entirely obliterating, the dust nuisance. The problem of the dust, however, is not to be regarded as wholly associated with the making of the road, Mr. F. F. Wellington's comparative tests with a Spyker car and various horse-drawn vehicles, as well as automobiles, showed that the construction of the car itself is a factor of importance—a fact emphasised at the discussions held at the A.C.G.B.I. during the year.

Early in the spring of the year the Heavy Motor Car Order of the Local Government Board was issued, and the development of the commercial side of the industry has been the dominant note of the twelvemonth. The popularity of the motor-bus was a feature of the streets of the Metropolis, six companies for placing motor-buses on the streets being formed in one month alone. Tradesmen and commercial firms, too, gave more heed to the merits of the automobile than previously displayed.

The event of the year was, of course, the appointment of the Royal Commission on Motor Car Traffic, with Viscount Selby as chairman and Captain Clive Bingham as secretary.

Trials and contests of various kinds maintained the curiosity of the public, and incited makers to the perfection of cars. One or two sporting events like the Siddeley and Meyan match provided mild excitement, and the Eliminating Trial in connection with the selection of the Gordon Bennett team gave zest to the racing season. The eliminating trial for the British team resulted in the selection of Messrs. Clifford Earp (Napier), C. S. Rolls, and C. Bianchi (Wolseley). The presence of an English Daimler team in the Herkomer Trophy race was a tribute to our national advance. Nor must the performance of Mr. A. Macdonald on the Florida beach be overlooked. He covered a mile in 34.45 sec., 5 miles in 3 min. 17 sec., 10 miles in 6 min. 15 sec., and 20 miles in 15 min. 23 sec. Automobile trials were not limited to Europe and America. Several native drivers, as well as gentlemen of English birth, participated in the Delhi-Bombay trials.

Disappointment was general at the postponement of the Light Van Trials, which were to have been a means of furthering the commercial vehicle branch of the industry. Fortunately, the Tourist Trophy race in the Isle of Man attracted a capital entry, victory eventually falling to Mr. J. S. Napier's Arrol Johnston. In the spring the Scottish Reliability Trials afforded an example of organisation well-nigh perfect, as well as presenting difficulties of road and course such as had never been included in the performance of a motor-car test. In the end eight foreign and seven British cars were recorded as having made absolutely non-stop runs on each of the four long and trying days of the trial. Continental entrants gave distinction to the Brighton and Blackpool meets. The gathering at the southern resort was greatly favoured by the leading citizens, whose payment of a considerable sum in the provision of a motor track was later made the subject of an action in the law courts. Bexhill, Filey, and Skegness also had their automobile meets, demonstrating the ability of the drivers as well as the speed of the cars.

In connection with important club matters we may recall the change in the internal organisation of the A.C.G.B.I., which was made early in the year, the triple secretariat being discarded. To the regret of many, Mr. Basil Joy resigned from the Technical Department, and the responsibility for the Trials, where his careful premeditation had always ensured success. As secretary of the Club Mr. J. W. Orde was made responsible for the Trials, Competitions, and social side of the work, in the former being now assisted by an assistant secretary. Mr. W. Rees Jeffreys combined the head of the legal department with the secretaryship of the Motor Union, and rendered splendid service to the whole movement in the latter capacity.

## EARLY MOTOR-CAR EXPERIENCES.

BY JOHN HENRY KNIGHT.

**E**VEN in my boyhood, fired with the stories of the doings of Hancock, Gurney, and others, I was hoping to see steam used on the road, and in 1868 I made a small steam carriage, which weighed about 30 cwt. and carried three passengers and stoker. I ran it at various times for four or five years, but, although I escaped the clutches of the law, I at last gave it up and sold it to a man who had invented a wheel for traction engines and required a small machine with which to try his invention.

Meanwhile the French and Germans were experimenting. In 1892, armed with an introduction from the late Mr. Bryan Donkin, I went to Paris and had a ride with M. Serpollet on one of his steam cars. On leaving I expressed to him my regret that the English laws did not allow such carriages to be used; his reply was, "You English are a clever people but your laws are bad, very bad."

In those days the idea of using any mechanical power on the road for carrying passengers was in England looked upon as absurd. The man in the street could not dissociate a steam car from a traction engine or a small railway locomotive. Very little was known in England of what was being done abroad, and the contest of self-propelled vehicles in 1894 from Paris to Rouen was hardly noticed by the Press of this country. Anyone in England who expressed his opinion that mechanical traction might compete with or supersede horse traction was looked upon as a man whose sanity was in question.

In the following year, 1895, I was again in Paris and had a ride with the late M. Levassor in one of his cars—it was a dog-cart with a  $3\frac{1}{2}$ -h.p. engine. Having been experimenting successfully for some seven or eight years previously with oil engines, I commenced, in January, 1895, the engine for what I then termed a motor-tricycle, but it was very different from the motor-tricycles that were in use a few years ago. The engine was  $3\frac{1}{2}$  in. bore and 6 in. stroke. When the motor was completed,

but before it was placed in the vehicle I subjected it to some months' trial with paraffin oil and with benzoline (petrol not being then on the market) to find a suitable form of vapouriser. By the middle of July it had its first trial on the road. Unfortunately I was detained in Switzerland by a severe accident caused by a horse shying, and it was not till some weeks later that I saw it on the road. The engine drove by two belts on pulleys of different sizes on to an intermediate shaft, which drove the main axle by a chain—one wheel only, that on the left side, being the driver. The belts were slack, and tightened by two jockey pulleys. I tried several methods of firing, and found that a tube heated by a blast lamp gave the best result. The weight originally was a little under 5 cwt., and when running well the machine would do about eight miles per hour on a level road, and three and a half miles up a hill of about 1 in 16. In these days such a pace would be considered miserably slow, but at that time the high speeds of the present day were not dreamed of, the idea being that the vehicles would run about the pace of a horse, but that they would be able to cover greater distances in the day than a horse could. But the contest in the summer of 1895, when the late M. Levassor ran from Paris to Bordeaux and back, a distance of over 700 miles, at nearly fifteen miles an hour, showed the possibility of a far higher speed than can be attained by a horse.

Mr. Shaw Lefevre had introduced into Parliament in the summer of that year a Bill to permit motor carriages to run on our roads, but, the Liberal Government going out in July, the matter was dropped. It is curious that the first ladies to ride on my little car, other than members of my own family, were two sisters of Mr. Shaw Lefevre. I ran the machine for some months in the neighbourhood of Farnham, and a great many people came to see it, but in October I was summoned by the police for using a locomotive without a licence, and for not having a man in front with a red flag. The case was heard at the Farnham Bench on November 1st, when the Surrey County Council sent down a barrister to prosecute, who dwelt on the dangerous character of the machine, as it was driven not by steam but by explosions! The result was that I was fined 2s. 6d. on each summons and expenses, but the prosecution did good, as most of the papers had something to say on the subject of the absurdity of not permitting such machines to be used on the roads. The *Daily Graphic* had a sketch—"The Law and the Locomotive," showing how motor tricycles must be worked, a man sitting in a tricycle with boiler in front, his coachman driving and a page boy walking in front with a red flag. Although I was stopped from running about on the roads, I often had a run in the early mornings to show friends and for experimental purposes. Fortunately I have a private farm road, but with poor surface, about 200 yards from

my house, and by watching to see if police were about a minute's run brought the car to the private road. Here a good deal of experimenting was done, using paraffin, with which the little car seemed to run as well as with benzoline, but it was impossible to prevent a puff of smoke when the governor acted. I feared that, being a three-wheel vehicle, there was a danger of upsetting, as the centre of gravity was high, so in the following spring I put two wheels in front.

Your readers may remember that the old Self-propelled Traffic Association, started by Sir David Salomons, promoted an exhibition of motor vehicles at the Crystal Palace in May, 1896. On the opening day there were four cars running—a Peugeot, a

Panhard, a Benz and my little car. As the latter was the only one of British make, it carried a red ensign in front. Later I put in a  $4\frac{1}{2}$  in. by 6 in. cylinder; this necessitated a heavier flywheel and the strengthening of the carriage. The original wheels, which were of the wire type with rubber tyres, showed signs of giving way and were replaced by wooden ones, so that the weight of the car was increased. With the  $4\frac{1}{2}$  in. cylinder it would run ten miles an hour on fairly level roads, but at this speed it was not very comfortable to ride in, for the springs, spiral ones, had not sufficient elasticity. If I had had ordinary carriage springs it would have been much better.

Those members of the Automobile Club who lunched at my house on Good Friday, 1898, will remember the little car, for I ran a short distance with them on the road to Winchester. In the summer of that year I bought a Benz and my old car was laid aside. The vehicle is still in existence, and as I believe it is the first two-seated internal combustion car made in England, I am anxious that a permanent home may be found for it in some museum. As the South Kensington Museum is the resting-place of four old locomotives, besides a vast number of experimental machines, it is to be hoped that the authorities will find space for some of the motor-cars of early date. If the matter be put off for ten or more years some of these ancient machines may be broken up.

The Author and the Petrol Car he built in 1895.

## TEN YEARS OF MOTOR RACING.\*

BY GEORGES PRADE.

THE sport of automobile racing began in France and the entire world ten years ago, and these ten years are those that created not only the racing car which we saw whizzing by on the Circuit de la Sarthe at ninety miles an hour, but also the touring carriage which brought the visitor to the tribunals of Mars, and which, however humble and modest it be, is nevertheless a monster of speed as compared with the racing car of days gone by.

Let us, then, date the foundation of automobile racing in France from the Paris-Bordeaux race of 1895 (although a few races of no great importance had taken place previously), and allow us to present the first winner, the famous No. 5, which was driven by Levassor himself, the founder of the great French establishment which was found in line again this year. It is a far cry from that crude carriage with its 4-h.p. motor to the monster of to-day. High and short, and so heavy that with so moderate a power it would not even have been able to take part in races in which the weight is limited to 2,200 lb., it took 48 h. 12 min. to make the round trip, a total of 720 miles.

It was also a Panhard that triumphed in 1896 in the Paris-

in line upon a motor-cycle in the first Marseilles-Nice race. The year 1897 was more confused. The Automobile Club of France did not itself organise any great races; but the Automobile Club of Nice got up that of Marseilles-Nice, which was won by Count Chasseloup Loubat on a De Dion-Bouton steam brake, followed by M. Michelin, the well-known manufacturer of pneumatic tyres, who tested his own products, with the result that he became the first to engage in an industry which was then unthought of, and the success of which was to be phenomenal.

Beaten at the beginning of the season, the explosion motor had its revenge in the Paris-Dieppe and Paris-Trouville races with the Leon Bollée voiturettes that were led to victory by Jamin, one of the organisers of the 1906 Circuit of Sarthe, and with the famous 6-h.p. Panhard carriages, which have become classic under the name of Paris-Dieppe, and were led to victory by M. Huillier, at present one of the managers of the Mors establishment and who raced under the pseudonym of Giles Hourgieres.

It was with this same type of carriage, the last to be steered with a lever, that René de Knyff in 1898 was to gain his first victory in the Paris-Bordeaux race, in which he covered the distance in 15 hours, a performance which, at the time,

Messrs. Cecil Edge and A. Macdonald on the Napier Racers they drove in the Eliminating Contest for the British Team in the 1905 Gordon Bennett Race.

Marseilles and return race, organised by the Automobile Club of France, which had then been formed. The test was a 1,054-mile one, and the winner was Mayade, who covered the distance in 67 h. 42 min. 58 sec. This time the run was by stages, and the race lasted ten days. The carriage would appear to-day as ridiculous as that of the Paris-Bordeaux race, with its cow-tail steering lever, which was to cost the life of Levassor in this same race, and, three years later, that of Mayade himself.

Nevertheless, we note an improvement in the first motor with four non-balanced cylinders, in which the explosion passed successively from the first to the second, from the second to the third, and from the third to the fourth, thus making of the motor and carriage a genuine instrument of torment by reason of its vibrations. In the test for motor-cycles, now abandoned, the winner was Viet, upon a De Dion machine. Among the participants in the Paris-Marseilles race with Viet, now engineer at the Renault Brothers' works, was to be found in a carriage with seats for four, and which was to make the first trials of pneumatic tyres, Chevalier René de Knyff, now president of the Racing Committee of the Automobile Club of France. The Marquis De Dion had already taken part in the Paris-Bordeaux race, and in 1897 we saw Baron Zuylen

astonished the whole world. But the year 1898 was to witness the advent of the first car of which the outlines and details slightly recall the motor vehicles of the present day—that famous 8-h.p. Panhard which won the Paris-Amsterdam race and glory for Charron, who covered the 1,011 miles divided into six stages in 33 h. 4 min. 34 sec. The second was M. Girardot, the third Gaudry, the pseudonym of M. Etienne Giraud; the fourth M. René de Knyff, and the fifth M. Loysel. The 8-h.p. Panhard of the Paris-Amsterdam race had four balanced cylinders, a steering column with inclined wheel, and a radiator in front. The form of the car was elongated and low, and the average of the winner, which was 30 miles an hour, marked the definite conquest of what we to-day call speed, for even at the present time an average of 30 miles on an unprepared road constitutes an unquestionable speed.

But something better yet was going to be done. The year 1899 was to mark the creation, by the Panhard establishment, of the famous 12-h.p. cars, the type of which long remained classic, and which, driven by Charron, won the Paris-Bordeaux race in 11 h. 43 min., and then the celebrated 16-h.p. Panhard with which René de Knyff was to win the Tour de France (the longest test known to automobile sport—1,398 miles) in 44 h. 43 min. Toward the end of 1899 the 16-h.p. Mors had

\* Translated from "Les Sports."

already triumphed in the Paris-Ostende, Paris-Trouville and Bordeaux-Biarritz races. However, the decisive contest between the two great French houses did not take place till July, 1900, upon the 822-mile stretch of the Paris-Toulon race, where the 24 h.p. Mors driven by Levegh attained an average speed of 43 miles an hour, and covered the distance in 26 h. 43 min. 55 sec. The winner of the voituresses was the glorious Marcel Renault, who was later on to lose his life in the Paris-Madrid race, after winning the Paris-Vienna event.

The great year of success for the Mors establishment, however, was 1901, in which Henry Fournier, its champion, won in succession the Paris-Bordeaux race at an average of 55 miles in 6 hours, and the Paris-Berlin—which will perhaps remain the most colossal success of automobile tests—in which he covered 732 miles in 16 h. 6 min. Here again the voiturette winner was Renault, represented by the second brother, Louis, who was both an engineer and racer.

The year 1902 marked the first important regulation of automobile racing. It was the weight limit. It was decided that racing cars should not weigh over 2,200 pounds. The general type had been scarcely modified. At the most, a new form of the old Daimler had made its appearance in the Mors

The Paris-Madrid Race.—The cars arriving at Bordeaux, where the Contest was stopped.

and Mercedes, with ignition by magneto, and, later, a steel frame. The year 1902 was that of the great battle. This was waged upon the 873-mile stretch of the Paris-Vienna circuit, the winner in which was Marcel Renault, in a light 1,430-pound carriage, while after a furious contest between Panhard and Mercedes in the big 2,200 pound class, victory settled upon the banners of the French house with its 70-h.p., the champion of which was Henri Farman, who came in ahead of Zborowski, who drove a 40-h.p. Mercedes. The general victory was accorded to Marcel Renault. It was in this race that was seen the advent of the majority of the marks that we find in the lists of to-day: the Darracq, which disputed the victory with the Renault up to the last moment; the Brasier, which was then making its debut; the Gobron-Brillié, run by alcohol; and the Clement.

It was in this race that Edge, in a Napier car, captured the Bennett Cup from France, an event comparatively unnoticed at the time, but which is perhaps the main point of this history of the sport, since for many years, and even up to the present one, it displaced the pole of automobile sport, relegated all the other races to the second rank, and founded the automobile industry in other countries than France by obliging them to make use of their own resources solely.

It was at the end of the season of 1899 that Mr. James Gordon Bennett founded the celebrated race, the principle of which was that it should be disputed between the great national clubs, each represented by three cars manufactured in all their parts in the country represented by the club. It was therefore a national competition *par excellence*, which required a national production in each country.

The first year the cup was contested for upon the Paris-Lyons Circuit, and there was but one rider to each of the three 20-h.p. Panhard cars that contributed the French contingent. The winner was Charron, who came in ahead of Girardot. In 1901 the cup was obscured in the Paris-Bordeaux race won by Fournier; and the winning of the cup by Girardot in a 24-h.p. Panhard car passed unnoticed. Up to then no foreign club existed, or, at least, as in 1901, had come to the front. Again in 1902 the race was run in conjunction with another (Paris-Vienna), when, some racing accidents having arrested the three French champions, Edge, the sole foreign contestant, in a Napier car, captured the cup and carried it to England.

From that time it was the Gordon Bennett Cup that became the great race. The prohibition of races in France after the Paris-Madrid, of which the first stage only was run, and won by Gabriel on a Mors, soon emphasized this evolution. The creation by Baron Pierre de Crawhez of the Circuit of Ardennes, the great Belgian race, inaugurated the principle of the circuit, and of the race without neutralization, but did not suffice to diminish interest in the Gordon Bennett cup. Such interest became colossal when, in 1903, the cup was won in Ireland by Jenatzy on a Mercedes car, and was thus captured for a second time by another than France and carried to Germany.

The type of the victorious racing car was to have a profound effect upon the prevailing style of vehicles. The chassis of pressed steel, ball bearings, the regulation of the gases, the ignition by magneto and the radiator cooled by fan were introduced into fashion by the successes due to the races of 1902 and 1903.

The cup therefore became the object of the test of 1904. The French industry prepared itself thoroughly for it, and the Automobile Club of France organized elimination trials in order that it might designate its three champions. It was the Brasier establishment, new in name, but whose engineer, M. Richard Brasier, had assisted in the construction of the victorious cars of 1900 and 1901, which attached its name to the recapture of the cup in 1904 at the Taunus race, and to the apparently definite possession of it at Auvergne in 1905. It was a Brasier car driven by Thery that won the four races in succession, beating the German industry in the Taunus and the Italian in the Auvergne race after a hot contest. For it must here be remarked that in 1904, at the Taunus race, a new rival, Italy, had sprung up with the Fiat cars, which, in 1905, came very nearly taking the cup from France. At the end of the year 1905 the Italian industry gained its first international victory at home at Brescia with the Italas, while the Darracq cars won in succession in the Circuit of Ardennes and in the Vanderbilt cup race in the United States.

## TECHNICAL EDUCATION.

ONE of the most gratifying developments of the later years of the first decade of the modern motor-car is the encouragement which local educational authorities have given to instruction in automobilism—both theoretical and practical. The first efforts were difficult, owing to the absence of suitable teachers as well as to the prejudice of public representatives loth to accord support to a movement at once novel and revolutionary. But the growth of the industry has forced their hands in many places. The Battersea Polytechnic was the pioneer in this movement and the first to have a motor-car for actual instruction in driving, Mr. H. J. Taylor being the instructor. Since then the Regent Street Polytechnic, the Northampton Institute, and other London institutions have accepted the automobile in their curriculum, while railway companies interested in the provision of education for their workpeople have also arranged for instruction therein, notably the Great Eastern Railway at its institute at Stratford.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### THE TOURIST TROPHY RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As my suggested modifications to the Rules for next year's Tourist Trophy Race have attracted so much criticism, I should like to state that my sole reason for making the suggestion was to prevent, as far as possible, freak cars taking part in the race. The Tourist Trophy Race is supposed to be for "ordinary touring cars," vide Rule 12, therefore it appears to me that one of the first points to be settled, in connection with the rules for next year's race, is the definition of "an ordinary touring car." To my mind "an ordinary touring car" is one in which there is comfortable accommodation for the number of passengers it is supposed to carry, and adequate space for a moderate amount of luggage. If we assume that this or some very similar definition is agreed to, then the following details should be carefully studied and settled, viz.:—1. The number and weight of passengers to be carried. 2. The dimensions and minimum weight of body. 3. The distance from dash to front edge of back tyre. 4. Clearance. 5. Breadth of frame and track. 6. Minimum weight of chassis. 7. Maximum average speed desired. 8. Allowance of petrol.

experience. I will take "Medicus's," questions in rotation. *First*, hilly country. A Turner-Miesse steam car is what he requires; this vehicle will take him up the steepest hills without any rushing at the bottom. In fact, the longer the hill the better the car pulls. It has another great advantage for hilly country: should the brakes by any mischance fail to act in descending a hill, you can always reverse the engine and pull up the car. *Second*, is a steam car (once steam is up) as easy to start as a petrol car? Yes, more so; you simply let back the pedal and the car glides along without noise, vibration or smell. *Third*, Is it more economical? Yes; because the car burns paraffin costing from 5d. to 6d. per gallon, and will run as far as a petrol car carrying the same quantity of petrol, which costs at present 1s. 3d. the gallon. The car runs from eighty to one hundred miles on one fill of water, according to whether country is hilly or flat. *Fourth*, does engine last longer? A steam engine will last many years. I have never spent a penny on mine, nor had cause to take off the covering. Give the engine lubrication, and its life is practically endless. *Fifth*, attention needed. You will gather from above that the engine needs no attention. The only part to look after other than lubrication and filling up water and paraffin tank, is the nozzle that feeds the burner. This requires cleaning, but I am delighted to say that this, the only drawback, in my opinion, to the older-type Miesse car, has now been overcome. The company now fit a new burner regulator, which allows of cleaning the nozzle, by simply turning and pushing a small handle. It also permits one to turn down the fire as well. The car will stand for hours without attention, and can be instantly started, this being one amongst the many improvements of the latest cars. As I do a certain amount of touring in hilly country, it may be I often pass through the town in which "Medicus" lives. If so, I should have pleasure in giving him a run.—Yours truly,

STEAMER.

The Dourdan Speed Trials.—The Cars at the Starting Point.

As regards the latter, I sincerely hope that this principle of limiting speed will not be changed. It may not be perfect, but do let us stick to it, and not chop and change, which is a fatal mistake. With a view to making next year's Tourist Trophy Race a far greater success than it was this year, I hope the Automobile Club will think fit to ascertain, without delay, the views of:—(a) All the entrants for this year's race. (b) All the principal British manufacturers who did not take part in this year's race. (c) The principal foreign clubs, as the race is an international one. (d) The editors of the principal technical papers in this country. If these suggestions are acted upon, I feel sure that next year's Tourist Trophy Race will prove to be a huge success of great public interest, and not without considerable value to motorists as well as to manufacturers. The popularity of the race will be, I feel sure, greatly enhanced if the order of start is determined by ballot, thus ensuring for each entrant fair play and an equal chance for a good place at the start.

I wish to again urge the great importance of encouraging the use of some other fuel than petrol, one of British manufacture for preference. This is a matter of great national importance, and what better means is there of creating competition in fuel suitable for internal combustion engines on motor-cars than by offering large money prizes such as I suggested in my previous letter?—Yours truly,

H. H. P. DEASY.

### STEAM CAR EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Medicus," re steam cars, being a private owner and having driven a steam car for the past four years, I speak from

### AUTOMATICALLY-CONTROLLED IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "J. R. C.'s" enquiry re automatically advanced and retarded ignition, I may state that my experience of such, as fitted to a Brotherhood car, is quite satisfactory. For driving in traffic and for picking up on all speeds, it is, I think, superior to any other system, and by reducing the number of controlling attachments, the management of the car is, even for the inexperienced, easy, simple and even luxurious.—Yours truly,

CHARLES WELCH FORESTER.

### MASCOTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. C. M. Holloway's letter in your last issue about his black cat as a "Mascot," I would like to inform your readers of my little black Aberdeen terrier, "Toshie," who has travelled many thousands of miles with me—ever since 1898, in fact—on many makes of cars, notably the old type three-wheeled Bollée, an old 6-h.p. M.M.C., a 14-20-h.p. Vinot, &c. He has been run over several times by the old Bollée, caused by his overbalancing on the front seat, and once he was run over by a 6-h.p. De Dion, through being accidentally pitched out, but he has never been injured. Whenever I light up a tube ignition car he is up on the driving seat as soon as the burners begin to roar, just as he mounts immediately he hears the hum of an electrically fired car's coil. If I am by myself, when driving, he always sits on the front seat with me and rests his head on my right arm, when he is not occupied with keeping a look-out ahead, quite oblivious to the fact the tears run

copiously from his eyes in cold weather, which is his favourite occupation. I hope to send you his photograph on my 14-20 h.p. Vinot car shortly.—Yours truly,

ALAN A. L. HICKMAN.

[Doubtless some of our readers will be interested in the picture.]

### SOCIETY OF AUTOMOBILE MECHANIC DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "A. M.'s" letter of your last issue, I am instructed by the committee of the above to say that our chairman of committee wrote, saying he would be pleased to receive him in London on his next visit, and asking his forbearance during the re-formation of the society, but did not hear from him again. I should be pleased to hear from "A. M." as controversy in public is not policy, although the Society is prepared to give any explanation.—Yours truly,

P. LORING, Secretary.

### A NOVEL CHANGE-SPEED GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Those who believe finality has been reached in change-speed gears will be interested in hearing of a simple invention just patented, which obtains from the simple single (two-speed) epicyclic gear train three or more speeds and reverse, and free-wheeling function on all speeds automatically, if required. No clutches are employed and all the wheels are positively and constantly in mesh. A minimum waste of energy due to friction is obtained, there being no friction bands to apply to the various members, as is now the case on motor speed gears. How this simple adaptation has escaped the scrutiny of the originator of the epicyclic gear, and the thousands who have studied and developed his invention in the direction of unnecessary complication, is beyond

The 12-16-h.p. Clement-Talbot which won the Standing Mile race for Chassis under £450 at Blackpool.

comprehension. I myself, experimenting with gears for textile machinery, cycles, power transmitters, and motor-cars for a quarter of a century, have blindly walked afield over much new ground in search of what, after all, remained in the old ground waiting to be unearthed. True it is that the vision which wanders afar overlooks the things at home. This revolutionary form is now being made for cycles and motor-cars, and I hope to send you full particulars of it shortly.—Yours truly,

GEO. STURGESS.

### NON-SKID EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your request that those who have had experience of non-skid tyres should send in their views regarding them has prompted me to write on the subject. I have a pair of Samson's on Continental tyres which were put on in Paris five months ago, and they have given no trouble whatsoever; except that the rivets are getting thin they are as good as new. On my other car—a 12-16-h.p. Swift—I have had experience of other non-skids. Two made last year were good and wore well. This year the type has been improved upon, and the result is somewhat disappointing. The long rivets on one tore quickly out and the tyre beneath the other burst. The tyres, moreover, are spoiled by the process of scraping to which they are subjected before the non-skids are stuck on. One of my tyres not only has places from which the rubber has been completely scraped, but the canvas beneath has been cut and weakened, and the burst referred to resulted from that cause. At the present moment both the non-skids on my car have been put on by myself in order to avoid the damage done to the tyres beneath by scraping, vulcanising, &c., when sent to the works. Using

Sens' Vulcanisator according to the instructions, the home applied non-skids are eminently satisfactory, even though for economy sake I substitute ordinary rubber solution and only use Sens' reviver. By this means I know that my tyres are sound and drive with confidence. Moreover, I can use up home-strengthened old tyres which the works refuse to restud. I have not yet found a house which will supply me with new unapplied non-skids. The makers always allege, incorrectly, that they cannot be put on by an amateur. My advice is re-stud, or have re-studded your old non skids, but, for the sake of the tyre beneath, put them on yourself, as well as new ones, if you can get them.—Yours truly

D. W. SAMWAYS, M.D., D.Sc

### SKEGNESS SPEED TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Did not the most important feature, to the motoring public, of the Skegness meet of the Nottingham Automobile Club escape notice? The Nottingham public patronise the East Coast pleasure and health resorts in large numbers, and naturally it follows that the Notts Automobile Club favour that part for beach meetings.

Is the shifting and shingly beach of Skegness the most suitable one they can find for the purpose? According to reports as to beach conditions, results of the first and last two annual meetings at Skegness have been unsatisfactory. Now a word of that favourite resort of Nottingham people—Mablethorpe—within twenty miles of Skegness. It has been said by Mr. S. F. Edge and many other notable motorists who have motored over its beautiful sands, to possess the "finest stretch of sand suitable for motoring around the English coast." And, while its reach of firm and shingleless beach extends for miles beyond the ancient haven of Saltfleet, eight miles away, the peculiar geographical conditions obtaining are such that the chances of a successful meet are not dependent upon the tides as at Skegness.

The Lincolnshire Automobile Club have held their annual mid-summer races on Mablethorpe beach. Why do not other clubs meet there, since, in these times of police traps and public objections, to the free use of the motor-car on the King's highway, a resort where the motorist can have free rein and make his own speed in safety and without public interference has become absolutely necessary for the testing of cars and drivers and also for the general progress of the colossal industry built up thereon.

The weather conditions are such that Mablethorpe is not only a summer but a winter health resort. The reason, so much less rainfall is registered at Mablethorpe than at neighbouring coast resorts or inland, and consequently is visited more frequently by Old King Sol—the sun cannot be dealt with here. Besides, the beach is free for trial spins all the year round, and of easy access to most motorists, being in close proximity to the Great North Road.—Yours truly,

MABLETHORPE.

### INEFFICIENT LUBRICATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very interested to see the letter from "A Country Garage Owner" with reference to inefficient lubrication. I have often been struck myself with the total absence of any possible means of knowing the amount of oil there was in the base chamber in the majority of Continental cars. The average owner usually receives instructions that he has to allow so many drips per minute through his sight feeds on the dash, and that that will keep the engine efficiently lubricated. From this point the owner goes on blindly. If the number he has been told gives excessive oil to his engine he is a continual nuisance to his fellow creatures. If, however, the quantity of oil dripping through is even one drip too little per minute, ultimately there comes a time when the leakage and waste deplete the base chamber of oil, and bearings wear out or pistons seize up, or something serious happens.

The ideal system of lubrication at the moment seems to lie with the Napier people, whose engines are supplied with a funnel that contains a gauze, which is attached to the base chamber. On the under surface of the base there is a gauge cock; if this cock be opened and the base filled up through the funnel attached to the crank case, when the oil is sufficient in amount it begins to run over and out of the gauge cock. A user may thus have ocular demonstration that his engine is fit for a run of from 150 or 200 miles. The oil is kept in circulation by means of a pump, and is filtered. This is another little British innovation that might well be introduced on to foreign cars if they wish to keep up with their British competitors, and it seems strange that anyone could design and run a high-speed engine without making the oiling mechanism not a thing of chance and dependent upon the doubtful intelligence of a driver, but a matter of scientific certainty.—Yours truly,

SIDNEY LEWIS.

WE shall be glad if the writer of a postcard signed "A Victim" will forward his name and address, in confidence.

THE SOCIETY OF AUTOMOBILE DRIVERS.—With reference to the letter on this society last week, "J. M. F." writes to say that his membership card announces a meeting to be held on the evening of the 29th at Rawlings' Garage, Halkin Street, Belgrave Square, W.

[Correspondents are reminded that letters to the Editor cannot be inserted unless the writer gives his full name and address—not necessarily for publication. Several letters, including one from Mr. W. Gough, have lately been received, in which the address is omitted.]

## CLUBS AND ASSOCIATIONS.

### THE ESSEX COUNTY.

THE Essex County Automobile Club held their final event of the season on Saturday last at Colchester. Luncheon was served at the Red Lion Hotel to a party numbering nearly forty, the chair being taken by Colonel R. P. Davis, J.P. The opportunity was taken of presenting to the Rev. E. T. Maw a handsome silver cup, which formed the first prize for the handicap event at the hill-climbing competition held at Bottledown Hill on October 6th. The following members attended with their cars:—Colonel R. P. Davis, J.P., 40-h.p. De Dietrich; Mr. R. Page, 20-h.p. Mercedes; Mr. Arthur K. Knight, 12-h.p. Humber; Mr. E. J. Hoake, 10-h.p. Panhard; Mr. H. M. Fletcher, 40-h.p. Panhard; Rev. E. T. Maw, 8 11-h.p. Panhard; Mr. A. J. Mills, Renault; Mr. J. S. Whetton, 9 10-h.p. Adams-Hewitt; Mr. Courtney Honyman, 9-10-h.p. Adams-Hewitt; Mr. W. S. Argent, 18-h.p. Mercedes; Mr. F. Lindus Forge, 14-h.p. Star.

THE Crystal Palace Automobile Club held a hill climb on Captain Kidd's Hill at Hartfield, near East Grinstead, on Saturday. At the moment of going to press a revised list of placings reached us from the officials, which will be published in our next issue.

A SUB-COMMITTEE of the Sheffield A.C. has been appointed to report upon the provision of a club garage in the centre of the city.

### THE LAW OF HIRE.

AT the Liverpool High Court of Justice, before Judge Shand, William Lea, of Liverpool, sued Lieut.-Col. Sladen for damages for the

prosecutions, deposed that on the morning of 28th September, with his colleague, both in plain clothes, a journey along Sloane Street was made inside the defendant's 'bus. The vehicle was timed in a lifting fog over a measured furlong in 30 seconds—equal to fifteen miles an hour. He told the defendant that he would be reported "for exceeding the limit." Mr. Dutton.—For exceeding the twelve mile limit. The defendant is not summoned for that offence. The Witness.—I meant to say that I told him that he would be reported for a speed dangerous to the public. Replying to questions in cross-examination, the witness said that both he and the constable got inside as the 'bus was standing still. The constable never got on top—so he could not have come down. Police-constable 67 B, who had not heard the sergeant's evidence, corroborated as to speed, and in reply to the first question in cross-examination said that both he and the sergeant got outside the 'bus in the first instance. They found there was not room outside for two. Mr. Dutton.—So it is not true, as the sergeant has sworn, that you got inside the 'bus at first, and were never outside? Mr. Curtis-Bennett at this stage, without comment, dismissed the summons.

### ROAD REPORTS.

BLAIRGOWRIE.—The Blairgowrie District Committee of the County Council have been discussing motor traffic in that district, and have unanimously agreed to adhere to the original schedule of proposed restrictions, viz.:—In burghs and populous places, at cross roads and corners, and within a hundred yards of these, and in proximity to schools, the speed be limited to ten miles per hour; and that, on the undermentioned roads, speed be restricted to ten miles an hour:—Drumkilbo and Kirkinch road, Coltward and Bruntly road, Cally road

Some of the Competitors in the Crystal Palace Automobile Club's Inaugural Hill Climb at Captain Kidd's Hill, near East Grinstead, on Saturday last.

breaking of a contract with respect to the hire of a car. It transpired that the colonel ordered a new car with canopy to be got ready in time for a month's hire on May 7th last; on that day the car was ready, but the colonel required it in London, as he was there himself at the time. The vehicle was accordingly sent to London, but the colonel, after having subjected it to a test by an expert, rejected it, and accordingly wired William Lea to that effect. Evidence for the defence brought to light the fact that the only trouble with the car was that the clutch was slipping on the test journey, although it had gone perfectly from Liverpool to London, and the two rear wheels were out of truth by about  $\frac{3}{4}$  in. Evidence was called to testify to the fact that new wheels could have been put on if desired within a quarter of an hour, and, as a matter of fact, all the adjustments to the car, including the wheels, could have been effected easily in six hours. Judge Shand, on hearing evidence on both sides, decided that the car was in accordance with the contract, and accordingly gave a verdict for the plaintiff for £50 damages and costs on the higher scale.

### UNSATISFACTORY POLICE EVIDENCE.

AT Westminster Police Court, Charles H. Macpherson, a motor-car driver, was summoned, before Mr. Curtis-Bennett, by the police for "driving in a manner dangerous to the public. Mr. Duerdin Dutton, defending, said the facts were disputed, and there were some peculiar features about the case, therefore while the sergeant gave evidence the constable to corroborate him had better stay out of court. Sergeant Strickland, 2 B, whose special duty is associated with motor-car speed

from Rattray to second milestone beyond Craighall Bridge, Cray, Drumfork, and Blacklunans road, and Kinnochry road.

NORFOLK.—It has been reported to the Highways Committee at King's Lynn that, owing to the number of motorists visiting the King's residence at Sandringham this season, the upkeep of the roads in the district had required double the attention bestowed upon the highways in other parts of the county. The expense of watering and repairing the roads has been considerable.

### MOTOR-CAR ACCIDENTS.

AT Stockport an inquest has been held on the body of Samuel Gill, manager of a Manchester shipping firm, who was killed in a motor-car collision, and a verdict of "Death from misadventure" was returned. The owner of the car, Mr. Harper, a Manchester solicitor, was stunned, and while he was seeking help subsequently someone stole a tin of petrol and robbed Mr. Gill, as he lay unconscious in the road, of the contents of his purse.

MR. LEWIS WALLER has been involved in a serious motor smash near Coventry. He had just taken delivery of a motor-car and was returning to London, when a car, driven by Councillor Bromley, of Coventry, entered the main road from a lane. In endeavouring to avoid a collision Mr. Waller applied the brakes suddenly, and his car was overturned. Mr. Waller, who was driving, a lady occupant, and the chauffeur were thrown out, and the car was badly damaged. The lady was injured, but Mr. Waller and the chauffeur escaped with a shaking. All three returned to London. Councillor Bromley's car was damaged, but the occupants were unhurt.

## CASES UNDER THE MOTOR-CAR ACT.

### SECTIONS 2 AND 9.—REGISTRATION AND SPEED.

At the Lambeth Police Court, Henry Christopher Tryon, 25, an engineer, of St. James's Place, S.W., has been charged, before Mr. Curtis-Bennett, on a warrant granted in consequence of his non-appearance to a summons, with having driven a motor-car at a speed exceeding the limit of twenty miles an hour. The magistrate imposed a penalty of 40s. with 4s. costs.

An interesting point has been raised at Greenwich by Henry Booth, of 13, Peckham Road, Camberwell, summoned before Mr. Baggallay for driving a motor-car in Loampit Vale, Lewisham, beyond the legal speed limit. Over a measured furlong one constable timed defendant's car as doing 15.5 sec., and by another the time was made 15.3.5 sec. The latter worked out at 28 miles 1,489 yards per hour. The defendant alleged there must have been a mistake in the timing, and said he had not exceeded eighteen miles an hour. Mr. Baggallay said there must have been a mistake of 10 sec., and the defendant said he had known differences of 3 sec. in 100 yards. Fined 40s.

Ephraim Fredk. Croesland, motor-car driver, of Archery Place, Blackman Lane, Leeds, was summoned at the Leeds Police court for exceeding the speed limit. He was timed, at Woodhouse Moor, to be travelling at a rate equal to a speed of over thirty-four miles an hour. Defendant admitted that he was exceeding the speed limit, but did so only for a few yards, to give the car a start, as it had been "sticking." The Magistrate remarked: You are the first person I have heard admit that, and then fined him £3 and costs to encourage him in candour.

A motor-car that was being driven by Francis Leid, chauffeur to Mr. Otto Beit, was stopped for fast driving at Finchley, and it was then discovered that it was registered in the name of the late Mr. Alfred Beit. Summoned at Highgate, Leid said that this was an oversight. The car, formerly the property of Mr. Alfred Beit, was now registered in Mr. Otto Beit's name. He was fined £5 for travelling at excessive speed, and ordered to pay costs for not registering the car.

### SECTION 8.—L.G.B. RESTRICTIONS.

At Ayr Sheriff Court, Roderick M. Lawson, motor-car driver, Girvan, was fined £3 3s. for driving through the village of Ballantrae at a speed exceeding ten miles an hour. The police evidence was to the effect that their timings showed the car to have travelled at the rate of twenty-two miles an hour. In defence it was brought out that half a mile outside the village a cyclist had warned Lawson to beware of the police trap, and two ladies who were in the car—one of them Mrs. Wason, wife of Mr. Cathcart Wason, M.P.—spoke to the speed of the car having been reduced after the driver received that warning.

### APPEAL ALLOWED.

At the East Sussex Sessions last week, the case of Fletcher v. Brooman was an appeal by William Fletcher against a conviction at Haywards Heath for driving a motor-car at a speed dangerous to the public. Appearing for the respondents, the police, Mr. E. E. Humphrys said the magistrates suspended the appellant's licence, and sentenced him to a month's hard labour. Having carefully considered the case, on behalf of the police, counsel had come to the conclusion that the sentence could hardly be sustained, and after consulting his friend, Mr. Mellor, who appeared for the appellants, it was proposed that the conviction should be confirmed, but that the sentence of imprisonment should be altered to a fine of £10, and the order suspending the appellant's licence should be discharged, the appellant to pay the costs of the appeal. Mr. Mellor agreed to these terms, and the court made an order accordingly.

### APPEALS TO QUARTER SESSIONS.

At the Michaelmas Quarter Sessions for the Borough of Reading, George J. Fawdrey, a motor-car driver, of Abingdon, appealed against a conviction by the Borough Justices for unlawfully driving a motor-car in Broad Street, on July 21st, in a manner dangerous to the public. The Hon. R. Coventry, for the respondent justices, stated that the fine imposed was one of £2, with £1 2s. 6d. costs. On the day in question the appellant was driving a motor-car from Abingdon to Ascot, and, the races being on, there was a lot of extra traffic in the Reading streets. At the spot where an accident occurred in which the appellant was concerned, there was a somewhat dangerous crossing from West Street to St. Mary's Butts. It was alleged that no horn was sounded, and that the driver drove off. The appellant and his employer having given evidence, the Recorder intimated that he would consider judgment and forward it to the Clerk of the Peace.

At the Surrey Quarter Sessions, at Kingston-on-Thames, Captain William Bennett, of the 3rd Cheshire Regiment, appealed against a conviction by the justices of the Chertsey division for driving a motor-car on the highway to the danger of the public. Mr. Jeff said the facts as stated to the Chertsey Bench were that on December 21st last Captain Bennett was driving a motor-car on the Guildford road, between Chertsey and Ottershaw, when, passing a brougham in which Lady Stern was seated, the car collided with the carriage, with most injurious effects. One of the springs and pole of the carriage were broken, the coachman was thrown into the well of the carriage, and a footman sitting beside him was flung into the roadway, alighting on his head and being rendered temporarily unconscious. The horses bolted, but the coachman managed to retain his hold of the reins until they were pulled up. After hearing the evidence for all parties, the magistrates dismissed the appeal with costs.

### SECTION 1.—RECKLESS DRIVING.

At the Knarborough Petty Sessions Rowland D. Kitson, of Gledhow Hall, Leeds, was charged with driving a motor-car to the danger of the public, at Walshford, on October 6th. Superintendent Keel explained that through the village of Walshford a measured quarter of a mile was worked with an electric wire, and the defendant was timed by the police, and covered the distance at the rate of twenty-two and a-half miles an hour, which, having regard to the place, the nature and condition of the road, and the traffic that might be expected on it, constituted a danger to the public. There was not actually any traffic on the road when the defendant passed with his motor-car, but just before, cyclists and other traffic were on it. Evidence having been given by three police constables, Mr. Greene said the summons was taken out under Section 1 of the Act, which included reckless driving, which he absolutely denied on the part of the defendant. There was no traffic on the road nor anyone about; if there had been the defendant would have gone still slower. He (Mr. Greene) said that the section was never intended for cases of this description, which carried an endorsement of the licence if there was a conviction, and he asked the Bench to say that there was no case. The Chairman (Mr. Sheepshanks) said that if they did that it would be saying that they did not think the speed a dangerous one to go through a village, and they had decided in other cases that it was. Walshford was a dangerous place to go through at that speed, and there must be a conviction. It was not a serious case, but the defendant would be fined £1 and costs.

### SECTION 2.—RECKLESS DRIVING.

At Wolverhampton County Police Court, Charles Ernest Spurrier, of Darlington Street, Wolverhampton, was summoned for riding a motor-bicycle recklessly. Mr. S. R. Rhodes defended. Mr. Rhodes said that it would be foolish for a motor-cyclist to ride down Compton Holloway at the rate at which it was said that the defendant was riding. He submitted that the prosecution had entirely failed to prove that the defendant had ridden recklessly, and if this case had been in another court the defendant would have been entitled to damages on account of a girl on a cycle attempting to cross in front of him when she knew a motor-cycle was approaching. Mr. Mander said that the magistrates were of opinion that the defendant rode at a reckless pace, and Spurrier would be fined £2 and costs.

### LIGHTING.

In the case of a motor-cyclist summoned for not having the front identification plate of his machine properly illuminated, Mr. Chapman, the magistrate at the Greenwich Court, hearing from the defendant that he considered a lamp on the front forks with an aperture at the top casting a beam of light on the plate a sufficient illumination, put the apparatus to a practical test in one of the rooms of the court. It must have been at least partially satisfactory, for his worship dismissed the case on payment of costs.

### POLICE TRAPS.

THERE is a well-watched police "control" between Malton and Scarborough, another at Killington, and a third at Scugglethorpe—all of which lead to the Buckrose (East Riding) Petty Sessions.

THE Coventry road is again infested with police traps, these having recently been notified as occurring at Elmdon and Ashford Brook Bridge.

THERE is a measured quarter of a mile at Walshford, near Knarborough.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case; otherwise no liability will be accepted.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

## COMMENTS.

MOTORIZED CARRIAGE 1700

**C**ONGRATULATIONS have come thickly upon us in connection with the Commemoration Number published last week. Very pleasing have been the letters and messages from the pioneers of the early days, while other communications have testified to the interest of later entrants to the automobile movement. To all those readers who have thus shown their appreciation of our efforts we tender thanks. In many places the supplies were quickly exhausted and difficulty was experienced in obtaining copies; while many readers seem to have ordered special quantities with a view to preservation as a record of a busy decade. We have, however, a few copies left, and these can be still ordered through any Newsagent or Bookstall; or will be sent by post from the office for three halfpence.

### By-Laws or the Act.

THE record has been closed by Lord Salvesen in an action at the instance of the Glasgow and South-Western Railway Company against the Provost, Magistrates, and Councillors of the Burgh of Saltcoats. The company maintain a service of motor-cars for the conveyance for hire of passengers in connection with the train service on their Glasgow and Ardrossan line. These cars ply between the railway stations at Kilwinning and Ardrossan and intermediate places, including the burgh of Saltcoats. They are all registered under the Motor Car Act, 1903, and the drivers are licensed in terms of that Act. The question in the case is whether the pursuers are bound to obtain licences from the defenders under by-laws enacted by them for the regulation of omnibuses or other carriages plying within the burgh. It is said that these by-laws have no application to the company's motor-cars in respect that they are duly registered, and the drivers, guards, and conductors licensed under the Motor Car Act, and that the by-laws are also inapplicable in respect that the service of the pursuers' cars is not confined within the limits of the defenders' jurisdiction. The defenders maintain that the motor-cars and drivers are subject to the by-laws. They, however, deny that they have intimated their intention to enforce the by-laws against the pursuers, and plead that in the circumstances the action should be dismissed.

### The Town Carriage Competition.

**ELSEWHERE** we give the awards in the Town Carriage Competition of the A.C.G.B.I., and would congratulate the judges who dealt with technical details, and the special jury for general appearance, on the promptitude with which these have been made known to the Press and the competitors. Our columns have previously set forth the idea underlying the competition, which was a great success, revealing, however, in the opinion of the judges, some points which require the attention of makers. Thus, insufficient clearance between the ground and the lowest part of the car was observable in some instances, while in several vehicles inferior systems of lubrication

were employed. It is also pointed out that the amount of smoke emitted with the exhaust is the only indication of the quantity of oil in the crank chamber in some cases. This matter of lubrication is therefore one upon which these official experts would like to see an improvement.

### Points of Criticism.

**EASE** of cleaning the machinery and facility in starting were two points that struck the judges as being generally well studied by designers, and, as a rule, the exhaust vent was well placed. But some cars were wanting with regard to accessibility for the purpose of effecting adjustments and repairs, while vibration and noise have yet to be minimised in a few cars. On the thirty-mile run which formed a part of the competition the official observers testified that the vehicles ran smoothly and well, and that great advance had been made towards the production of satisfactory vehicles for town service. They noted, too, that adequate tyres and effective brakes were uniformly fitted, although attention may yet be given to the design of vehicles with reference to turning radius. In some of the cars entered this was too great to enable the vehicle to be turned in most of the streets of London without manoeuvring. It is very satisfactory that neither judges nor jury have found faults with fundamental matters; their only criticisms are of a minor order, and while we may congratulate the medallists, we may also add our tribute to the many excellent vehicles that narrowly escaped distinction.

### The Awards.

**THERE** were thirty-two cars in the competition, and four gold medals have been awarded—electricity, petrol, and steam each receiving recognition. Mr. Carl Oppermann, whose electrical vehicle won distinction in Class "A," has long been identified with that class of automobile, while the Wolseley Co.'s limousine is a well-known type. In Class B the Electromobile and the White steam cars won gold medals, Mr. Frederic Coleman attaining his award with the two vehicles which appeared at the head of the procession illustrated on page 710 of our last issue. Ease of manoeuvring was specially noticeable in the Adams-Hewitt car; the comfort of passengers was a feature of the Dennis vehicle. These, and other special points of distinction, are, however, set forth in the judges' recommendations, given on another page. The report of the jury on carriage work is also presented in full elsewhere.

### A Colonial Dilemma.

**STRANGER** even than "Octroi" complications in France are the difficulties that arise between some of the colonies in Australia. Vehicles drawn by oxen or horses between New South Wales and Queensland have to be fumigated. That is a regulation that has long been enforced, and the motor-car has not yet succeeded in over-riding the general rule. A ridiculous situation recently overtook a party of motorists, who tried to cross the border line, so as to reach New South Wales

from Queensland. The party included Mr. John Lawler, a well-known Sydney citizen, with large commercial interests, who left Sydney with the intention of testing his car over the long journey through the New England plateau to Brisbane, and home by the northern rivers. The run to Brisbane was made in five days, and the return was begun. When Macpherson's Gap, some six miles from Murwillumbah, was reached, a Government officer forbade further progress. The motorist's wife and two daughters were without food or shelter or sufficient clothing for a night in the open, and he had to go on to Murwillumbah, leaving them behind, in order to communicate with the authorities. The supervising officer pointed out that the gatekeeper had acted under the regulation directing the fumigation of vehicles to which animals are attached. As to whether motor-cars are to be so treated was a new question, but evidently the gatekeeper was not going to take any risks.

◆ ◆ ◆  
**The Wolseley Co.'s** 1907 Models. On Tuesday last the Wolseley Tool and Motor Car Co., Ltd., invited their agents in various parts of the country, as well as a number of members of the Press, to inspect their extensive works at Adderley Park, near Birmingham, and also to examine the new models the company are introducing for the 1907 season. Writing as we go to press, it is impossible to fully clearly in-

Colonel Hornsby Drake, of Thedden Grange, Alton, at the wheel of his 1907-type 30-h.p. Deane Car. The car has comfortable seating accommodation at the rear for three on the back seat and for two more on chair seats which fold up against the side.

dicating the enormous extent of the concern, but some idea may be gathered from the fact that at the Birmingham works over 1,400 workmen are employed, while at the factory at Crayford, Kent, a further 700 are engaged. Mr. J. D. Siddeley presided at the luncheon which followed the inspection of the different shops, and in the course of his remarks regarding the future of the Wolseley Co., announced that henceforth attention would entirely be confined to cars with vertical engines. For 1907 seven models of cars for touring and town use are being made; they are all known as "Siddeleys," and comprise a new 10-h.p. double-cylinder with live axle; four sizes of four-cylinder vehicles, 15-h.p., 18-h.p., 30-h.p., and 40-h.p., and finally a 45-h.p. six-cylinder. The 15-h.p. and 30-h.p. cars have live axles, the 18-h.p. is made with both a live axle and a side chain drive, while the two most powerful machines are chain driven. As for the details of the new models, we must reserve a description of these until our next issue. In the meantime suffice it to say that they are such as should fully maintain the reputation of the Wolseley Co.

#### A New Offence.

It has taken nearly three years' operation of the Motor Car Act for the legal luminaries to discover that it creates a new offence of "aiding and abetting"—an offence which is certainly not specified in the present Act, although not wholly absent from the minds of the Royal Commissioners in considering the circumstances of the future. In July last Mr. Harvey Du Cros, jun., was travelling on his motor-car through Warwickshire, Miss Victoria Godwin driving, and Mr. Charles Sangster being a passenger. The police alleged that the car was being driven at a dangerous pace, and Mr. Du Cros was convicted at the police court, the conviction being affirmed at the Quarter Sessions, of driving at an excessive speed, the justices holding that it was unnecessary to show that the defendant was at the time in actual control of the car. The defendant appealed against the conviction on the ground that he could not be convicted of excessive driving, since he was not the "driver," while at the same time he could not be held guilty of "aiding and abetting," as the principal offender, Miss Godwin, had not been proceeded against. Mr. Du Cros then appealed to the King's Bench Division, where the case has been further argued before the Lord Chief Justice, Mr. Justice Ridley and Mr. Justice Darling.

#### The Legal View.

◆ ◆ ◆  
 EVENTUALLY the Lord Chief Justice gave judgment dismissing the appeal with costs. He said that the case raised two points of considerable interest, one of law and the other as to the proper conclusion to be drawn from the way the case was stated. On the technical legal point he thought the appellant, although not originally charged with aiding and abetting, could be convicted, because under the authorities persons aiding and abetting were principal offenders. As to the question of evidence, although he did not quite pass by the fact that the car was the appellant's, it had very little weight in the matter. The justices had found as a fact that this experienced man must have known that the speed was dangerous, and that he was practically controlling the car. Without laying down any general principle, therefore, it was impossible to say that there was no evidence upon which he could be properly convicted. The other judges concurred.

#### Appeal Wanted.

◆ ◆ ◆  
 THIS judgment is of the greatest importance to all owners of cars—whether they employ professional chauffeurs or not. For the police have power, if the ruling of the Lord Chief Justice is correct, to proceed against the owner when riding on the car, whether he is driving or not. There are many cases which may be readily imagined where such a law would work real injustice. The owner might be asleep in the tonneau and the chauffeur enjoying a bright little spin on his own account. According to the newly-found law the somnolent passenger may, in such a case, be regarded as aiding and abetting the offence. The case is so important that we trust one of the many societies associated with motoring will carry it to the House of Lords, in order to ascertain whether this latest judicial pronouncement is a really sound interpretation of the law.

#### The Silent Motor-Bus.

◆ ◆ ◆  
 THE hint given by Mr. Burns in the House of Commons, the other evening, that the nuisance of the excessive noise of the motor-bus was being dealt with to some extent by administrative action on the part of the police, really means more than appears on the surface. It is authoritatively reported that in place of the score of vehicles a day that were being licensed a few months ago, less than a dozen motor-buses have satisfied Scotland Yard during the past four or five weeks. The Commissioner, spurred to activity by the correspondence in the public Press, and the attitude of certain public men, has decreed that a

rigorous noise test will have to be passed by all motor-buses before they are licensed for the road. The result has been to slacken enterprise for awhile and lengthen the life of the 'bus horse. From all we can learn, the police have been unnecessarily severe in their requirements as to silence. This is a pity, as there is no doubt that designers were steadily approaching to quietness, and although the motor-buses of to-day might not gain medals in a Town Carriage Competition, they show a vast improvement on the types in service a year ago.

#### The Scottish Club.

THE first meeting of the General Committee of the Scottish Automobile Club, under the revised constitution of the club, has been held at Glasgow, when eight committees were elected to deal with various sections of club activity. Mr. H. M. Napier was elected chairman of the committee, with Messrs. J. Adam and J. Wilson as vice-chairmen. Perhaps the matter of most general interest was the decision to hold the Reliability Trial next year about the same time as in 1906. The arrangements have been remitted to the Trials and Competitions

question as to speed limits. This power is at present exercised by the central authorities, and, on the whole, it has not worked badly. Certainly such would not have been the case had the limitations of speed and the general restriction of the rights of motorists been left entirely in the hands of the local authorities with only a parochial view of the situation.

#### New Company Flotation.

THE recently issued balance-sheets of motor-car companies have revealed such phenomenal progress and success that public interest in the shares of automobile concerns has been greatly kindled during the past week. The success that has thus been obtained may be followed by the flotation of several new companies whose chances of favour with investors may be based upon profits and dividends declared by older establishments. Over-capitalisation on the part of fresh ventures should be carefully watched and prospectuses closely scrutinised on this point, otherwise the disappointment which must inevitably follow such flotations will lead to a general weakening of the present strong position. It would be a misfortune to the industry if

The Gaillon Hill Climb.—Competitors at the Starting Point.

Committee, with power to call into consultation in the framing of rules and conditions the members of any other sub-committee they may deem desirable.

#### County Councils and Motor-cars.

THE Executive Council of the County Council Association has received the report of its Highway and Motor-cars Committee, which had adopted the following resolution:—"That powers should be given to a county council to establish a speed limit of twelve miles per hour for the whole or part of the area of a non-county borough or urban district within the administrative county under similar conditions to those under which it is proposed the Council of a county borough may establish such a limit within their area." They also approved of the recommendation that the revenue derived from the taxation of motor-cars should be devoted to the improvement of roads, and a resolution was passed that the proposed increased scale of charges with respect to motor vehicles was grossly inadequate. In view of this proposal, it is to be hoped that the forthcoming conference of motorists will deal very carefully with the

any such course followed the recent successes, and the present seems the opportune moment to utter a note of warning. It is not enough to estimate small works at extravagant values, and then expect the public to subscribe. New companies should only come before the public based on reasonable expectations of yielding returns to shareholders, and such is impossible when over-capitalisation handicaps the company in its initial stage.

#### Giving the Name of Driver.

THE Scottish Automobile Club have had brought to their notice that it is the practice of the police authorities in one county, where measured distances are in vogue and where the cars are not stopped and offences against the speed limit communicated, to send to the owner of the car, after they have discovered his name and address from the Registrar, to inquire the name and address of the driver as well as those of the other passengers at the time when the speed limit was alleged to be exceeded. They have been advised that under such circumstances the car owner is not obliged to communicate the names of his passengers. With regard

to the communication of the name and address of the driver of the car, it has to be pointed out that these can only be demanded under Section 1 of the Motor Car Act, 1903, and then only if an offence—reckless or negligent driving or the like—has been committed under that section, and it is even doubtful whether the obligation under that section is absolute, except where the driver himself has refused to give the information or has given a false name and address. Consequently it would appear that a car owner is not obliged on such an application to declare the name and address of the driver of his car, where the offence was one of exceeding the speed limit only.

### Roads in Ireland.

THANKS to the well-directed efforts of the Irish Roads Improvement Association, the Emerald Isle should become a passable country before many years have gone. Their latest publication, which has been circulated among the local authorities responsible for the maintenance of the highways, contains a paper which Mr. P. C. Cowan, the Chief Engineering Inspector of the Local Government Board for the country, prepared some time ago, emphasising the necessity of a really adequate scheme of road construction being carried through. To this is added a contribution on the Economics of Road Management, by Mr. John Brown, F.R.S., in which he points to some reforms in the management of county roads which seem eminently desirable. One of the existing defects is the smallness of the various contracts, which leads to waste, want of uniformity and delay. Thus the County Down Council recently dealt with proposals for road maintenance submitted by the District Council of Downpatrick, which numbered 147; 72 of these separate contracts did not exceed £25 each, and 48 were no higher than £12 10s. Against this extravagant and inefficient system is cited the experience of many road surveyors in England who are opposed to such ridiculous piecemeal ways of doing things. We trust the lesson will not be rejected by the responsible people in Ireland.

### Commercial Motor Users.

FINALITY does not yet seem to have been reached with regard to the designation of the Motor Van, Wagon, and Omnibus Users' Association, the officers of which must be sorely tried by its long comprehensive title. Hence we must express sympathy with those members of the Association who have been seeking to secure its shortening to "The Commercial Motor Users' Association." It is, however, satisfactory to know that Professor Hele-Shaw's motion for delay has been adopted, so that suggestions may be invited and a name ultimately discovered that will have the advantage of brevity as well as adequately distinguish the particular work that the Association is doing in the automobile world.

### A New Mark for Motors.

So far both Mr. Burns and Mr. Gladstone have dealt wisely with regard to the automobile situation, and we trust they will continue to turn a deaf ear to the clamour of minor minds. Mr. Markham—who seems to be out-Wasoning Weir and Gallowaying Cathcart—has had a sheaf of questions, but the President of the Local Government Board has administered a cooling douche each time. The other day, in reply to this budding questioner, Mr. Burns said he had received applications from local authorities in Carnarvon, West Suffolk, and Essex to reduce the speed of motor-cars in certain areas to ten miles an hour. In the first case he had not felt able to comply: in the others the matter was still under consideration. Then Mr. Markham turned his attention to the Home Secretary, suggesting that the licences of motor-buses should be withdrawn owing to their skidding tendencies. Mr. Gladstone naively replied that a general prohibition of the use of motor-omnibuses would require the authority of Parliament. Still, Mr. Markham is unflinched, and has given notice to ask the First

Commissioner of Works whether he is aware that the flowers in Parliament-square, facing Canning's statue, by which the motor-cars pass, have this season been killed, while the flowers in the rest of the square, by which automobiles do not pass, have not been affected. Mr. Markham wishes to know whether the First Commissioner has any official reports showing that petrol smoke was the cause of the flowers dying. Possibly the Royal Horticultural Society may give the matter attention. But, whatever be the effect of automobiles on flowers, this much may be told Mr. Markham with regard to apples—viz., that the crop in Somersetshire has been phenomenally good, and the local growers attribute it to the fact that the dust raised by cars has prevented blight. What will Mr. Markham want to know next?

### Throwing Stones.

FOLLOWING the educational campaign of the Motor Union with regard to the stoning of motorists by small and other boys on the roadside comes a magisterial warning which should prove effective in some degree. Before the commencement of business at the Enfield Police Court on Monday, the magistrate, Mr. J. Ford, said he wanted to call the attention of the Press to a most deadly and dangerous trick that had been adopted by boys in the neighbourhood. They had taken to throwing stones at motor-cars passing along the road. In two cases they had succeeded in striking the cars. In another case they struck the chauffeur in the face about an inch from his eye. The only way to reach these boys was for the matter to be brought under the notice of schoolmasters in the district, who would then take such steps as were necessary to stop the boys from indulging in such a dangerous practice. At the October meeting of the General Committee of the Motor Union, the replies of the chief constables and local educational authorities to the circular addressed to them by the Motor Union with regard to the stone-throwing nuisance were presented, and it was recognised that, as the result of the action taken by these authorities, the stone-throwing danger had been abated.

WE regret to learn of the sudden death, on Tuesday last, of Mr. Dan Albone, of Biggleswade, the well-known manufacturer of agricultural motors.

MESSRS. DUCROS-MERCEDES, Ltd., of Long Acre, London, W.C., have removed into their new repair department in the splendid premises which have been erected for the accommodation of their business.

THE Standard Metal Engraving Company are supplying radiator name plates to many of the principal motor-car makers on the Continent as well as at home. These are of neat design as well as good construction.

BARNETT'S MOTORS, LTD., formally opened their new garage and repair shop in Bristol Street, Birmingham, by a run on a fleet of Renault cars to Tewkesbury last Thursday week, in which a number of representatives of the Press participated. Before starting, an inspection of the garage was made, from which it was evident that no expense or trouble had been spared to build an up-to-date establishment. The skylights are lofty and admit an unlimited amount of light by day, and a complete electrical installation permits of the most delicate tasks being performed after dark. The building is heated by means of hot-water pipes, and a uniform temperature is always kept up. In addition to being able to carry out repairs of all kinds, plant is available for the charging of accumulators, and a stock of tyres, Renault spare parts, &c., is kept on hand. Taken all round, we should say the new garage is one of the best-lighted and equipped in the Midland counties; it is under the direct supervision of Mr. W. H. Weekes, who has had many years' experience in the motor industry. We were invited by Messrs. Barnetts to a run on a 20-35-h.p. Renault, for which they are agents, and for hill-climbing, smoothness, and silence of running have never travelled in a finer car. The party who took part in the run included the directors—Messrs. E. Winn, Frank S. Murray, and H. H. Barnett—and Messrs. C. Blewitt (solicitor to the Motor Union), J. C. Gilbert, and W. H. Weekes.

## THE CAMERA AND THE CAR.

**A**UTOMOBILISM has introduced many an Englishman to the beauties of his native land. Hitherto he has had but a circumscribed view, limited to the sidelong glances that are possible in railway carriages and other contrivances of travel. Or else he has gone by coach—slow-coach might be an appropriate phrase in these motor-car days—and his tours have been restricted by the limited powers of endurance possessed by horses.

But the coming of the car has given new impressions and allowed the people of every country to revel in natural beauties until they have been able to know their native land. Armed with a camera motorists have become explorers in a mild sort of way, and the automobile has done much to encourage people to see more of their own country before encountering the Customs officials of other lands. This is all to the national advantage; and not only does it tend to the circulation of money within the area in which it is made, but it trains the head and eye to the appreciation of homely beauties. The man who in a few days can explore the sweet delights of Devonshire lanes, then through charming country reach the wilder scenery of Wales, on the way to the Lakeland culmination of beauteous landscape, will not be disposed to endure the worries of long journeys across Continents cooped up with many restless spirits all anxious to see other lands because they do not know their own.

roads, which are now being steadily restored to old-time prosperity. Of course the revival will not prove a repetition of the old ways—they have been left behind by the advance of the age. But the little villages by the main roads that were stranded from comfort when railways diverted traffic therefrom, and the

hostelries that vainly endeavour to present a good appearance to the world, will rejoice again.

We have been led to this reflection while looking through the photographs submitted in the *M.C.J.* Photographic Competition recently decided.

The first prize was awarded to Miss M. M. Davy, of Cuckfield, whose new view of "Washing Day" should encourage the belief in the domesticity of the car. The two other awards were made to readers who submitted views of castles in parts of the country greatly distant from each other. Mr. James Southey, of Southsea, won distinction for his picture of Arundel Castle, while Miss E. N. Fisher, of Warlingham, sent a picture showing a car on the bridge over the Aln, with Alnwick Castle and the Percy Lion in the background.

Such interesting pictures recall reminiscences of pleasant holidays, and add to the joys of motoring, for, with the capacity of a well-equipped touring car to hold apparatus, &c., the photographer with a car has a distinct advantage over even the snapshot finder who goes by train or cycle; while the range of subjects is away from the familiar track and often well-nigh impossible to those who depend on ordinary means of locomotion. It is frequently urged that the man who tours by auto-

Alnwick Castle and the Percy Lion.  
[Prize Photo by Miss E. N. Fisher.]

The motor-car may thus become a means to patriotism, to a keener appreciation of one's own country and a fonder desire to see all that it possesses before going beyond its borders. Already this is an apparent fact; we look to the encouragement of the tendency by the enterprise of all concerned with the

mobile is indifferent to the claims of scenery and quite willing to rush heedlessly by delights that entrance the pedestrian and the ordinary cyclist. The truth is that the motorist's sense of beauty has been quickened. He sees so much that he has become a connoisseur in landscapes.

## THE BROWN 40-h.p. SIX-CYLINDER CAR.

**A**S mentioned in our last issue, Messrs. Brown Bros., Ltd., have lately introduced a 40-h.p. six-cylinder car. The new machine follows the general arrangement of live-axle vehicles, the object having been not so much to introduce novel features as to turn out a soundly-built "six" at a price within reach of those at present using four-cylinder cars. The frame is of pressed steel, narrowed in front to increase the lock of the steering wheels. The cylinders are 100 mm. bore by 130 mm. stroke, and, although cast separately, are mounted in pairs on the crank chamber, the latter being of a special design. The valves, which are all mechanically operated, are located on opposite sides of the cylinders. The valve tappets are fitted with a roller movement at the cam ends, and at the other with screw adjustment. The cam shafts are above the crank chamber, and supported in separate casings, split horizontally, the guides for the tappets being fixed to the upper portions so that all can be easily inspected. The crank shaft itself is supported by four bearings, each of substantial length. Large inspection doors are fitted to the base chamber below each pair of connecting rods. The carburettor is of a special type, it comprising two spraying jets and mixing chambers fed from a common float chamber, each jet furnishing the mixture for three cylinders. Both automatic and hand-controlled air valves are provided. Two systems of high-tension ignition—magneto and accumulators

which run on ball bearings, is adapted to give four forward speeds, with direct drive on top and a reverse, they being controlled by a single lever working in a "gate" sector. From the gear-box the power is transmitted to the rear live axle through a shaft having enclosed universal joints at each end and bevel gear. The rear road wheels run on ball bearings on the casing, the power being transmitted through squares on the end of the live axle, which has thus only to withstand the driving strain, the weight of the car being carried by the sleeve. Both foot and hand operated brakes are provided; they are all of the contracting metal-to-metal type, a noticeable feature of those on the hind wheels being that they are entirely enclosed, and consequently protected from mud and dirt. The steering gear is of the worm and segment pattern, and the steering bar is located behind the front H-section axle. The usual four longitudinal springs are supplemented by a transverse one at the rear, and a detachable mud-protecting metal screen is fitted below the engine and gear-box, spring clips affixed to the side members of the frame permitting of its easy removal when necessary. The car has a wheel base of 10 ft. 6 in., so that any type of body can be fitted to it. In the course of a short run we were much impressed with the easy, smooth riding qualities of the new vehicle, an impression which was deepened by its excellent performance up West Hill, Hampstead, noted not so much for its steepness as for the long, steady rise, which tries the hill-climbing capabilities of cars to the utmost.

General View of Chassis of Brown Six-Cylinder Car.

and coil—are provided. The magneto has a fixed firing point, but that of the accumulator ignition can be advanced and retarded by means of a lever on the steering wheel. Independent sparking plugs are fitted, but are screwed in pairs into a special Y-shaped holder, which in turn is screwed into the combustion chamber. The magneto is in an accessible position, and the contacts are so arranged that they can be removed for cleaning purposes without having to dismount the machine. As will be seen from the illustration of the chassis, each pair of cylinders exhaust into an expanding chamber cast with longitudinal fins with the object of radiating the heat as quickly as possible. The water-circulating pump for the honeycomb radiator is gear driven, the flat pulley for the fan belt drive being keyed to the fore end of the pump spindle, the latter being also extended rearwards for the oil-circulating pump. This draws the oil from a cylindrical tank strapped to the off-side of the chassis, and delivers it through sight feeds on the dashboard to the various bearings. The clutch is of the leather-faced cone type; it is withdrawn by a pedal working in conjunction with a cam movement, by means of which, once the clutch is disengaged, it can be kept in that position without the driver having to exert pressure through his foot against the spring. The shaft between the clutch and gear-box is furnished with a universal joint to provide for any want of alignment between the two parts. The gear-box, the shafts of

AFTER an existence of fifteen years the Dundee and District Coachmen's Club is to be wound up, the falling off of subscribers being attributed to the supersession of the horse and carriage by the motor-car.

THE value of the motor-cars and parts exported from the United States during August last is returned at £93,570, as compared with only £52,170 in the corresponding month of 1895. Of the total, £30,000 is to the credit of Canada, England taking second place with £24,500.

MR. F. E. BUNTING, of the Wealdstone Motor Garage, and also of Peterborough Road, Harrow-on-Hill, repairs motor tyres and keeps all sizes in stock. A feature of the business is that tyres are lent to motorists while their own are under repair—an enterprise sufficiently novel to be worthy of note.

THE Borough Council of Stepney, E., have authorised their electrical department to adopt a fixed rate for charging accumulators of motor-cars as follows:—A fixed charge is to be made of 5s. per car per charge, and 1s. per ignition battery or other small portable battery, per charge, to cover labour, garage and other incidental costs, plus a further charge of 8d. per unit for current consumed between sunset and 10 p.m. and 1d. per unit at all other times. For cars and batteries charged regularly the fixed charge per car shall not exceed 10s. in any one month, and per ignition or other portable battery not more than 2s.

## MOTOR BODY WORK.

**S**PECIAL interest attaches to the full report of the jury appointed to deal with the general appearance and finish of the body work of cars entered in the A.C.G.B.I.'s Town Carriage Competition, the results of which are tabulated on page 778. The jury consisted of Messrs. W. Gilchrist, E. C. Large, D. H. T. Peplow, C. D. Rose, M.P., and Captain S. H. Skeffington-Smyth, D.S.O., and their report is as follows:—  
In considering the order of merit under "B," attention was given to the appearance of the car as a whole, the suitability of the design for a town carriage, the proportions of the body and the gracefulness of the lines. As many of the carriages entered for competition had been painted and finished to customers' requirements, the appropriateness or otherwise of the colours used was not regarded, the finish of the work only being taken into consideration.

In many of the cars the effect of placing the body where it was in relation to the wheels was not what could be accepted as appropriate for an ideal town motor carriage. The superstructure did not appear to be properly balanced on the base. In some cases the wheel base was not of sufficient length to give dignity to the body or gracefulness to the appearance of the car—a point of some importance.

In many cases the mudguards came so far beyond the line of opening in the door that the amount of room for access was curtailed. From the position of the steps in some cases it was not possible to enter the carriage except at an awkward

Under "N" the attention of the judges was directed to the appropriateness and suitability of the materials used, and the whole of the interior fittings for the comfort and convenience of the occupants. These included the cushions and rests, the occasional seats, the foot room, in landaulets the ease of opening and closing the hoods, the suitability and character of the little conveniences and pockets, especially for books of reference, &c., usually carried in town carriages. These varied greatly in the cars; some had an advantage in one respect which they lost in others. Attention was particularly given to the arrangements for opening and closing the hoods.

They were not easily moved, and required a skilled assistant. The absence of handles for this purpose in the interior was noticed. It was recognised that the position of the driver's seat in relation to the body, as compared with that in a horse-drawn carriage, made it difficult to dispose of the front pillars where four fixed seats were provided, which gave to some of the open four-seated landaus an unsightly appearance. There is room here for some ingenious device which will make an open and closed carriage possible, while preserving a general graceful outline.

The modern interior fittings used displayed considerable ingenuity. There was, however, very

little accommodation for small parcels. In some instances the doors to the hind boot were too small, and these should be permanently boarded off from the interior of the carriage, in order to prevent the possible abstraction of any parcel from the outside.

Very few of the seats were really comfortable. In several

The Wolseley Co.'s 15-h.p. Siddeley Car which secured a Gold Medal in Class A.

The White 18-h.p. Double Landaulet which secured a Gold Medal in Class B.

angle. The doors in some of the cars did not open sufficiently.

It was recognised that the endeavour to keep a short wheel base interfered with the freedom of the carriage builder in designing the body, but easy and safe access and egress should not be sacrificed.

of the cars there were projections on the floor space which should be avoided.

The workmanship displayed was excellent throughout. The proper upholstery and fitting up of a town carriage is the result of years of experience, taste, and knowledge.

## WHAT A GOVERNOR IS AND DOES.

By A. E. S. CRAIG.

IT may be asked, in view of the tendency of modern practice to discard the governor altogether on the motors of automobiles, whether it matters what a governor is or what it does, seeing how well we are getting on without it. But it does not follow that because the governor is being cold-shouldered for the nonce that it is either useless or extinct; on the contrary, it is a most useful appendage, and will in all probability be reinstated in favour in the motors of the future in some form or another, simply because the principle of automatically governing a motor is right, and not to do so is wrong. I say automatically, because, of course, when we allude to a governor we almost invariably refer to the automatic control of the speed of the engine; and I might even go further, and say that we picture to ourselves two little balls flying round for all they are worth somewhere at the front end of the motor.

Governors on internal combustion motors are generally of the type known as centrifugal; which word, I may be permitted to explain—as this article is intended principally for beginners—means to fly from the centre, and relates to the well-known fact that the faster a weight is revolved the more it tends to recede from its axis. We take advantage of this law of nature

Mr. Dermot H. Doyne, of St. Austin's Abbey, Tullow, on his Brotherhood Car.

Mr. Doyne is one of the most popular hunting men in Ireland, and uses his car very extensively for attending meets in all parts of that country. The picture is interesting, as the vehicle illustrated is the original Brotherhood, which has now been continuously on the road for over two years.

to govern a motor, because experience shows it is the most effective and reliable method of doing so. The only other principle which offers itself conveniently to the purpose is made use of in governors of the suction type, in which the varying pressures of the gases in the induction or exhaust pipes control the speed of the engine. No matter by which principle the initial movements are provided, the result is always more or less the same—the engine is governed on the throttle; that is to say, the speed is regulated by throttling the admission of fuel to the cylinders. It does not matter in the slightest that some people say they “govern on the exhaust,” or “govern on the inlet,” or “govern on the throttle,” for they all govern by throttling.

Let us first briefly consider the initial actions. In governors of the centrifugal type two weights are so fixed to a revolving shaft of the engine that they are normally held at the inner limit of their movement by one or more springs, but are capable of a small outward extension when the force compelling them to do so is great enough to overcome more or less the contractile power of the springs. The slight movement alluded to is precisely what is required, for it varies automatically with

any alteration in the revolutions of the motor, and to couple it up to throttle, or hold open, one of the devices explained further on, is merely a matter of one or two rods and levers.

In governors of the suction type there is no revolving part, but in its place a simple sliding action is produced. Usually a piston or diaphragm working in a sleeve is fitted, and a spring is so attached as to give the necessary constant tendency in one direction to the same. On the side remote from the piston or diaphragm the varying tendency to overcome the action of the spring is obtained by the different pressures of gases, caused by the greater or less speed of the engine. Either the partial vacuum of the inrushing explosive vapour may be employed, or the greater than atmospheric pressure of the burnt gases may be used. Here again we obtain our automatic initial movements, and the same, or even more simple means of coupling up, to whatever form of throttling we select, can be employed.

We now come to the various modes of obtaining the throttling effect. That which is generally believed to be the most ancient as regards automobile engines is the system of “governing on the exhaust.” I happen to know that this is not really the oldest method, but this by the way. Governing on the exhaust simply means that we prevent the exhaust valves from opening during as many exhaust strokes as the engine is running too fast to our liking. Hence we prevent any fresh charges from being sucked into the cylinders and so slow down the motor to its normal speed. We throttle the exhaust. This system is always worked by a centrifugal governor, and the mechanism is either so arranged as to work on the “hit and miss” principle, that is to say the valves are either kept entirely closed, or allowed to open quite normally; or the “variable lift” method may be employed, so that intermediate gradations of throttling are obtained. This latter system is, I consider, for several reasons, very economical and efficient.

When we “govern on the inlet” we deal with the induction valves instead of the exhaust; but in this case the “hit and miss” system is seldom if ever employed, the variable lift being almost exclusively adopted. Governing on the inlet also is worked by a centrifugal governor. When we “govern on the throttle” it is usually implied that we leave the valves themselves alone, and confine our attentions to the induction pipe. Throttles of this description are generally known as either “butterfly” or “piston,” the former turning on a pivot, and the latter, of course, merely sliding. In this style of regulator we have the choice of the centrifugal or suction movement, the former being largely the favourite. The simplest governor of all, but which unfortunately is only suitable for slow-speed engines, works merely by the inertia of a weight, so pivoted that it rocks more or less according to the speed of the motor. It can be adjusted by a spring to “cut out” at approximately the required number of revolutions, and is best adapted to work a check valve on the hit and miss system.

Some governors are more ambitious in their controlling efforts than others; one specially ingenious invention not only regulates the engine speed, but at the same time controls the mixture and the point of ignition. Several devices for automatically retarding the ignition are applied to automobile engines besides the one just mentioned; but although the supposed advantages of doing so, and several methods whereby it may be done, were expounded nearly six years ago, it has not been enthusiastically taken up by designers generally. A somewhat unusual thing to govern automatically is the circulating water; but this is done in some motors running on paraffin, the object being to keep the cylinders as near as possible at a constant temperature irrespective of the load, and in practice the idea works perfectly. Automatic auxiliary air devices for carburettors are almost invariably worked by suction, although one notable exception controls the mixture by utilising the varying pressure of the circulating water, whilst yet another draws into play the fluctuations of the exhaust.

MR. H. E. RUSSELL is the manager of the new motor garage recently opened at 262, Liscard Road, Liscard.

## THE 1907 ENFIELD CARS.

WHILE a number of cars have been turned out during the past season by the Enfield Autocar Company, Ltd., of Redditch, Mr. E. H. Lancaster, the managing director, has been mainly engaged in completing the equipment of the factory and in preparing for an active output for the coming year, and we are now able to announce that the 1907 models of pleasure-cars will consist of two types—25-h.p. and 15-h.p. Dealing first with the larger of these, it will be seen from the drawing we publish herewith that not only is the car on modern lines throughout, but that the design is one which combines strength with lightness. The frame, on which the engine and gear-box are directly supported, is of pressed steel, the side members being quite straight. The motive power is supplied by a 25-h.p. motor; the four cylinders, which are cast in pairs, are 120 mm. bore by 135 mm. stroke. The valves, which are all mechanically operated, are located on opposite sides and actuated off separate cam shafts. A feature of the engine is that the crank-shaft, in addition to the gear-box shafts and axles, runs on ball bearings. Large inspection doors are fitted to the crank chamber, which is also arranged so that the bottom half can be removed without disturbing the crank-shaft bearings in any way. The petrol, which is carried in a tank at the rear, is pressure fed to a special form of automatic carburettor.

Elevation of Chassis of Enfield 25-h.p. Car.

Following modern practice, two systems of high-tension ignition are provided—gear-driven magneto and coil and accumulators. The latter is of the synchronised type, a single-trembler coil being employed in conjunction with a high-tension distributor. The water circulation is maintained by a combined honeycomb radiator and tank, with air-inducing fan and a gear-driven pump. The engine is lubricated by means of a pump, in which the pressure of the exhaust gases is utilised. The normal speed of the motor is 900 revolutions per minute, but by means of the throttle it can be varied from 200 to 1,200 revolutions.

Passing now to the transmission, the power of the engine is conveyed to the gear-box through a multiple disc clutch of the Hele-Shaw type, the shaft between the two parts being provided with a universal joint to permit of either being readily removed without disturbing the other. The gear-box is adapted to give three speeds forward, with direct drive on top, and a reverse, these being controlled by a single lever working in a "gate." The final transmission is by a cardan shaft gear to a well-designed live axle. Universal joints are fitted to both ends of the propeller shaft; they are of a special design, being provided with renewable bushes, with special provision for lubrication. The rear road wheels run on ball bearings on the casing, and receive the power through squares on the ends of the live axle, which has only the driving strain to withstand, the weight of the car being taken by the sleeve.

The foot brake is of the contracting type, and acts on a drum 3 in. wide at the rear of the gear-box; the band-operated brakes are of the internal expanding variety, working inside drums attached to the rear road wheels; all braking surfaces are metal-to-metal. The front axle is of H-section forged steel, and is of the dropped type. The steering wheels are 34 in. diameter, with 100 mm. tyres, those at the rear being 35 in. by 120 mm. The springs are of good length, and the usual four longitudinal ones are supplemented by a transverse spring at the rear. The steering gear is of a special worm and nut design, with provision for readily taking up any wear. The vehicle has a track of 4 ft. 7½ in., and a wheel base of 9 ft. 10 in., enabling any type of modern motor-car body to be fitted.

The new medium-power four-cylinder car—the 15-h.p.—will no doubt attract considerable notice, as well for its up-to-date lines as its relatively low price. While following in general arrangement the design adopted in the larger vehicle, the details show considerable variation, the engine and gear-box, for instance, being supported on a sub-frame of tubular steel construction. The engine is a small replica of the 25-h.p., except that long plain bearings are used in place of those of the ball type; the cylinder dimensions are 95 mm. bore by 115 mm. stroke, and the normal speed 1,000 revolutions per minute. A governor is provided, this acting on the throttle, which is also controlled by a lever on the steering wheel. The ignition is by coil and accumulators, the contact-maker being located on the upper end of

a vertical spindle driven by bevel gear off one of the cam shafts. The carburettor, which is of the automatic type, is gravity fed from an eight-gallon tank located under the front seats. The clutch is of the cone type, the leather face being of extra width than usual, permitting the drive to be taken up gradually and smoothly. The spring is connected with the gear-box by a shaft, provided with a joint to compensate for any want of alignment between the two parts. Three speeds and a reverse are provided, with direct drive on top speed to a well-supported live axle. The shafts in the gear-box run on long plain bearings, to which ring lubricators are fitted, while the road wheels are furnished with ball bearings. The front axle is of tubular construction; in other respects the vehicle, which has a wheel base of 8 ft. 6 in., is similar to the 25-h.p. vehicle.

Altogether the new cars mark a considerable advance, and, in view of the great care that has been taken in the choice of materials, added to the reputation for good workmanship enjoyed by the Redditch concern, the Enfield vehicles, for which Messrs. J. Keele and Co. have been appointed London and district agents, will no doubt be much heard of during the coming season.

MESSRS. A. C. WRIGHT AND CO., of the South London Motor Exchange, of 5 and 6, Lorrimore Buildings, Walworth, are making a special feature of repairs to motor vehicles. Arrangements are also made for repairs by contract.

## CONTINENTAL NOTES.

**Motor Postal Services in Algeria.**

The Algerian post and telegraph authorities, with the view of accelerating the transport of the mails between Boghari and Laghouat, are contemplating establishing a motor-car service between the first-named place and Sidi-Maklout. Unfortunately, the last twenty-five miles of the road to Laghouat are not fitted for automobile traffic, and for the present horses will still have to be used on this section.

**Public Services in Germany.**

A company has just been formed at Burgstadt to run a number of motor-buses between Mittweida, Burgstadt and Limbach. Two twelve-seated motor vehicles are about to be put in service in the town of Lensahn (Schleswig-Holstein). It is also proposed to establish a service between Baerl and Moers.

**An Automatic Engine-starting Competition.**

The second contest—the first having been held a year ago—for the prize offered through the Academie des Sports by M. Henry Deutsche de la Meurthe, for the best arrangement for

driving his 200-h.p. eight-cylinder Darracq, covered the distance in 25 sec., equal to ninety miles per hour. Mr. Cecil Edge, on his six-cylinder Napier, was second in the racing class in 29 sec., and Longchamps on a 100-h.p. Itala third, in 34 3-5 sec. In the light racing car section victory again went to the Darracq Co., Demogeot driving his machine, which was fitted with Continental tyres, over the kilometre in 29 sec.; Villemain on a Clement Bayard taking second place in 33 4-5 sec. There were a large number of entries in the touring car sections.

**Miscellaneous Items.**

About twenty entries have so far been received for the reliability trial of voiturettes which is to be held in France from the 5th to the 12th inst.—The German Daimler Company—the makers of the Mercedes cars—have recently patented a self-starting device for use in connection with petrol motors.—A public service of motor vehicles has lately been established between Pruniers and Barcelonnette, France. The vehicles in use are of the Orion type, and are of 22-h.p.—The 1,000 kilometre reliability trial of the Motorcycle Club de France has been postponed until the 18th, 19th, and 20th inst.—It is reported

The Gaillon Hill Climb.—Mr. Cecil Edge on the Napier Six-Cylinder Car.

the automatic starting of petrol engines, is to be held in December next, commencing on the 10th. The competition is international in character and entries will be received by the Technical Committee of the Automobile Club de France until December 5th. The apparatus must permit of the engine being started from the driver's seat, and trials will be made both with the motor cold and after it has been running some time.

**The 1907 Mercedes.**

The first of the 1907 Mercedes cars has just reached Paris. It is a 35-h.p. vehicle, in which a number of detail improvements have been introduced. The carburettor is of a new automatic design with hot water jackets. The throttle is controlled by both hand and foot levers. A fan is now placed behind the radiator; the water circulating pump is driven off one of the cam shafts, whilst the Hamelle lubricator is operated by means of a shaft instead of a chain.

**The Gaillon Hill Climb.**

The hill-climbing competition over the flying kilometre at Gaillon, on Sunday, organised by the "Auto," attracted considerable attention and some new times were put up. The honours of the day again fell to Mr. A. Lee Guinness, who,

that the Brasier Company have decided not to take part in any of the big races in 1907.—A company has just been formed in Brussels to introduce a service of motor-cabs in that city.—An Automobile Volunteer Corps has just been formed in Saxony.—About fifty entries have been received for the kilometre speed trials which are to be held at Origny St. Benoite, near St. Quentin, France, on Sunday next. The competitors in the racing car class include the 200-h.p. Darracq, an 100-h.p. Itala, a 90-h.p. Napier, and a Vulpes.—The Fetes Committee of Palermo, Italy, has tentatively fixed April 18th next for the annual voiturette competition, and April 21st for the Targa Florio race.

A MODEL of a chassis of a petrol motor-car has lately been added to the engineering collection at South Kensington Museum.

MR. WM. S. JESSOP, of Leeds, has recently brought out a simple and ingenious lever to facilitate the insertion of the valve stem and security bolts in rims during the operation of replacing an outer cover in position. We hope to illustrate it in an early issue.

THE King of Portugal has just ordered a 30-h.p. Brouhot car.

THE Grand Duke Eugen of Austria has placed an order for a 40-h.p. Fiat car.

SIR EDWARD TENNANT and Lady Brocklehurst have recently purchased Daimler cars.

MESSRS. BOURKE AND CO. have established themselves in the motor trade at 120, George Street, Limerick.

THE annual race meeting on the Ormond-Daytona Beach, Florida, is to be held from January 22nd to January 29th next.

MR. J. S. BROWN has a commodious garage in Oxford Street, Swansea, with every facility for the repair of motor-cars.

MR. C. HOODYDONK has taken over the agency for the Dependence rear lamps, electric head lights, side lights, and boat lamps, and is holding a large stock of these goods, also spare parts for same, at his depot, 6, Leather Lane, Holborn, London, E.C.

THE capital of West, Ltd., has just been doubled to cope with the demand for West cars, which are now being shipped to all parts of the globe, in particular to Italy, Canada, India, and Australia. The company intend to shortly open a branch establishment in Bombay, where a stock of vehicles designed to meet the requirements of the country will be on view.

WE illustrate herewith the new 24-30-h.p. Clyde car which has been recently put on the market by Mr. G. H. Wait, of Leicester. The engine is a four-cylinder Aster, the dimensions of the cylinders being 105 mm. bore by 140 mm. stroke. Two systems of high tension ignition—magneto and coil and accumulators—are fitted, and the mixture is furnished by one of the latest patterns of Longuemare carburetors. The clutch is of the metal-to-metal disc type. Special attention has been paid to the brakes, which are of the internal expanding metal-to-metal variety. Ball bearings are fitted to all parts with the exception of the engine. Long springs are employed, and the axles are of the Lemoine type.

A NEW motor fire appliance has just been put into service by the London Fire Brigade. The machine, which has been specially constructed to meet the requirements of Captain Hamilton, the chief officer, is of Merryweathers' latest type, and is fitted with a 30-h.p. four-cylinder motor. It comprises a hose tender and reel, carrying about 1,200 ft. of hose for use with street hydrants, a full set of gear, a telescopic ladder and a pair of hook ladders for life saving. The machine will carry eight men, can turn out instantly on an alarm, and maintain an average speed of twenty miles per hour.

REFERRING to the description of the Dorwald automatic petrol-paraffin carburettor in a recent issue of the *M.C.J.*, a feature of the apparatus, which was not shown in the illustrations, is the automatic valve closing the inlet to the disc chamber jacket, while an arrangement has been added for mechanically raising the fulcrumed lever, in order to close the paraffin nozzle and open the petrol one, in case of emergency. This arrangement is operated from the dashboard, and is intended for use when the engine has been standing for some considerable time, and the carburettor has cooled down to a temperature insufficient to vapourise the paraffin, although the automatic change-over chamber is sufficiently hot to keep the petrol jet closed.

## HERE AND THERE.

FROM J. E. Hutton, Ltd., we have received a book containing simple and useful instructions intended for private owners of Berliet cars.

A 40-H.P. DELAUNAY-BELLEVILLE CAR, with special

touring body, has lately been completed for the Grand Duke Alexander of Russia.

THE Automobile Club of America is organising a reliability trial of commercial motor vehicles to be held from the 7th to the 10th inst.

THE *Daily Mail* heads its daily record of motor-bus news "The Skidders"—a somewhat sensational and generally unnecessary way of expressing itself on the subject.

THE Parsons Non-Skid Company, Ltd., have received an order from the Metropolitan Fire Brigade for their non-skids for use on motor fire engines. These are for solid tyres of both the twin and single type.

IN addition to their 6-h.p. Starling car, the Star Cycle Company, Ltd., are bringing out a new 7-h.p. twin-cylinder model for the 1907 season. The vehicle, which will be known as the "Stuart," will be fitted with either a two, three, or four-seated body.

FROM 100, Regent Street, W., comes the new list of Aquascutum, Ltd., whose clothing for motorists is well known. The cloths have a good texture and delightful appearance, while the many valuable features introduced into their motoring designs should be seen by those who indulge in the pleasures of winter motoring.

THE endeavour to prevent the recent motor-car races at Blackpool by process of the Palatine Court of Chancery, which was unsuccessful, was followed by further proceedings at the sitting of the Court at Manchester before Vice-Chancellor Leigh-Clare last week. The publishers of local paper were fined £50, and costs for contempt of court by publishing part of the evidence to be used in

connection with an interlocutory motion before the deputy of the Chancellor, and also for making hostile comments against the persons bringing the action and persons who were giving evidence in connection with it.

THE Church Sisters' Home in King's Road, Chelsea, was the scene of an exciting incident on Wednesday of last week. As a motor fire engine, which was out on its first trial, was proceeding along the King's Road the wheels skidded on the greasy road, and before the brakes could be applied the vehicle crashed into the garden wall of the Home, carrying away seven or eight yards of it, and greatly startling the sisters and lady superintendent. The collision was so severe that all the firemen were flung from the engine, and one was shot over the wall of the garden, but fortunately all escaped without injury except for a few bruises.

AT the conference of the Scottish Chamber of Agriculture in Edinburgh a resolution was passed strongly disapproving of the recommendation of the Motor Car Commission to dispense with the present speed limit and adhering to former resolutions against the compulsory lighting of all slow-going vehicles. Earl Carrington said, as regarded the speed limit, he was not prepared to give an opinion. It was a matter which would have to be thrashed out in Parliament and the country. As to their objections to the lighting of slow-going vehicles, he reminded them of the accident to the Duke of Connaught in Scotland as an argument for lighting.

The Clyde 24-30-h.p. Car.

"FREE garage" is being given on the premises of the Warrington Motor Carriage Company, Ltd., of Sankey Street, Warrington.

MESSRS. SINGER AND CO., LTD., are, we learn, open to negotiate with a responsible firm for the agency for their new Singer cars in the London district.

A SAMSON non-skid was fitted to Mr. A. Lee Guinness's 200-h.p. Darracq when the new French record of 20 sec. for the flying kilometre was established at Dourdan on the 21st ult.

THE new motor-boat bye-laws on the Thames will shortly come into force. Those who wish to have a copy of these regulations sent to them should send in their names to the secretary of the Thames Conservancy, Victoria Embankment, E.C.

THE Prested Miners' Lamp Company have lately introduced a small accumulator testing lamp. The 4-volt lamp and connection is all self-contained in a plated metal case, which occupies but a very small space, and which can be easily applied to the terminals of the accumulator.

THE annual ploughing match of the Boston Agricultural Society was held on Mr. W. Dennis's farm at Wybérton. As is now usual at ploughing matches, there was a class for motor-ploughs, and the first prize was won by the Ivel agricultural motor, which was shown hauling a three-furrow plough, nine inches deep, as well as cultivating.

# CORRESPONDENCE

[Letters to the Editor should be addressed to the offices, 87-88, Charing Cross Road, W.C.]

## THE TAXATION OF CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you allow us, on behalf of the committee of medical men who are users of motor-cars, to call attention to a matter of importance? Under the existing Motor Car Act, which has been temporarily prolonged, the owners of motor-cars are called upon to pay (1) for a licence to drive; (2) a registration fee; (3) a carriage tax of £2 2s. for cars under one ton weight, and of £4 4s. for cars over a ton weight.

Now there are good reasons for anticipating that in the Act which is being drafted the last of these three will be materially increased, and that cars will be taxed according to either their weight or horsepower. In either case the new taxation will fall heavily upon medical men, who, owing to the exacting nature of their work, the requirements of reliability, the rough roads and steep hills they have to traverse, must use substantially-built cars with adequate horse-power.

It is not right that motors used by medical men in their daily work should be taxed as though they were the pleasure vehicles of the rich.

cheapness and efficiency of fuel be both secured and maintained, and the Motor Union, with this object in view, has resolved to thoroughly investigate the subject of fuel. The committee, therefore, invite assistance, and will be glad to receive, either verbally or in writing, the experiences and suggestions of all who are willing to aid them. Such evidence will, if so desired, be treated as confidential.—Yours truly,

W. REES JEFFREYS.

## SUNDAY MOTORING.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Although "W. T. W., A. 1299" writes very sensibly in his letter on the above subject, I cannot agree with him that motor-cars should be so made that they cannot exceed the speed limit.

There are places, and plenty of them, on our main roads where to crawl along at a speed of twenty miles per hour would be absurd; your correspondent must remember that there is a difference between the high speed and cautious motorist and the man (I will not call him a motorist) who will drive a car "neck or nothing" everywhere. It is possible for one driver to be perfectly safely placed in charge of a car capable of sixty miles per hour, whereas it is not safe to allow another driver to have a car in his hands capable of running up to the legal limit, let alone above it. What is required is that, before a man is allowed to have charge of a car, he shall be obliged to undergo a practical examination on the road, by a capable official, appointed by the Government, as is the case in France. A man confident in his

The Inaugural run of Barnett Motors Ltd.—A Fleet of Renault Cars at Tewkesbury. (See page 766).

The medical man has neither time nor money to allow of such luxuries; his motor-car has to be used strictly for professional purposes, and, in consideration of the enormous amount of gratuitous work that he does, ought to be exempt. Surely it is to the advantage of the public to encourage the use by medical men of a means of progression which enables them to render such speedy help in moments of emergency. It is, however, likely that heavy taxes will be thrown upon medical men, unless they bestir themselves, and try to defend their own interests.

We would, therefore, suggest that each medical man should forthwith write to his own member of Parliament, or to any others he may know, for protection and support. Those members of the public who are favourably disposed are asked to write to members of Parliament and express their sympathy with this movement.—Yours truly,

C. B. LOCKWOOD.

Chairman of Committee of Medical Men who are users of Motor-cars.

H. E. BRUCE PORTER.  
Hon. Secretary.

## FUEL FOR MOTOR-CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The Motor Union has appointed a special committee to consider and report on the subject of fuel for motor-cars.

Petrol of a specific gravity of .715 to .720, the fuel at present in general use, is an expensive necessity to the users of motors, and may possibly become even yet more expensive.

It is of advantage to all who are interested in motor traction that

capabilities would glory in the opportunity of showing his skill, and the person who objected to examination would be kept off the road, to the benefit of all other users.—Yours truly,

ALAN A. L. HICKMAN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been much interested by the correspondence in your columns re Sunday motoring, and, although not at all averse to it, I should like to make a complaint about a very serious breach of Sunday discipline. I refer to the blowing of horns in roads and streets in the vicinity of churches on Sunday. Unfortunately, it is such a very common occurrence that I am sure church-goers in nearly every part of the country will have experienced it, and I do not think that anything sounds so dreadful as to suddenly hear the loud blast of a horn in the middle of a service.

A remedy is not very hard to find; a very small amount of consideration on the part of the driver is necessary; he has only to slow down his pace to such an extent that to blow his horn is unnecessary, and he will thereby do a great deal for the cause of Sunday motoring.—Yours truly,

VERITAS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. T. Morison seems to be under the impression that everyone who motors must be rich. This may have been near the mark four or five years ago, but I do not think it applies to the present day, when second-hand cars of all sorts can be picked up at

a very reasonable price. There must be thousands like myself, possessed of small means, who can only do a little motoring on Sunday, whether it be by "bike," tri-car or small car. If these are driven with reasonable care they make no more dust than the poor man's bicycle, pony-cart, wagonette, to say nothing of beanfeasters' outings that one meets on the road.

Mr. Morison's remedy would simply bar all the poorer class of motorists, who can only enjoy it on a Sunday, while leaving it open to the very few rich who are at liberty all the week as well. I should like to suggest what I think would be a better plan of meeting the nuisance caused principally by cars of high horse-power, and that is for every car to be subjected to a thorough speed test by the licensing council, and for every mile a car was capable of doing over the legal to be charged at the rate of £1 per mile; a car geared to do 35 miles per hour would then pay £15 over and above the ordinary two guinea licence. If this were in force, I fancy we should soon hear less grumblings from the public.—Yours truly,

J. SIMMONS.

### RACING TRACKS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice the motor races or trials on the 12th inst. at Blackpool were postponed to the following day in consequence of the track being in a dangerous state and "skiddy" owing to the surface being greasy. It has always been a matter of surprise to me that it should be found necessary to go so far north for a good motor track when they have one so near London as Westcliff-on-Sea. This track is about two miles long and thirty yards wide, and, being laid with Taafalt, it is not only dustless but is proof against skidding or side-slip. I would suggest

The Turner-Miesse Steam Car recently completed for Mr. J. Withinshaw, of Cape Town.

that those interested, be they private owners or manufacturers, should inspect this magnificent road, which runs from Westcliff to Leigh-on-Sea. I hear that Dustroy, Limited, have been selected by the Roads Improvement Association to lay Taafalt on the Portsmouth road, so as to do away with the dust. The motor course being made by Mr. Locke King on his beautiful estate at Weybridge will be finished to enable the first race meeting to be held about May next, and the whole of this track, over three miles, will also be surfaced with Taafalt. Under the auspices of the Automobile Club it should prove a great success.—Yours truly,

CHARLES SUGDEN.

### A WARNING TO INCONSIDERATE DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On a recent Sunday afternoon I was (merely for amusement) timing cars returning from Brighton as they ascended the rise about a mile beyond Patcham. One car, of racing build, covered 130 yards in five seconds, or at a speed of over 53 m.p.h. Shortly afterwards two cyclists came down the hill, one shouting to the other as he passed, "I would puncture their tyres, then set the villagers on them and give them a good hiding! That is what they want." Comment is needless.—Yours truly,

L. C.

### CARS FOR INDIA.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—India as a market for automobiles is rapidly improving, and there seems to be a greater demand than ever for British-built vehicles affording ample horse-power at moderate prices. As manufacturers of motor-cars since 1898, we are securing a fair share of the trade, but our customers write to the effect that most makers send out standard vehicles, omitting to make provision for the climate affecting the woodwork or efficiency of the engine. The carburettor, whilst

generally eminently suitable for the English climate, hardly ever allows for the proper adjustment to insure getting satisfactory running of the engine. Also the water circulation appears to receive little attention. An Indian client at present in this country, who intends to take back a "West" touring car, insists on wire wheels being fitted, and suggests that all vehicles sent to India should be equipped in this manner. It would be interesting to hear the subject ventilated in the Press.—Yours truly,

WEST, LTD.

### A PECULIAR IGNITION TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a car of a well-known foreign make which is subject at times to a most mystifying irregularity in the operation of the engine. When the bonnet is down and the car is running along the road, every once in a while one of the cylinders will miss an explosion, just frequently enough so that it can be detected. In the stable with the bonnet up there is absolutely nothing wrong, and the engine runs perfectly, but the moment the bonnet is put down the missed explosion occurs occasionally. I have tested the carburettor, the ignition circuits, and everything else, but am totally unable to ascertain the trouble, and should be obliged if you or any readers of the *M.C.J.* could render me any assistance.—Yours truly,

W. RAMSBOTTOM.

[The cause of the trouble may be found in faulty contact in the contact breaker, especially if it is for four cylinders. When the engine is running and the car is stationary, there is not the same amount of vibration on certain parts, but when running on the road a contact breaker in which the contacts and the bearing of the rubber roller are worn is very likely to miss occasionally, and will miss more frequently as time goes on. Contact breakers which are much worn may also have a burr of metal which may be causing a short circuit at intervals. We have had a similar trouble which was entirely caused by this, and it was only detected by the heating caused by the faulty contact, which, created smoke, and located the trouble when the engine was running, and the contact breaker examined with the cover off.]

### AN ENGINE QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a Maxwell 8-h.p. two-cylinder car, and find that the two cylinders are not doing an equal amount of work. The sparking is all right, as also are the valves. I may say that I have had a new carburettor fitted, and, when the extra air inlet is closed the two cylinders seem to work equally. This I tested by retarding the spark and pressing down the trembler blades. Now, when I begin to let in the extra air one cylinder goes on working even better, but the other begins to slow up, and when the air inlet is half open it begins to misfire, and eventually stops altogether. I may say that the compression on this side is not so good, and I understand that it never has been since the car was built. Although I can attain a speed of thirty-eight miles per hour, I feel that could the poor cylinder be made as good as the other, I could then use more air and therefore economise fuel. I suggested a plate at the end of the piston, but my garage engineer, who has had a lot of experience, says that it would do harm. I don't know exactly why. If you agree with me, will you tell me what thickness this plate ought to be, and of what material it should be made?—Yours truly,

F. SUGDEN, M.B.

[The trouble referred to by our correspondent is no doubt due to loss of compression in one cylinder. It seems to us that this loss must be either by the piston or valves, as no doubt both cylinders are of the same capacity; therefore, if everything were sound, the compression ought to be obtained in both cylinders. We should not advise the fitting of a plate, as this would alter the balance of the engine, no doubt setting up excessive vibration. The loss may probably be found past the piston.]

### NON-SKID EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having used the Goodrich all-rubber non-skid for several months, I thought the following might be of interest to some motorists. They are fitted to both driving wheels of a two-seated 7½-h.p. steam car. The tyres have never been punctured. I have not touched the tyres nor had the slightest trace of slip, although the car was a very bad skidder previously. Now I have a 9-h.p. Serpollet of which only one wheel was fitted, and have only slid slightly on steep gradients in Gloucestershire in the region of Stone-on-the-Wold, where the roads are slimy to a degree. In my opinion, these non-skids wear very well and increase the life of tyres. Apparently they do not overheat, although the car is a fast one.—Yours truly,

PERCIVAL SQAMES.

### WHAT IS WARNING?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Cases of "failing to give warning" are being taken up in some parts of East Anglia by the police. I send a report of a case in which two witnesses for the prosecution swore positively that defendant blew his horn, in addition to an independent witness for

the defence and defendant himself. There was considerable division on the Bench, but, needless to say, defendant was eventually convicted. Your readers, like myself, would doubtless like to know how often one must blow one's horn? I fear that a worse nuisance than the dust fiend will shortly arise if these prosecutions multiply, viz., an automatic buzzer.—Yours truly,

E. B. 173.

[The case referred to was heard by the Borough Bench at Wisbech, where a motorist was summoned for not giving sufficient warning of his approach. As our correspondent remarks, the Bench fined the defendant (10s. and costs) although witnesses declared they had heard him blow the horn.]

### THE BIAS OF JUDGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The case reported in your columns by General Tucker shows a very gross miscarriage of justice. Were I in his position I would not accept the judge's decision, if there is an appeal and the facts as stated have been proved. I mention this qualification, as it is sometimes possible to make a statement of fact and not to be able to support it with the necessary amount of proof required by law, as in the case of opposition witnesses swearing to the contrary.

The "common law" applicable to the case is that each vehicle must allow the other the half of the road, and for the judge to say to the owner of the vehicle that occupied only 9 ft. of a 30 ft. road that he ought to have cleared the other vehicle which occupied 21 ft. of road is too preposterous to argue. It is difficult to understand why any judge could so stultify himself as in this case, but I fear that General Tucker has suffered on account of the gross culpability of other reckless drivers of motors who imagine that it is everybody's duty to get out of their way or take the consequences.

It is for General Tucker to consider whether it would be advisable to raise an action against the brewers for the damage done to his car, before some other judge, or appeal; but in any event the hardship of the situation is great and justice has been caricatured and scandalised.—Yours truly,

EVEN-HANDED JUSTICE.

### MOTORISTS AND THE POLICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—From the newspaper report of my case heard recently before the Reigate magistrates, when I was summoned for exceeding the speed limit, and more especially from the remarks made (in my enforced absence, as explained in my letter to the Bench) by the chairman, Mr. Jeremiah Coleman, one would gather that I had both deceived the police and misled the Bench. According to the newspaper reports which I have read, the constable who served the summons on me stated that I had given the wrong address. It is true that my new address (to which I have recently moved) was not at the time on my licence, but the police might have had the fairness to inform the Bench that I gave my card with my full name and correct present address to the constable who stopped me on the road, and that they should have had no difficulty in finding me. This can be borne out by a witness who was present at the occurrence. Further, my letter to the magistrates of October 11th did not contain any misleading statements, as attributed to me by Mr. Jeremiah Coleman in his lamentations from the Bench. On the contrary, I confessed my sins and tendered my most humble apologies and regrets. I have never yet condescended to any mean subterfuges such as is suggested by the report of this case, and I trust you will insert this letter in justice to myself.—Yours truly,

COLIN DEFRIES.

[We may point out that our report of the case did not contain the inaccuracies referred to, which, however, did appear in certain newspapers.]

### DIFFICULTY IN STARTING ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of June 30th last you published a letter from Mr. C. N. R. Wheatley complaining of the trouble in starting an 8-h.p. De Dion car, and I have waited until now to see if the De Dion Company would offer any explanation or give the reason why their single-cylinder cars are often so difficult to start. I have also carefully perused various publications issued by De Dion Bouton, Ltd., but cannot find any explanation of what I take to be the true reason of this difficulty, and as it is one of the most important points on their car, their silence on the subject is inexplicable. In the bottom of the spray chamber of the De Dion car carburettor is a small hole running downwards at an angle and coming out from the centre of the plug in the bottom of the carburettor. On to the bottom of which the nut screws which holds the carburettor together. The object of this hole is to drain off superfluous petrol or water which may condense off the indrawn air, and it also serves, if the carburettor floods, to relieve the flooding. Owing to the suction of the engine, air is drawn through this hole and with it particles of dust, which in many cases result in the hole being choked. When this happens any overflow of petrol lies in the bottom of the chamber, which results in the engine getting such a rich mixture that it will not explode.

As most motorists flood the carburettor before starting, and if there is any difficulty in starting they proceed to flood the carburettor again, it will at once be seen that with this hole choked the trouble gets worse the more one tries to start by flooding the carburettor. I have been three-quarters of an hour starting my car, and it was only after some weeks that I found the cause, and then had to use a fine drill to open the hole, as it was so firmly choked. Since then the engine starts without any trouble, although for several weeks I had no end of bother. I have not the slightest doubt that this was the trouble, not only with Mr. Wheatley but with many others who have had difficulty in starting their single-cylinder De Dions.—Yours truly,

C. M.

### THE INFLATION OF TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the necessity of having tyres pumped up to a sufficiently high pressure in order that one's tyre bills may be kept as low as possible, might I suggest to the various tyre manufacturers that following the size of the tyre or the name of the maker should be a distinct impression on every tyre showing the minimum pressure at which this will satisfactorily run?

Thus continually impressing upon the owner, chauffeur, and garage

The Armoured Mercedes Car used in the recent Military Manœuvres in Austria.

proprietor the fact that his tyres should be pumped up to a certain pressure would surely have a good effect.—Yours truly,

INFLATOR.

### MASCOTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much interested and amused at Mr. C. M. Holloway's account of his cat's ride with him on his car. I am a motorist myself and a great lover of cats, and I would just like to remind Mr. Holloway how susceptible cats are to cold and liable to pneumonia, so that it would not be advisable to take his dear "Tommy" on very cold days, as he might catch his death cold through it.—Yours truly,

A. G.

TYRE PUNCTURE.—"J. T.," of Castletown, Isle of Man, asks for the experience of readers in mending punctures with vulcanising solutions, and would like to know the effect on the rubber.

A TAIL LAMP was found in Sible Hedingham on Saturday, October 21st. It is a large brass one, and will be returned to the owner on applying to Mr. M. Gentry, Sible Hedingham, Essex.

TOURIST TROPHY RACE.—*Métallurgique Cars* write:—"We notice that Captain Deasy thinks we have overlooked the requirements of a large section of the public in the way of touring cars. We would, therefore, like to point out that these are the very people we cater most for, as we have built up to now only touring cars. We fit even on our smallest four-cylinder chassis 16-20-h.p. spacious double landaulet-limousines, with seating capacity for six people. This chassis is naturally lighter than our 24-28-h.p. which we entered for the Tourist Trophy. The latter is much stronger, and we would therefore not hesitate to fit any type of heavy limousine to it."

## THE TOWN CARRIAGE COMPETITION.

THE judges, Messrs. F. E. Dyke Acland, W. Worby Beaumont, C. Vernon Boys, T. H. Cochrane, E. H. Cozens-Hardy, R. E. B. Crompton, H. S. Hele-Shaw, A. G. New, Wilson Noble, Sir David L. Salomons and Robert Todd, in this competition, reports of which have already appeared in our columns, have recommended that the following medals be awarded:—

CLASS "A," for vehicles costing up to £600 complete.

Gold medal to Mr. Carl Oppermann, for his electrical vehicle No. 31, and

A gold medal to the Wolseley Tool and Motor Car Company, Ltd., for its limousine car, No. 27.

A silver medal to the City and Suburban Cab Company, Ltd., for its public service vehicle, No. 26, and

A silver medal to the Adams Manufacturing Company, Ltd., Car No. 32, for ease of manoeuvring.

In CLASS "B," for vehicles costing over £600 complete.

A gold medal to the Electromobile Company, Ltd., for electrically-propelled vehicles, Nos. 7, 8, 9, 10, and

A gold medal to Mr. Frederic Coleman for his "White" steam cars, Nos. 1 and 2.

A silver medal to the London Motor Garage, Ltd., for a "C. G. V." car, No. 13; with an additional silver medal to the same company for excellence in carriage work.

A silver medal to the Krieger Electric Carriage Syndicate, Ltd., for its electrical vehicles, Nos. 17 and 18.

A silver medal to Messrs. Dennis Brothers, Ltd., car No. 14, for comfort to passengers.

A silver medal to the Pilgrims Way Motor Company, Ltd., car No. 12, for originality in design and accessibility.

We give in tabulated form the order of merit under each of the fourteen heads which were taken into consideration in arriving at the awards. These were lettered A—O, the points being as follows, and the letters corresponding with those that appear at the top of each column.

- A.—General design of complete car (chassis and body).
- B.—General appearance and finish of body work.
- C.—Absence of smell and smoke; proper direction of exhaust vent.
- D.—Absence of leakage of lubricant.
- E.—Absence of noise with car stationary or running.
- F.—Absence of vibration with car stationary or running.

## THE ORDER OF MERIT ON EACH OF THE FOURTEEN POINTS TAKEN INTO CONSIDERATION.

## CLASS A.—FOR VEHICLES COSTING UP TO £600 COMPLETE.

G.—Smoothness of running and comfort of passengers. An examination was made as to the use of [adequate tyres, size of wheels, spring suspension, and means of preventing road shocks.

H.—Ease of cleaning (a) exposed metal work and coach work, and (b) machinery (including oiling).

J.—Ease of access for repair, removal of body, access to important working parts, access to tools, to lubricating holes and stauffers, &c., removal of undershields, access to concealed gear).

K.—Ease of starting (a) cold (b) after recent use, with relation to smooth action of clutch (if any) and to smooth acceleration.

L.—Ease of stopping and speed changing without jerks or noise. An examination of the brakes was made both as to their efficiency and design.

M.—Ease of manoeuvring.

N.—Comfort of passengers in relation to cushions, folding seats (if any), &c., number of passengers carried exclusive of driver, access to interior by side entrance, exclusion of rain, storage space for tools and parts.

O.—Comfort of driver in relation to easy manipulation, shelter from wind and rain, ease of signalling to other vehicles (without special mechanical devices being required for this latter purpose).

Each of the above has been considered as a separate competition, and the order of merit in each is appended. Where duplicate numbers are given the merit is equal.

## NEW COMPANIES REGISTERED.

BOULT, TAYLOR AND COMPANY, LTD., has been registered with a capital of £10,000 to carry on the business of automobile garage keepers, &c. Their offices are at 12, Upper St. Martin's Lane, W.C.

NOTTINGHAM MOTORS.—Capital, £1,000. As title. No initial public issue. Registered without articles.

CITY GARAGE.—Capital £4,000. To take over the business of garage proprietors carried on by Mr. H. F. Borman, of Erdington, near Birmingham, and Mr. C. B. Borman, of Gloucester, as the City Garage. No initial public issue. First directors, H. F. Borman and C. B. Borman, 36, Worcester Street, Gloucester.

KEMPSHALL TYRE COMPANY OF EUROPE.—Capital £4 5,000. To adopt an agreement with Mr. E. Kempshall for the acquisition of certain patents and rights relating to improvements in motor and other tyres. Mr. E. Kempshall is a permanent director, subject to holding 20,000 shares. 182, Queen Street, E.C.

## STEEL FOR MOTOR-CAR CONSTRUCTION.

THE motor-car has been brought to its present state of perfection by the unremitting attention to the numerous details of its mechanism: the engines, the ignition, the gearing and the design of the body have all been, and are, the objects on which the brains of a numberless band of experts are concentrated. But there is one question which certainly deserves more consideration than it at present receives, and that is the quality of steel used for such important parts as the crank shafts, driving shafts, and axles. Apparently, there is a general impression that steel is steel, and that there remains absolutely nothing more to be said about it. And if the weight of the car were of no moment, perhaps it would not be necessary to say much more on the subject; but as it appears to be of vital importance that the weight should be cut down to the last pound, then the question of the steel used for the working parts merits the most serious attention of the motor engineer.

The motoring public, whilst displaying a nice discrimination in such matters as sparking-plugs, tyres, and carburettors, are compelled to rely entirely on the reputation of the maker; and in the event of an accident caused by the breaking of an axle or shaft, this reputation suffers in proportion to the publicity the mishap obtains. It is quite true that the steel question is now the subject of a little more interest than was formerly the case, as may be seen from the number of specifications in which certain classes of steel, such as nickel or nickel-chrome, are asked for; and frequently even a physical test is stated. But in how many instances is the analysis checked or the test verified at the motor works? And yet it would appear to have a certain amount of importance as to whether an axle is made of a special steel having a breaking strain of 45 tons per square inch, or of an ordinary mild forging steel with

It will be seen that the elastic limit, an important item, is increased proportionately even more than the ultimate tensile strength, and, taken in conjunction with the elongation, speaks well for the toughness of the material. Nor does steel containing the lower percentages of nickel present any difficulties in machining, and as we are only dealing here with the material employed in motor-vehicle construction, it is not necessary to enter into any of the peculiarities of, say, 15 per cent. to 30 per cent. nickel steel.

Another steel which is remarkable for its tenacity is one containing both nickel and chrome, the demand for which is to some extent limited owing to its somewhat expensive nature. The results of the physical tests vary according to the proportionate percentages of these alloys present, but the following may be taken as a typical test:—

	Elastic Limit.	Ultimate Tensile Strength.	Elongation.	Reduction of Area.
Nickel-Chrome Steel	41.6 tons per sq. inch.	58.0 tons per sq. inch.	23 % in 2 in.	49.0 %

As must naturally be the case with a steel of this high tensile strength, the machining, of course, involves a little extra trouble, but the material is obviously suitable in an admirable degree for parts subjected to strains. This steel has also been used for gears to run without case-hardening, but it is the opinion of a good many that the steel has yet to be made which will beat one made specially for case-hardening, provided that the casing be carried out in a systematic manner.

A group of Siddeley Cars at the Southern Motor Club's recent Gymkhana at Cheam.

a breaking point of only 30 tons per square inch. Probably in the early days of the motor-car industry the English steel manufacturers were a little behind their rivals across the Channel in realising the scope there was for special steels, but such is not the case now. Owing to the expensive nature of the alloys used in the production of high-tensile steels, which has made a very formidable matter of the almost innumerable but necessary experiments, together with the rather elaborate testing plant which is essential, it is only at several of the largest steel works where it has been possible to conduct the investigations necessary for the production of these steels. One firm which appears to have specialised to a very large extent in steel for motor-car construction is Wm. Jessop and Sons, Ltd., of Sheffield, who have permitted us to make use of the following tests.

From a practical point of view the most suitable steel for parts of the car subject to shocks is a material containing nickel, which is usually present to the extent of from 3 to 5 per cent., and the addition of which has a marvellous effect upon the strength of the metal. For purposes of comparison we give three tests which show, beyond question, the superiority of nickel steel:—

	Elastic Limit.	Ultimate Tensile Strength.	Elongation.	Reduction of Area.
Mild Forging Steel ...	16.2 tons per sq. inch	32.8 tons per sq. inch.	30 % in 2 in.	45.4 %
3 % Nickel Steel ...	32.8 tons per sq. inch	47.6 tons per sq. inch.	23 % in 2 in.	37.8 %
5 % Nickel Steel ...	38.2 tons per sq. inch	50.4 tons per sq. inch.	21 % in 2 in.	37.8 %

Although up to the present nickel and nickel-chrome steels have proved to be, for practical purposes, the best steels for the parts mentioned, Messrs. Jessops are still experimenting with a view to "going one better," and one of their latest steels has given a test which only a short time ago would have been considered an absolute impossibility. The following test was obtained from a  $\frac{1}{2}$  in. diameter rolled bar, without treatment of any nature:—

Elastic Limit.	Ultimate Tensile Strength.	Elongation.	Reduction of Area.
31 tons per sq. inch.	53.0 tons per sq. inch.	70.0 in 2 in.	54.2 %

Whether this material will come within the range of practical politics remains to be seen, but recent experiments tend to show that even more may be done to increase the strength of these special steels, and with this belief the steel manufacturers are sparing no effort or expense, and what is now wanted is the co-operation of the motor-car makers.

## POLICE TRAPS.

THE police are exercising a sharp surveillance over the stretch of road between Nottingham and Bingham.

THE Staffordshire police are now in possession of an electrical timing apparatus.

THERE is a measured distance on the Findon main road, Worthing. The police trap in the Shooter's Hill Road, London, S.E., has been in active operation.

## CLUBS AND ASSOCIATIONS.

### THE INSTITUTION OF AUTOMOBILE ENGINEERS.

THE first meeting of the Institution of Automobile Engineers will be held at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, London, S.W., on Wednesday next, at 8 p.m. A short introductory address will be given by the president, Colonel R. E. Crompton, C.B., R.E., on the work and objects of the Institution, which will be followed by a paper on "Fuel," by Professor W. A. Bone, D.Sc., F.R.S., of Leeds.

### BRIGHTON MOTOR CYCLISTS.

THE motor section of the Brighton Cyclists' Club was formed in 1904, and has done a considerable amount of useful work in an unobtrusive way. To quote a single point of local interest, the reduction of the heavy toll formerly levied on motor-cyclists at the Shoreham "railway" bridge

Touring in France.—The Hotel de Ville, Lyons.

was a concession made by the L.B. and S.C.R. authorities as a result of representations made by this club, which is affiliated to the Auto-Cycle Club and the Motor Union. The club house has a billiard-room, reading-room, refreshment-bar, &c., at 190, King's Road Arches.

### BRITISH MOTOR BOAT CLUB.

THE annual dinner of the club will be held early in December, when the commodore, Admiral Sir W. Kennedy, K.C.B., will preside at the banquet.

### MARINE MOTOR ASSOCIATION.

THE general meeting of the members of the Marine Motor Association was held on the 25th ult. at the Golden Cross Hotel, London. Mr. H. W. Hutchinson presided, and the members present included Messrs. Linton Hope, Seaton Edge, Perman, A. Harden, T. Thornycroft, F. S. Bircham, and J. A. Smith. It was reported that the association was in a very flourishing condition. The past season had been the most successful in its history. Altogether over eighty motor-boat races had been held under the rules of the association during the past year, as against fourteen in the previous twelve months. It was also reported that the membership was daily increasing, there being now close upon 100 names on the book. A number of new rules and alterations to those already in existence were passed.

### AUSTRALIA.

IN the recent run of the Automobile Club of New South Wales, Messrs. Innes' and Morgan's Humber car greatly distinguished itself.

The Automobile Club of Victoria has had a successful hill climb at Heidelberg, where they had a hill 1,050 yards in length with a gradient of one in six and a half. There were forty-three entrants, and over 100 automobiles were lined up at the finishing point, constituting the most imposing array of motor-cars yet seen in the colony.

The times showed a marked improvement on previous runs up this hill. Mr. David Thompson (16-20-h.p. Humber), who carried off the speed honours by the small margin of a second from Sir Reginald Talbot's (12-16-h.p. Talbot) car, averaged a speed of nearly twenty-two miles an hour up the hill from a standing start. A private match was then run off between Mr. S. Dalrymple (12-16-h.p. Talbot) and Mr. H. Howard-Smith (12-16-h.p. Talbot), Mr. Dalrymple winning an exciting race by fifteen yards in the fast time of 1 min. 40.3-5 sec.

The official awards on the handicapping formulæ were as follows:—

#### MULTI-CYLINDER CARS.

1st, W. C. Knight (10-h.p. De Dion); 2nd, Sir Reginald Talbot (12-16-h.p. Talbot); 3rd, F. L. Klingender (8-10-h.p. Humber).

#### SINGLE-CYLINDER CARS.

1st, Dr. R. E. Weigall (6-h.p. De Dion); 2nd, A. G. Hampton (6-h.p. De Dion); 3rd, F. E. Fay (6-h.p. De Dion).

THE balance of the funds of the late Warwickshire A.C. has been handed to the Motor Union.

THE Montreal (Quebec) Automobile Club has held the first motor gymkhana in the province.

THE Derby and District A.C. intends to invite the Motor Union to hold a provincial meeting in the county next year.

SIR HUGH BELL, Bart., J.P., and Mr. R. Armitage, M.P., will be among the guests at the annual dinner of the Yorkshire A.C. on the 14th prox.

ON the occasion of the Manchester Motor Club's 100 miles reliability trial, six non-stop runs were made, of which three were to the credit of Humber cars.

THE Cumberland Motor Union and the North Berks Automobile Club have been admitted to membership of the Motor Union. The clubs now included in the latter number 80, and the aggregate membership is 13,800.

### CRYSTAL PALACE AUTOMOBILE CLUB.

THE open hill climb of the Crystal Palace Automobile Club on Captain Kidd's Hill, at Hartfield, near East Grinstead, was illustrated in our columns last week. The calculations of the judges and timekeepers have resulted in the following order being assigned, based on formula:—

Car.	Cubic Capacity.	Weight.	Speed.	Marks.
1. 9-h.p. Riley ...	63	1414	79.1	100
2. 12-16-h.p. Clement-Talbot ...	166	2702	100	91.6
3. 5-h.p. De Dion ...	43	1566	37	75.6
4. 12-h.p. De Dion ...	105	3164	43.9	74.6
5. 12-16-h.p. Clement-Talbot ...	166	3024	72.7	74.5
6. 6-h.p. De Dion ...	56	1876	40.4	73.8
7. 12-16-h.p. Clement-Talbot ...	166	3248	65.4	72.1
8. 15-h.p. De Dion ...	155	3612	49.0	64.3
9. 14-20-h.p. Unic ...	145	2352	66.5	63.2
10. 12-14-h.p. Regal ...	148	2562	50	48.5
11. 12-15-h.p. Arrol-Johnston ...	184	3206	41.2	47.2
12. 17-20-h.p. Scout ...	179	3024	48.5	46.0
13. 12-h.p. Darracq ...	144	2352	49.6	45.6
14. 15-h.p. Ford ...	134	1484	72.1	45.0

#### CLASS B.

## CASES UNDER THE MOTOR-CAR ACT.

### SECTION 1.—RECKLESS DRIVING.

STEPHEN FREDERICK JOHNSON, motor-car driver, of The Elms, Hampstead Heath, was summoned at the North London Police Court for driving in a manner dangerous to the public, and to give warning by bell or horn of his approach. The evidence was that at eight o'clock on the night of the 3rd ult. defendant drove down the Seven Sisters Road and tried to pass between a tramcar and a pony-cart. He struck both vehicles with great violence, and knocked the pony and driver through a shop window. The driver was severely hurt, and another man who happened to be in the way was also seriously injured, and was still in hospital. The driver and conductor of the tramcar declared that the defendant sounded no alarm, and dashed into the car and the cart. Defendant and a witness named Leach said the motor-car was not going faster than six miles an hour, and the accident would not have happened had not the pony swerved towards the centre of the road. Mr. Cluer fined defendant £5 and 10s. costs on one summons, and 40s. and 2s. on the other, or a month's imprisonment.

At Kingston Court on Thursday of last week six motorists were fined in sums ranging from £5 to £10 each.

At the Derby Borough Police Court, Arthur Hellaby, of Aston-on-Trent, was summoned for driving a motor-car at a pace dangerous to the public in the Corn Market, Derby, on October 6th. Mr. R. S. Clifford defended. The evidence was to the effect that the car was travelling at a speed of fourteen to fifteen miles an hour, and that as it turned round into St. James's Street it nearly ran over a man named Robinson. Witnesses were called, and as the evidence was contradictory the Bench dismissed the summons. They, however, fined defendant £1 and costs for driving without a licence, it being understood that the defendant's licence expired in March, 1905, and he had not taken one out since.

### SECTION 2.—IDENTIFICATION PLATES.

At the Leeds Police Court the Yorkshire Mutual Garage Company, Woodhouse Lane, have been summoned for a breach of the Motor Car Act. Recently they sold a motor-car, bearing their registered number, to a gentleman, who afterwards had the car registered a different number, but failed to return the old registration plate. His manager found the plate lying about the works, and, fixing it to another car, drove it out. For this offence he was last week fined, and a prosecution was now brought against the company. After legal argument the charge was withdrawn on an undertaking being given by the company that they would in future retain possession of their identification plates.

### SECTIONS 1 AND 9.—RECKLESS DRIVING AND SPEED LIMIT.

George Butcher, chauffeur, in the employ of Mr. A. W. Foster, of Brockhampton Court, near Ross, was summoned by P.C. Jones for driving a motor-car in Commercial Road, Hereford, on September 10th last, recklessly, having regard to all the circumstances of the case. A second summons had also been issued against him for driving a motor-car in Commercial Road on the same day at a speed exceeding twenty miles an hour. Mr. W. J. Boycott appeared for the prosecution, and Mr. Arthur J. Corner, solicitor, Hereford, for the defence. On the case being called on Mr. Corner raised a technical objection to the validity of the second summons, which was a charge of contravening the speed limit. He pointed out that the summons for reckless driving was issued on September 12th, that the summons for exceeding the speed limit was issued on September 15th, and that the notice of the intended prosecution in respect of that charge was also dated and had been served on the defendant on the 15th September. He said that as a matter of fact the summons for a breach of Section 9 of the Motor Car Act, 1903 (excessive speed) had been issued before the notice, as required by the Act, of an intended prosecution had been handed by the police to the defendant. The notice could not therefore be a notice of an intended prosecution, as the prosecution had already been commenced at the time of the service of the notice, and the prosecution could not be an "intended" prosecution.

Mr. Corner submitted that the summons was bad. Mr. Boycott in reply admitted that the summons had been issued before the service of the notice, but it had not been served until after the notice was given, and that the summons was therefore good. The Bench upheld Mr. Corner's objection and agreed that the second summons must fall to the ground. The case of alleged reckless driving was then proceeded with, and after hearing evidence that too was dismissed.

### SECTION 9.—THE SPEED LIMIT.

On behalf of the chauffeur of Mr. A. N. Hornby, who was charged at Nantwich with driving a motor-car at sixty miles an hour, and against whom the police withdrew the summons, a solicitor has obtained costs from the authorities. The chief constable said that, having found that the car was only 10-h.p., they realised that a mistake had been made.

Declaring that they were determined to check the excessive speed of motor-cars on highways, the Hove magistrates have imposed a fine of £10 and costs on Mr. E. M. Penn, of Banbury, for driving a car along the London main road at an estimated speed of thirty miles an hour.

A chauffeur named Bauche was fined for motoring along the same road at twenty-eight miles an hour.

At Worthing Petty Sessions, Edwin C. Pare, Upper Addiscombe Road, Croydon, was summoned for driving a motor-bicycle at a speed beyond the legal limit, on the Findon main road, on Sunday, September 30th. There was a second summons against defendant for failing to stop at the request of the police. P.S. Payne and P.C.s Slade and Tickner gave evidence. It was stated that when P.C. Tickner held up his arm, defendant appeared to be about to stop, but increased the speed, and went on. The policeman blew his whistle, but defendant only looked round and did not stop. Frank Chinn, an inspector of the Metropolitan Police, stationed in Croydon borough, produced proof of registration. He further stated that, upon the receipt of a letter from Superintendent Bridger, he interviewed defendant, who admitted riding the machine "BY 519," on the date named, from Croydon to Littlehampton, *viz* Horsham. He said, however, that he could not remember passing Findon, or seeing the constable hold up his arm for him to stop. Defendant was fined £2 and 19s. 4d. costs for the first offence, and £3 and 19s. 4d. costs for the second.

On one day last week six motorists were fined £5 and costs at the Penkridge Police Court for exceeding the speed limit at Weston-Lizard.

### APPEAL DISMISSED.

At the Reading Quarter Sessions the Recorder has given judgment in the case reported last week in which George J. Fawdrey, chauffeur, of Kingston Bagpuize, appealed against a conviction of the Reading

The 16-h.p. De Dietrich Landulet recently supplied by Messrs. Jarrott and Letts, Ltd., to Mrs. Charles Waterlow, Stanmore.

Borough Justices for driving a motor-car at a dangerous speed in Broad Street on July 21st. He said the appeal must be dismissed with costs.

### MOTOR-BUS REGULATIONS.

LORD MONTAGU of Beaulieu presided on Tuesday at the opening meeting of the second session of the Society of Motor Omnibus Engineers, held at the Hotel Cecil, London. He had thought the new regulations with regard to motor-buses might, on the whole, be accepted, but he hoped the County Council would not be entrusted with the duty of carrying them out. It was a most unsuitable body for the purpose and had quite enough to do as it was. He hoped the Government would appoint an independent board.

Mr. Douglas Mackenzie read a paper in which he expressed the opinion that the police were justified in the precautions they took to ensure that the brakes should receive proper attention, but they were sometimes unduly harsh in their issue of "stop" notices. As a case in point, an inspector entered a garage at six o'clock in the morning and proceeded to try the brakes of all the omnibuses that were not yet out. Naturally, as these buses were timed to start late, they were the last to be dealt with by the fitters, and the brakes had not been then adjusted on all of them, although they would have had proper attention before starting time. The inspector stopped five of these, and they could not be put into service until they had been passed later in the morning, several hours being wasted in each case. That was a typical instance in which the principles actuating the police were in every way admirable, but in which the application was unnecessarily vexatious. With

regard to the new regulation requiring a bridle round the cardan shaft, the lecturer said it was an open secret that it arose through a historic fatal accident, in which the bottom shaft fell out of the gear-box, taking the pedal brake drum with it, and leaving the front end of the cardan shaft loose to swing round, as it did to the destruction of the hand brake. Three very similar accidents had happened with other vehicles of the same make, but it was not easy to see how any bridle could be a real security unless it encircled the cardan shaft so closely as to involve the risk of contact. It would surely be better, he said, to make the long propeller shaft in two halves, to carry the forward half on two ball bearings, and to fix the other half with two long cardan joints. A plain "Oldham coupling" would then be the best connection between the gear-box shaft and the supported forward half of the propeller shaft. This regulation might be interpreted reasonably, and be no hardship, but where the cardan shaft was only as foot or two in length, such a bridle was quite unnecessary. In reference to the necessity for distinguishing the various routes by name boards and colours, Mr. Mackenzie suggested that the Commissioner of Police should appoint a committee of omnibus users, not professional policemen or omnibus owners, but those who had to find their way about London by omnibus, and that committee should decide the colour of the panel, the style of lettering, and the actual places to be written on every omnibus. Those companies which wanted their omnibuses to be interchangeable from route to route could easily adopt "false" panels, fitting into guides at both ends. The companies could then exhibit their fancy names on the board—under the eaves if they still desired to do so. The police had laid down definite rules as to body and seat dimensions, but by adhering to them too rigidly they were perpetuating a particular type and strangling all attempts to improve it. So with regard to the proportion between the number of passengers inside and outside, improved conditions were hindered by the bogey of top weight. Another detail in which the police had been unnecessarily restrictive was that of wheel track, they having refused to license all vehicles the front wheels of which did not track exactly with the back ones.

### MOTOR-CAR ACCIDENTS.

As a powerful motor-car, belonging to Sir Thomas Lipton, was approaching Coventry from London, it swerved and turned completely over, and the five occupants were pitched into the road. The driver escaped with a severe shaking, but Mr. F. Mulholland, of Ferryhead Street, Fulham, London, who was on the driving-seat, was killed. The three occupants of the body of the car were strolling players who had begged for a ride when about ten miles from Coventry. One of these had his arm smashed, and the others were badly injured, one succumbing to his injuries the following morning.

THE North Warwickshire coroner was engaged for nearly five hours on Saturday in inquiring into the cause of death of the two men. An engineer employed at the sewage pumping-station, within 250 yards of the accident stated that the car passed him at the rate of between thirty and forty miles an hour. The driver said he was going about eighteen miles an hour when he passed a millers' wagon. Immediately he got clear of this vehicle he got into a muddy road, the car swerved to the left, and, coming in contact with the grass at the side, swerved to the right and went over turrel-fashion. A motor expert, who examined the car and the ground, said the accident must have been due to skidding, and was just as likely to have occurred in the conditions which prevailed at the spot if the pace had been only ten miles an hour. The jury decided that the occurrence was accidental, and that no blame attached to the driver.

WHILE Lieutenant Paton, Northumberland Fusiliers, was on his way to Aldershot by motor-car, he ran into a cyclist named Osborne Hart, at Chobham, and caused his death. At the inquest, Inspector Jannaway stated that he had measured the distances, and found that Hart was picked up 203 ft. from the scene of the accident, while the car travelled 572 ft. before it could be stopped, although the driver said he had both brakes on. Lieutenant Paton said that the car might have been going at thirty miles. It was possible to tell when a car was going at ten miles, but impossible to tell when it was twenty or thirty miles an hour. He admitted that his was a 40-h.p. car, and could easily do forty miles an hour.

### PUBLIC MOTOR SERVICES.

THE system of horse-haulage for the tramways in the Gilmore Place district of Edinburgh is still in force, but that district is now about to be served by the Scottish Motor Traction Company, who are running motor-omnibuses to Corstorphine, Cramond, and the Forth Bridge. A fifteen minutes' motor service is being arranged for this route. It is over this route that the tramway company and the corporation have disagreed as to the method of traction to be employed in the future. In about a month's time the motor company expect to maintain a five minutes service from Tollcross to Craiglockhart Station, and consequently the equipment of the motor company is being increased. A motor-omnibus has been started on the service to Loanhead.

A MOTOR-OMNIBUS accident occurred on Waterloo Bridge, London, on Tuesday afternoon. A steam motor-omnibus, crowded with passengers, proceeding over the bridge from Waterloo Station towards the Strand,

in attempting to pass another vehicle, skidded and ran upon the pavement on the Westminster side of the bridge, and struck the parapet of the bridge with considerable force. Several pillars of the parapet were dislodged and fell into the river below, and the omnibus itself was only brought to a standstill by striking the large blocks of masonry immediately above the foundation of the archways, the blocks being displaced.

THE Edinburgh and District Motor-bus Company, Ltd., have started a service of motor-buses between the General Post Office and Murrayfield.

THE Chester Town Council have resolved that three motor-buses be procured at an estimated cost of £3,000, to serve the routes from Market Square to the Bache, and to Canal Bridge, Cheyney Road via Canal Street and Raymond Street.

"THIS action," said counsel, addressing a jury at the Brompton County Court on the 19th ult., "is brought by Sir Thomas Hewitt as a matter of principle and in the interest of the public. On the 24th of April a motor-bus belonging to the London Road Car Company had a side-slip in Fulham Road and came into collision with one of plaintiff's motor-cars which was on the pavement just about to enter the garage, and we are making a claim in respect of the damage done. But the London Road Car Company, by fighting the claim, say that they are perfectly entitled to run into anybody's car. They do not put it in that crude way, but they say we cannot help our buses skidding. We do our best, but if they skid and knock anybody down so much the worse for that somebody. Quite apart from the question of negligence, it is the contention of the plaintiff that a huge engine of destruction like the motor-omnibus, which is admittedly uncontrollable in certain circumstances, constitutes a nuisance on the public highway." For the defence it was contended that the road was very greasy and side-slip could not have been avoided. The Judge asked the jury if they considered the motor-omnibus a nuisance on the highway. If they did, they should award plaintiff damages. Nowadays the side-slip was set up in defence in many cases where careful driving would have avoided it, but in the present case it appeared such was not the case. The jury awarded plaintiff £5 damages. Judge Selfe: "On what ground do you find that verdict—that the omnibus was a nuisance? The foreman: That the vehicle was not under control, but we say the driver was not negligent."

THE suggestion has been made that a motor-car service should be established between Sligo and Ballina.

THE Aberdeen District Committee of the County Council have intimated a claim against the Great North of Scotland Railway Company of £121 7s. 6d. for extraordinary expenses incurred in maintaining a certain road over which the company motor-bus traffic to Culter passes. The company do not admit liability.

THE South Shields Town Council has been informed that the North-Eastern Railway Company will start a motor-bus service on December 1. The buses will run every twenty minutes from South Shields Railway Station to Cleadon and Whitburn, five miles distant. The Railway Company state that the fares will be fixed so as not to compete with the South Shields trams plying within the borough.

A MOTOR-OMNIBUS service is to be inaugurated between Malvern and Gloucester.

THE report of the directors of Humber, Ltd., for the year ended August 31st, states that, after making due allowance for debts, depreciation, and managing director's commission, a net profit of £106,558 appears, making with the sums brought forward an available balance of £108,930. The directors, after providing the dividend on the preference shares for the three years ended August 31st, recommend the payment of a dividend of 5 per cent. on the ordinary shares, placing £40,000 to reserve, and carrying forward £11,430. To meet the demand for cars a large expenditure has been incurred in the purchase of additional machinery and in extending the works. A large factory at Coventry has also been taken on a short lease, and a suitable site has been acquired with a view to the erection of new works.

THE report for the year ended September 30th, of the Daimler Motor Company (1904), Ltd., states that the profit, after provision has been made for interest on debenture stock, depreciations, etc., amounts to £213,469. There are bonuses to be deducted to employees, and the balance from last year to be brought forward, so that there is £227,050 for disposal. An interim dividend on the preference shares has been paid, and it is now proposed to form a special fund for renewal of plant and machinery, and for experimental and development work; to pay the balance on the preference shares; to pay 6 per cent. dividend on certain of the ordinary shares; and in addition there is a sum for division equally between the preferred and the ordinary shareholders; £120,000 goes to reserve, and £47,948 is carried forward.

## COMMENTS.

THE Lord Chief Justice, with Justices Ridley and Darling as his colleagues, has administered a rebuke to the police, which should be a useful warning to those who inspire their policy, as well as to the officers directly concerned in its execution. Last March the police at Croydon measured a portion of highway in the London Road, with the intention of timing motorists who were journeying that way. Mr. Little, a local resident, becoming aware of the purpose of the watchful constable, informed the drivers of a few cars that it would be well if they drove carefully, as there was a police trap in operation. For thus assisting motorists to observe the law he was summoned by the police for obstructing them in the execution of their duty. But the Croydon magistrates were wiser than the prosecutors, and the summons was dismissed—a decision in accordance with common sense, for, as we pointed out at the time, the duty of the police is not to lay traps in anticipation of offences being committed, but to preserve the lives and property of the public, and prevent the committal of criminal acts. A trap certainly does not do that.

### Warning is Legal.

THIS, however, was not apparent to the official mind, and so the police gave notice of appeal. The case was heard on Tuesday, when judgment was given for Mr. Little, the Lord Chief Justice observing that he was by no means satisfied that no offence had been committed. The fact that judgment was pronounced in somewhat grudging terms makes the decision the more satisfactory to motorists who have no desire to inconvenience other users of the road or hurt any human being or animal thereon. But they do protest against methods which are frequently open to suspicion, and generally clumsily worked by men of undoubted bias but dubious ability.

### The New Deasy Car.

THE latest addition to the ranks of British-built cars is the Deasy, which was officially started on its career by a lunch given by the Deasy Motor Car Manufacturing Company, Ltd., to a number of representatives of the Press on Tuesday last. The chair was occupied by Captain Deasy, who, to indicate the growing importance of the British automobile industry, stated that it had been computed that about £12,000,000 is already invested in motor-car companies in this country, that the value of British cars manufactured during the first nine months of the current year exceeds three millions sterling, and that about a quarter of a million of men are employed in the United Kingdom in the manufacture and driving of motor-cars. He afterwards dealt briefly with the chief features of the new Deasy car, leaving to Mr. E. W. Lewis,

its designer, the task of more fully explaining the details. The lunch over, an opportunity was afforded us of inspecting a chassis of the new vehicle, which is of 24-h.p., and which comprises a number of special points—notably in the design of the engine and the suspension of the frame—to which we hope to refer more fully and also to illustrate in a later issue.

### The Cars of 1907.

IN our next issue we shall publish a complete list of the cars for 1907, with particulars as to the more important details of their design. This will be arranged so as to afford a guide to the forthcoming Show, as well as to the cars for the season that will follow Cordingley's Exhibition at the Agricultural Hall, spaces for which are being so well taken up that a great success is already assured. The remarkable expansion of the industry in all directions, the advent of new firms into the business and the attention which established concerns in other trades have given the motor-car, have made it clear that the Agricultural Hall display is as necessary to the automobile movement as it was in the days when prejudice was more pronounced than now. With regard to the compilation of cars that will be a feature of next week's *M.C.J.*, these will be classified according to price, so that visitors, by referring to our list and consulting their own estimate of what they wish to expend, will be able readily to learn what cars are available for their selection.

### Magisterial Insolence.

AT the Kingston Police Court, last week, a young fellow was summoned for driving to the common danger on the Portsmouth road. His principals were in the car at the time and the speedometer showed twelve miles an hour. Having his licences for the three years he had had them, the defendant called attention to the fact that they were without endorsement, when one of the magistrates brutally exclaimed, "It was time they were endorsed."

### Technical Instruction in Scotland.

ON Wednesday next, the anniversary of the Motor Car Act, Professor Stanfield will commence his course of instruction on motor-car engineering at the Heriot-Watt College, Edinburgh. This will be specially intended for owners, users, and drivers of motor-cars, and will consist of lectures, laboratory work, and drawing office practice. The laboratory at the College is equipped with several forms of oil, gas, and petrol engine, and various types of motors will be exhibited during the course, many leading makers assisting Professor Stanfield—who has acted as an honorary observer on the last two Scottish Trials—in this way. The class will also be extended for the purpose of giving instruction in the repair and adjustment of the various mechanical parts of a motor-car. We are glad to learn that the Scottish Automobile Club has agreed to offer a medal to the student attaining the highest proficiency in the class.

### The Shows.

THE season of the shows is upon us, and journalists are getting ready for a busy season in chronicling the advent of new cars and reporting upon the fresh features of the old ones. Invitations to social gatherings and sumptuous banquets—for the motor industry is prosperous and can afford to be regally hospitable—adds to the worry and confusion of these early days of November. With regard to the Shows we would offer a word of advice to exhibitors. They must remember that the public now inquiring as to the details of the mechanism is a more intelligent public than that which became curious in the early days of the Shows. Hence the necessity for providing attendants who to courtesy and patience add knowledge. That there is considerable information abroad as to automobile matters is a fact which must be increasingly recognised in arrangements for stands for motor-car shows.

Lord Roberts leaving the historic Hand Hotel, Llangollen, during the course of his recent tour through North Wales.  
Photo by [S. R. Martin.]

### Motoring in Jamaica.

JAMAICA has its Motor Union, of which Mr. Ernest Nuttall is hon. secretary. Last season there were quite a number of motor vehicles on the island, and from Mr. Nuttall's article on another page it is evident that they had "a good time"—climate and scenery being equable and picturesque respectively. So far as residents are concerned, cars must be registered in the parish where the owner resides—a procedure slightly different to that which obtains in this country. Otherwise the regulations are very similar to those prevailing in Great Britain, and, although there is no speed limit, motorists must have regard to the safety and convenience of other users of the road.

### Children on the Roads.

REALLY Mr. Cathcart Wason is incorrigible. He has again appeared as a House of Commons querist, asking the Home Secretary whether his attention had been called to the report of a recent motor accident and the running over a child of three years of age, and to the remarks of the coroner that children should not be allowed to wander along highways at dangerous places, and that chauffeurs could not be expected to look after their machines and children; and whether he would take steps to remove the coroner from all City magisterial functions. Mr. H. Gladstone replied that he had no power to remove

any coroner from office, but was addressing an inquiry to the coroner in question on the subject of the remarks attributed to him. We hardly understand the necessity for the Home Secretary to bother about the matter at all, for surely it is quite reasonable to impress the public with the idea that the roads are intended for purposes of travel and locomotion, not as playgrounds.

### The Taxation of Cars.

WHENEVER Mr. Wason addresses a question on automobile matters, Mr. Galloway Weir generally follows. The former M.P. was curious on Monday. Mr. Weir was a questioner on Tuesday, inquiring of the Chancellor of the Exchequer if he would consider the expediency of placing a tax on motor-cars on a scale rising in proportion to their horse-power. "The Royal Commission," Mr. Asquith answered, "have recommended against the taxation of motor-cars on the basis of horse-power or cylinder capacity, in view of the administrative difficulties involved and of the fact that the experience of its working in France is not entirely satisfactory. The whole question of the taxation of motor vehicles is being considered in connection with that report; but I am not in a position to say whether I shall have any proposals to make on the subject until the time comes for introducing the Budget." The latter part of the reply is quite in accordance with the usual demeanour of Chancellors anxious to keep their own counsel; the first portion of the answer suggests that the lines of the recommendations of the Commission with regard to taxation are likely to be followed in the Government's Bill of next year.

### A Judge on Motor Buses.

IN summing up a case in which damages were claimed against the London Motor Omnibus Company, Limited, for personal injuries sustained in an accident, Mr. Justice Bigham has just said that the main question was whether the defendants were liable for any compensation at all. They were not responsible unless the plaintiff was injured in consequence of some negligence on the part of the defendants or their servants. The negligence alleged was that the omnibus skidded as the immediate consequence of excessive speed, and the jury would have to say whether the vehicle was being driven at excessive speed at the time of the accident. Of course, a motor-omnibus ought to be driven at a less rate of speed when the roads were greasy. Every miscalculation of distance on the part of the driver did not amount to negligence. They were all liable to errors of judgment, and it would be unfair and unreasonable to say that every error of judgment was the result of negligence. It was one of the infirmities of our nature. There was some suggestion that this omnibus was improperly constructed, but there was no evidence of that. People could not be expected to anticipate every improvement that might be brought out in the next half-century. If this omnibus had all the ordinary and normal provisions the defendants could not do more. After such an expression of opinion the jury returned a verdict in favour of the motor-bus company.

### A Motorist's Views.

THE letter from Alderman T. Scott Foster, J.P., on another page, raises many problems of importance, and suggests one or two useful rules of conduct for motorists, as well as other users of the road. He is an enthusiastic motorist, and, as an examiner of the motor-car classes for men retiring from the Marine Artillery and other branches of the two services, is doing useful service in his locality. Always driving with care, he may be regarded as a type of the gentleman-motorist who is really interested in the mechanical side of motoring. For he pays regard to "the little things that matter," and has recently fitted taps to his carburettors by which to drain off any petrol that may remain after a run. This generally amounts to three or four ounces, and its removal assists in starting when the car is

next taken out, as there is no stale petrol in the carburettor. Motorists like Alderman Scott Foster, of Scuthsea, are doing much to preserve the public in their immediate localities from the exhibitions of bias and venom which seem to be permanently displayed against motorists in several towns and many large villages.

#### Scouts on the Road.

♦ WILL the roads in country districts ever become overcrowded? The question is suggested by a letter from Mr. Edward Gardner, who wants to form an association "to form bodies of scouts to patrol the main roads, whose duties would be to take the numbers of cars committing offences under these Acts, and names of witnesses of such offences, and to prosecute such offenders." This is apparently a piece of flattery to the Automobile Association, whose scouts, however, serve the purpose of warning motorists, when they are going too fast, to slacken their speed instead of breaking the law. This is more useful work than being on the road merely for the purpose of

villages; that it should be made an offence to cause annoyance or loss to persons on the road through dust; that the motor-horn should be abolished and a bell substituted; that means should be taken to prevent the escape of noxious fumes; that a maximum candle power should be fixed for head-lights; that the owner should be liable to prosecution as well as the driver if he is present when an offence is committed; and that a register should be kept at all the principal police stations.

#### The Motor Cab.

♦ WILL it be necessary to warn the London cabman that he cannot prevent the introduction of the taximeter into public service? In fact, we fail to see why he should really desire to withstand the change which, adapted to the motor-cabs shortly to be introduced, will effect quite a revolution in the traffic of the streets of the metropolis. There are several things that should tell in favour of the motor cabby with his taximeter. At present many people do not patronise the ordinary horse-drawn vehicle because of the uncertainty pre-

A 40-h.p. Crossley car with Mr. Filson Young, the well-known author, at the wheel, and carrying as passengers Lord Raglan and Lord Raglan's son and daughter, the Hon. Fitzroy Somerset and Miss Somerset. The photograph was taken in the Isle of Man during the Tourist Trophy week.

waiting until people have committed a technical breach of the peace and then seeking to secure their conviction in a police-court. Besides, there seems something un-English in the proposal.

#### A Council's Wisdom.

♦ THERE is a rich antiquarian flavour about the deliberations of the bucolic wiseacres of Hayfield. They have a Rural Council; that rural council has been having a meeting; the meeting has been receiving suggestions; and the suggestions are really voluminous. One speaker would send motorists to prison with the Suffragettes; another would erect toll-bars to obstruct the onward rush of the speedy car; these and various other proposals have been considered, exciting various views and encountering opposition of a more or less decided nature. But at length the Council did agree upon some conclusions, of which the following are the more important, viz.:—To recommend that the speed of motors should be limited to fourteen or fifteen miles an hour, and that power should be conferred on local authorities to fix lower limits in towns and

vailing with regard to the fare; that will be destroyed by the mechanical recorder. Then the speed of the motor-cabs will attract a larger area of patronage, while the reduction of the present minimum fare would be of great assistance in widening the circle from which "fares" are drawn. As a matter of fact the Cabmen's Union has long sought to interest its members in motor matters; the taximeter seems a natural corollary of the adoption of mechanical transit.

#### Sympathy from a Bench.

♦ THE sympathy of the Huddersfield Bench and the imposition of "the minimum fine adopted in that bench, viz., £3 and £1 1s. 6d. costs," were both bestowed upon a motorist who was summoned at the police court for travelling at a speed exceeding twenty-five miles per hour. The police had elaborated their trap at Edgerton, but it was impossible for the driver to defend himself, being informed on a subsequent day of the intended prosecution when it was too late to obtain witnesses. Mr. F. A. Reed, of Messrs. Learoyd and

Co., defended, and emphasised the point just mentioned, at the same time calling attention to the views of the Royal Commission on the subject of the speed limit. But to no purpose; they apparently have a "minimum fine" of their own at Huddersfield, and such the motorist will have to pay. The "sympathy" extended apparently carried no monetary reduction.

#### Of Interest to Pedestrians.

THE correspondence now proceeding in the columns of a contemporary with regard to motorists and the public has moved Mr. Arthur Wimperis to the preparation of some suggestions to those who wander on the road, from which the following may be taken as samples of the series:—"Pedestrians before going outside their own premises should ring a bell for five minutes, announce their exact moment of exit by waving a white flag, attached to a stick or umbrella, and should be compelled by the police to walk in the ditch, if any. In cases where there is no ditch the pedestrian should be compelled to provide himself with spring-heeled boots and climbing-irons. He would thus be enabled to spring lightly from the roadway into the nearest tree upon the approach of a car. Incidentally, this would add greatly to the excitement and pleasure of motoring, while affording healthy exercise to the pedestrian and lending animation to the scenery of frequented highways. At intervals of, say, half a mile on all high roads ambulance depots should be fixed, containing stretchers, splints, bandages, and all paraphernalia for expeditiously removing what is left of inconsiderate pedestrians who transgress the new rule of the road. It is infamous that motorists should have to clear up their own litter as they do at present." Motorists can laugh at such implied strictures; there is no need to worry.

#### Guildford Justice.

ONE of the victims of police activity at Guildford sends us full reports of the proceedings in several cases heard by the Bench there the other day. These reveal a tendency to believe the police and ignore the sworn evidence of witnesses that should really be watched by the Motor Union. To take one instance at random, some witnesses declared that a footpath was in existence in a certain place, and whether this was so or not was really material to the matter. Yet in a previous case the police had said there was no footpath. The magistrates, instead of probing thoroughly into the question, merely fined the defendant—apparently in accordance with the custom of the court.

#### The Motor Tyranny.

MR. G. LOWES DICKINSON has an article in the current "Independent Review" which he judges will appear to motorists as "outrageous, monstrous, and absurd." In saying this he does himself an injustice, for we have become so accustomed to the vituperative outpourings of wrath from the pens of anti-motorists that his mild diatribe will distress no one in particular. It is too obviously lopsided in view to have any effect upon public opinion, consisting mainly of a string of conclusions based upon some of the slenderest evidence tendered to the Royal Commission. Only that which suited his purpose has been selected. Mr. Dickinson declares that it is sufficient condemnation of the policy suggested by the Commissioners that it is generally opposed by the chief constables of counties. That is one reason why the public will support it. The official police view must be in favour of the speed limit as against the proposals of the Commission, or they would be condemning their own methods during the past few years. While the article in the "Review" is of little moment, an editorial comment is more notable as revealing the invasion of the biassed atmosphere into the sanctum of the writer, who says that "ten or twelve miles an hour in the open country, and six in towns and villages, are the utmost limits compatible with public safety and he comfort of householders who have the misfortune to live on

main roads." This is really too simple, and some organisation ought to arrange a motor trip through Surrey police traps for the automobile education of the editor of the "Independent Review"—an interesting magazine with a variety of contents in addition to the screed about the Motor Tyranny.

#### Motor Ambulances.

LONDON is considerably behind some provincial cities in the matter of street ambulances, and we readily endorse the opinion of the Metropolitan Street Ambulance Association that "a motor-ambulance with a first-aid attendant should be held in readiness at various fixed points in the London area. The telephone would keep the various centres in touch with the police and hospitals. The fittings and stores for each ambulance could be obtained and renewed at the central depot of the St. John Ambulance Association, and in this way the movement might have its valuable supervision." Of course, the necessity for the provision of motor-ambulances is not so great in the heart of the City as in the suburbs; but there are many districts in the Metropolitan police area where such appliances are really wanted.

OUR readers will regret to learn that Mr. Walter Gibbons, one of the most active members of the committee of the Automobile Association, has had to undergo an operation for appendicitis. We are glad to hear that he is in a fair way to recovery, and trust this will be speedy and sure.

THE profit of Argyll Motors, Ltd., for the year ended September 30th last, is £74,915. The directors recommend that £11,000 be placed to reserve account, and, after providing dividends at the rate of 6 per cent. on the preference shares, and at the rate of 10 per cent. on the ordinary shares for the year, that the balance of £6,950 be carried forward, subject to deductions as formerly.

WE would express the hope that the Bohemian concert in aid of M. Rene Thomas, the French motor-cyclist, who sustained severe injuries on the Canning Town track last July, and who is still an inmate of Poplar Hospital, will be well supported. It will take place on Monday next at Frascati's Restaurant, London, W. Those who cannot attend may send subscriptions to the treasurer of the fund now being raised, Mr. A. G. Reynolds, Rookstone, Woodford Green, Essex.

AN agency for the Florentia cars, which have attracted much attention at the Paris Salon and other international exhibitions, has now been established in London. Messrs. De Brou and Co., Ltd., have obtained the sole concession for these vehicles, and examples of the 18-24-h.p. and 40-50-h.p. cars can now be seen at the firm's new showrooms at 34, Hans Crescent, opposite Harrod's Stores, S.W. They will make their first appearance at a British exhibition at the forthcoming Stanley Show at the Agricultural Hall, when an 18-24-h.p. polished chassis will be a feature of the car section of that display.

DISSOLVED acetylene is a system of lighting automobiles which has been successfully used on Messrs. Tilling's motor-buses and those of many other companies for eighteen months past. It is now being adapted to the purposes of the light touring car in the following way:—A neat polished oak or mahogany case carried on the footboard contains a cylinder of the dissolved gas, which is turned on by a tap to the burners when required to be used. The twenty cubic feet of gas contained in the cylinder is sufficient to serve the two headlights of an ordinary touring car for forty hours, not necessarily consecutively, but the occasions extended over as many days, weeks, or months, as may be convenient. When exhausted the cylinders may be exchanged, a gauge in the case giving ample warning when this is likely to occur. Agencies are being established throughout the country for the exchange of cylinders, and a central depot has been opened at 20, Long Acre, London, W.C., by the Motor Lighting Co., who will be glad to hear from firms who recognise the value of the idea they have incorporated in their speciality.

## MOTORING IN JAMAICA.

BY ERNEST NUTTALL.

IT was Julian Hawthorne who said that, "Commerce aside, the island of Jamaica is beyond the reach of all competition as a pleasure resort in winter. The sun is always warm, the nights are always cool, the atmosphere is always healthy, and you can choose your mean temperature to suit yourself. On the higher levels of the mountains you can get that of an English summer, and on the plains it will average 80 deg. or more. The scenery of sea and mountain is, on the whole, the most beautiful in the world."

Many American motorists are making holiday in the island, where the principal roads are on the whole excellent. They are the admiration of tourists, who are going over in increasing numbers each succeeding winter to escape the rigours of a northern climate. Patches of new metal, however, sometimes mar the otherwise even surface of these roads, and are hard on tyres. The motorist need give no thought to anti-freezing mixtures for his car in this tropical climate.

The nature of the country is decidedly mountainous, with the result that there are comparatively few stretches of really level road. The Blue Mountain Range runs up to the height of over 7,000 feet. It can thus be seen that the island, with its 4,200 square miles of mountain and vale, is reserved almost wholly for those lovers of nature and the picturesque to whom the greatest exhilaration comes not in rushing over level country at fifty miles per hour, but in the steady, if less rapid, rise from plain to mountain top, where each turn of the winding road reveals new beauties, and the torrid heat of the lowlands gives place to the balmy atmosphere of everlasting spring. There are at present in Jamaica comparatively few resident owners of motor-cars—probably not more than a score in the whole island. Steam finds most favour. During the tourist season, say, from November to April, with the exception of an occasional shower, one may look for fine, clear weather. The rainy "seasons" fall in May and October.

Two or three causes have so far militated against the automobile coming into general use. First, the lack of properly equipped repair shops; secondly, the high import duty on gasoline, which renders it impossible to retail the article under 60 to 70 cents per gallon.

The Government has so far resisted all appeals from the Jamaica Motor Union to reduce the duty, and has failed to appreciate the immense benefit which the island would derive from the influx of a large number of motorists each tourist season.

There are no commercial vehicles in Jamaica. Yet there is room for business. The banana trade is ever on the increase. Mule carts, wagons and drays are employed in this traffic, and motor-vans would be more satisfactory under certain conditions. First of all gasoline must be eliminated and either kerosene motors or steam cars used instead, if possible with crude oil as fuel. A maximum speed of twelve miles per hour is sufficient, and good hill climbing power a desideratum.

The mails and mail coach passengers could for the most part be handled with advantage by motor-buses, as in Porto Rico. Probably a few light delivery vans might be disposed of in Kingston (the chief town), but until a repair and supplies shop is established this branch of the industry will languish. Such an establishment is not likely to prove a success until the standardization of parts becomes general.

One business advantage the island possesses is that English is the language spoken, but this is offset by the high import duties—16 per cent. *ad valorem* on cars and 15 cents per gallon (English) on gasoline.

For the benefit of intending visitors to Jamaica it may be stated that the motor-car law is not unreasonable in its provisions. There is no speed limit, but one must be careful of the lives and limbs of the humblest of His Majesty's liege subjects, and must regulate speed in accordance with the traffic on the roads. Also, "the rule of the road is a paradox quite, for if you keep to the left you will always be right," except in overtaking

a vehicle, which should be passed on the right. In the event of an accident occurring, whether or not the motorist is in fault, he must stop, and, if required, give his number.

Last season there were quite a number of cars here, and comparatively few accidents occurred. All claims were, with the assistance of the writer, settled out of court to the satisfaction of the motorists concerned.

The motor vehicle law passed by the Legislative Council in 1905 provides that every motor-car shall be registered with the collector of taxes for the parish in which the owner resides or carries on business (except the owner be a person not resident in Jamaica, in which case it shall be registered with the collector of taxes in the parish into which it shall have been first introduced or in which it shall have been acquired by such a person), and that every collector of taxes shall assign a separate number to every motor-car registered with him. The fees are 10s. for cars and 5s. for motor-cycles.

It is also provided that a person shall not drive a motor-car on a public highway unless he has a licence for the purpose, and no one may employ an unlicensed driver. Any person under the age of seventeen years is disqualified from obtaining a licence except that one for driving motor-cycles may be granted to a person over fourteen years.

Off on a Shooting Expedition.

[Allgemeine Automobil Zeitung.]

The Jamaica Motor Union is at present in its infancy, having uttered its first cry (a protest against the high duty on gasoline) towards the close of the year 1905. The objects of the Union are those for which most similar organisations are established—principally the encouragement of the use of mechanically-propelled road vehicles, the discouragement of inconsiderate driving, the supplying of information on general subjects connected with motoring, opposition to Bills introduced into the Legislative Council and local bye-laws embodying proposals restrictive of automobilism, and the negotiating with local authorities for the improvement of roads and removal of dangerous corners.

To motor-cycle racing in this country some interest was given last year by the visit of Henri Cissac to the Brighton and Blackpool motor meets, at the latter of which, in July, he set up world's records, doing the flying kilometre in 25 3-5 sec., the standing start kilometre in 35 sec., and the mile (standing start), in 50 1-5 sec. Among the notable performances of British riders must be reckoned J. S. Campbell's victory in the English eliminating trials over the Isle of Man course, and C. R. Collier's British record of 54 miles 523 yards on the Canning Town track.

## THE 1907 SIDDELEY CARS.

As was mentioned in the last issue of the *M.C.J.*, the Wolseley Tool and Motor Car Company are building seven models of cars for touring and town use for the 1907 season. Of these three, while improved in many of the details, are on the same general lines as the 1906 cars; we refer to the 15-h.p. live axle and 18-h.p. and 40-h.p. chain-driven vehicles, in all of which the engine comprises four separate cylinders. The 15-h.p. is well adapted to receive bodies designed for town work, and, in fact, it was a vehicle of this class which secured a gold medal in the recent Town Carriage competition; the 18-h.p. chain-driven machine is being continued on account of its popularity in the colonies, while the 40-h.p. model, which is an enlarged edition of the 1906 32-h.p., is intended for

Still dealing with features which are found on all the four new types, it may be stated that the frames are of pressed steel, the engine has the cylinders cast in pairs complete with heads and water jackets, and the valves, both inlet and exhaust, located on one side and operated off a single cam shaft. The inlet valves are provided with a variable lift device, by means of which the speed of the engine can be regulated as desired. This is obtained by the medium of a sliding rack, which meshes with small pinions that work on screw threads on the upper ends of the valve push rods, the distance between the latter and the valve stems being thus varied by means of a lever on the steering wheel. An automatic governor is also fitted, which acts on a throttle valve in the inlet pipe, a foot accelerator being provided to put the governor out of action when desired. Removable covers fitted to the base chamber of the motor enable the big

Figs. 1 and 2.—Elevation and Plan of Siddeley 30-h.p. Live Axle Car.

the use of those motorists who desire to fit a somewhat heavy body to the chassis. Having briefly dealt with three of the seven 1907 types, we come to the remaining four, which, being of a new design, call for more extended notice. They comprise a 10-h.p. double-cylinder, 18-h.p. and 30-h.p. four-cylinder and a 45-h.p. six-cylinder; the first three having live axle and the latter side chain transmission. A feature of these four vehicles is that many of their components have been standardised, and are common one to another, the cost of production being consequently reduced. Thus the engine of the 18-h.p. four-cylinder car is identical as regards design, bore and stroke with that of the 10-h.p. two-cylinder, the pistons, valves, valve springs, &c., all being interchangeable. Again, the new 45-h.p. six-cylinder machine has an engine which, except as regards the number of cylinders, is exactly similar to that of the 30-h.p.

ends to be readily inspected. All the bearings throughout the vehicle, except those on the engine, are of the ball type, while in all cases the shaft which connects the clutch with the gear-box is provided with a universal joint to provide for any want of alignment between the two parts, and to permit of either being dismantled without disturbing the other. The front axles are of I-section forged steel and of the dropped type.

Passing now to the details of the 10-h.p. car, which is the smallest vehicle the Wolseley Company are building for next year, the engine, which has two cylinders, 4 in. bore by 4½ in. stroke, is set in the fore part of frame under a neat bonnet. The water circulation is on the thermo-siphon system through a honeycomb radiator with a special design of air-inducing fan. The ignition is by coil and accumulators, the advance and retard being controlled on the 18-h.p., as well as on the 10-h.p. car,

by a lever projecting from the dashboard. The clutch is of the leather-faced cone type, and is operated by a push pedal; the gear-box is arranged to give three speeds and a reverse with direct drive on top, actuated by a single lever working in an ordinary notched quadrant. A cardan shaft having a universal joint at the forward end and a sliding one at the rear conveys the power through bevel gearing to the rear live axle, which drives the rear road wheels through squares on the end, the wheels themselves running on ball bearings on the axle casing, this design being also adopted on the 18-h.p. and 30-h.p. live axle cars. As regards the brakes, these are all of the metal-to-metal type, a pedal operating one of the contracting pattern, working on a drum at the rear end of the gear-box countershaft, and a pull-up hand lever actuating internal-expanding brakes working on drums attached to the rear road wheels. The chassis, which weighs  $11\frac{1}{2}$  cwt., has a wheel base of 7 ft. 6 in. and a track of 4 ft.  $0\frac{1}{2}$  in.; the road wheels are 30 in. in diameter, shod with 90 mm. tyres.

The 18-h.p. car follows closely on the lines of the 10-h.p., the main differences being outlined below. The engine, of which two views are given in Figs. 3 and 4, comprises four 4 in. by  $4\frac{1}{2}$  in. cylinders. As in the 30-h.p. and 45-h.p. vehicles, the water circulation is maintained by a gear-driven pump, the

made to rise and fall in the lower half. In this way the worm gear is not only employed to drive the contact maker, but also to effect the advance and retard by shifting the angular position of the commutator spindle relatively to the gear which causes it to rotate. In other words, not only is the worm gear used for driving purposes, but it also acts as a sort of rack and pinion, for as the worm rises it alters its position in relation to the worm wheel, while still continuing to drive the latter. The carburettor is located on the right-hand side of the engine; it is carried rather higher than usual, the admission pipe extending across between the tops of the two central cylinders. Another point about the motor which is worthy of notice, and which is shown in Figs. 3 and 4, is that the starting handle, instead of being supported by the frame, is attached directly to the engine. The bottom half of the base chamber is so arranged that it can be removed without disturbing the three bearings on which the crank-shaft runs. Two lengths of chassis are made, one having a wheel base of 8 ft. 9 in. and the other 9 ft. 9 in. The front springs are of the semi-elliptic, and the rear pair, which are of a good length, of the three-quarter elliptic type, the latter being outside the frame.

An elevation and plan of the 30-h.p. car are given in Figs. 1 and 2. Here again the general design is similar to the 18-h.p.

Figs. 3 and 4.—Longitudinal and Transverse Sectional Views of 1907 Siddeley 18-h.p. motor.

mixture is furnished by a pressure-fed automatic carburettor, and the ignition is effected by means of a gear-driven high-tension magneto, the latter being so fixed that it can readily be dismantled. Provision is also made for the use of a supplementary ignition by coil and accumulators to work with the same wiring connections. The arrangement of the contact maker and the system adopted of advancing and retarding the same is an interesting feature of the design, and reminds us somewhat of that adopted in the Brotherhood cars. As will be seen from Figs. 5 and 6, the contact maker itself is located under the bonnet on the engine side of the dashboard, its spindle projecting through the latter to actuate the mechanical lubricator. The necessary rotary motion to the spindle is effected by a light shaft driven at its lower end by spiral gearing off the cam shaft, and fitted at its upper end with a worm, which meshes with a worm-wheel on the contact maker-lubricator spindle. The final worm drive is also utilised to bring about the advance and retard of the ignition. To this end the connecting light shaft is made in two parts, the upper portion being at its lower end of a square section, fitting into a square hole in the lower part in such a way that, while the two must rotate together, the upper part can, under the action of the ignition lever, be

vehicle, and except in the instances specified below the details of the two vehicles are the same, the various parts naturally being of larger proportions to suit the higher power available. The bore and stroke of the four-cylinders is 4 5-8 in. by 5 in. The clutch is of a new metal-to-metal cone type. A sectional view is given in Fig. 7, from which it will be seen that it is designed to run in oil, and that the engagement of the two surfaces is maintained by a spiral spring, the tension of which can be readily adjusted. The gear-box, both in this model and the 45-h.p., is adapted to give four speeds forward and a reverse, with a direct drive on the third speed, the idea being to allow the bulk of the running of the car to be done on the direct drive, the top indirect speed being only brought into use for especially fast work. The various gears are all controlled by a single lever working in a "gate," which gives a separate motion for each speed with a positive interlock between them. The 30-h.p. chassis has a wheel base of 10 ft. 2 in., the space available behind the dashboard for the body being 7 ft. 11 in.

Finally we come to what is probably the Wolseley Company's most important innovation—the 45-h.p. six-cylinder car, for which the side chain drive has been adopted. The engine consists of three pairs of twin cylinders of the same bore and

stroke as used in the 30-h.p. vehicle. The design of the crank shaft for this engine has received special care, with the object of obtaining a perfect balance. To this end the second and fifth cranks are provided with discs, while the two central cranks, Nos. 3 and 4, have a crank pin which is common to both. The shaft itself turns on four long bearings. A single carburettor

Figs. 5 and 6.—Longitudinal and Transverse Sectional View of Contact Maker and Lubricator actuating Mechanism.

furnishes the mixture for all six cylinders, while the ignition and other details of the engine are the same as on the 30-h.p. car, this remark also extending to the clutch and gear-box. In view of its high power, the brake capacity has been increased by the fitting of two wide brake drums on the differential shaft, one on each side of the gear-box, the usual hand-operated brakes on the rear wheels being also provided. The vehicle has a wheel base of 11 ft. 3 in., which provides ample accommodation for any type of body.

In the foregoing description we have only been able to refer somewhat generally to the more prominent features of the new Siddeley cars; there are many points of interest in the details which pressure on our space prevents us dealing with at this time. Suffice it to say, therefore, that in the course of our recent visit to the Wolseley Company's works at Birmingham

Fig. 7.—Sectional Elevation of new metal-to-metal Clutch.

we had ample evidence that not only is great attention paid to the selection of suitable materials, but that every care is taken in producing from these materials automobile components which, when assembled together to form the complete car, should maintain, if not add to, the reputation for reliability which the vehicles turned out by the company have so long enjoyed.

## CONTINENTAL NOTES.

### A Run of Old-Timers.

Considerable interest is being shown in the run of old-time motor-cars which is to be held in Paris on Sunday next. Meeting in the Place de la Concorde at 9.30 a.m., the vehicles will run through the Bois de Boulogne and up the Suresnes Hill to Sevres, the return being made by the same route in the afternoon. Already over twenty entries have been received, they including several 3½-h.p. Benz, 4½-h.p. Panhard, 2½-h.p. Renaults, 4-h.p. Peugeots, a Hildebrand-Wolffmüller motor-bicycle, and several De Dion tricycles.

### Six-Cylinder Cars.

A new addition to the list of builders of six-cylinder cars is the Germain Company, whose vehicle will make its *debut* at the forthcoming Paris show. The dimensions of the cylinders are 120 mm. bore by 130 mm. stroke, and the crank shaft runs on specially large ball bearings; three speeds forward and reverse are provided, with direct drive on top speed, the transmission being to a live axle on a patent pressed steel system.

### An International Race in Germany.

Prince Henry of Prussia announced at a banquet in Berlin on the 1st inst., held in connection with the Automobile Exhibition in the German capital, that the Emperor would offer a prize for competition in the international motor race which the German Imperial Automobile Club intends to hold next year. The Emperor has expressed his willingness that the race should take place in the middle or end of June on the Taunus circuit, where the Gordon Bennett race was held in 1904.

### Speed Trials at Origny-Sainte-Benoite.

Interest in the speed trials at Origny-Sainte-Benoite, near Saint Quentin, France, held on Sunday last under the auspices of "Les Sports," was greatly damped by the soaking wet day. The trials were on somewhat novel lines, as the course on which they were held comprised 100 metres of level road, a kilometre rise of an average gradient of 7 per cent., 700 metres on the level, and 200 metres downhill; the competitors being timed over the whole distance. Fifty-four cars were duly weighed in, but owing to the bad weather only thirty-seven appeared on Sunday morning, and, in view of the bad state of the road, it was eventually decided to postpone the racing car class until Monday. In the touring category, the best time of the day was made in the four-cylinder section (minimum and maximum bore of respectively 140 mm. and 160 mm.) by Viton on a Rochet-Schneider, he covering the two kilometres in 1 min. 28 1-5 sec., equal to 51 miles per hour. Van der Stegen on a Germain was the first in the class for cars having engines with a bore of between 85 and 95 mm., his time being 1 min. 56 3-5 sec., or 38½ miles per hour. Better weather prevailed on Monday, when the trials of the racing cars were run off. The best time of the day was made in the heavy car section by Mr. A. Lee Guinness, who on his 200-h.p. Darracq covered the two kilometres in 1 m. 0 2-5 sec., equal to 74½ miles per hour. Mr. Cecil Edge on his six-cylinder Napier being second in 1 m. 6 4-5 sec. Nivet, on a Darracq, was the victor in the 250-400 kilog. category in 1 m. 44 1-5 sec., and Demogeot first in the 400-650 kilog. class in 1 m. 8 2-5 sec.

### A Reliability Trial for Voiturettes.

A reliability trial for voiturettes, held under the auspices of the "Auto," was commenced on Monday last. Twenty-two cars were entered for the event, these comprising a Metais, three Civelli de Bosch, three Lion Peugeot, three Delage, two Alcyon, a Vulpes, three Sizaire-Naudin, an Ibis, two Bolide, a Mieusset, a Foullaron, and an Auto-Stand. The cars are divided into two classes—single-cylinders with a maximum bore of 120 mm. and two-cylinder machines up to 90 mm. bore—a limit to the total weight of the car being fixed in proportion to the cylinder bore. The trial, which will terminate on Monday next, com-

prises six daily runs of about 200 kilometres, during which an average speed of 30 kilometres per hour must be maintained, and a final run of 250 kilometres confined to those entrants who have maintained the specified speed throughout the six stages. The event is being run off over a 31 kilometre circuit in the Saint Arnould district. The rules provide that drivers may be changed at the start of each stage only, that repairs may only be performed by the two occupants of the car, and that all replenishments and repairs, &c., including tyres, will count in the time occupied by the competitors.

#### The Berlin Motor-Car Exhibition.

A motor-car exhibition, organised by the German Imperial Automobile Club in conjunction with the German Motor Manufacturers' Union, was opened in the buildings of the Zoological Gardens, Berlin, on the 1st inst., and will continue until the 12th inst. The show, which was opened by the Crown Prince in the unavoidable absence of the Kaiser, owing to the latter's

sixth day, Munich-Homburg, 460·6 kilometres. A hill-climbing competition up the Kesselberg will be included in the third day's run, and a speed trial in the Forstenrieder Park, Munich, on the fourth day.

#### Public Services in Germany.

Negotiations are in hand with a view to establishing a motor-omnibus service between Dollnitz and Halle.—A company is being formed at Neustadt to run a number of motor vehicles in the town for the conveyance of both passengers and goods.—The municipal authorities of Cassel have just appointed a special committee to inquire into the question of a motor-'bus service in the town.

#### A Special Road for Automobiles.

The Prussian Forestry Department is considering a plan to construct a special road for motor-cars between Berlin and Wannsee, which latter place is much frequented owing to its

The Speed Trials at Origny-Sainte-Benoite in the rain on Sunday last.

indisposition, is by far the largest that has so far been held in Germany, there being close upon 400 exhibitors, while its international character may be gathered from the fact that cars of German, French, Italian, Belgian, American, Swiss, Austrian and British construction are on view, the latter including the Daimler and the Humber.

#### The Herkomer Trophy Touring Contest.

The Bavarian Automobile Club has issued a provisional programme of the 1907 Herkomer Trophy touring competition, which will probably be held in June. It is proposed that the contest shall extend over six days, during which time a distance of 1,782 kilometres will be covered. On the first day the run will be from Dresden to Meiningen, 368·7 kilometres; on the second, Meiningen-Munich, 403·7 kilometres; third day, Munich-Lindau, 312·2 kilometres; fourth day, return to Munich by a shorter route, 236·8 kilometres; fifth day, rest in Munich; and

lovely situation and surroundings. The proposed road would be about ten miles long.

#### Miscellaneous Items.

A motor-'bus service is about to be started in Paris between the Place Pigalle and the Halle aux Vins.—A movement is on foot in Switzerland with the view of inducing the Government to forbid the driving of motor-cars on Sundays and holidays.—The police authorities of Bonn, Germany, have issued a regulation forbidding the use of motor tyres fitted with non-skid studded covers or bands.—The sixth annual Belgian motor-car exhibition is to be held in Brussels from the 12th to 27th January next.

A MOTOR-OMNIBUS body made by Messrs. Brown and Hughes, of Netherwood Road, Shepherd's Bush, W., is being shown on a German 'bus in the Berlin Automobile Exhibition.

## THE NEW SINGER CARS.

FOR the coming season Messrs. Singer and Co., Ltd., are bringing out a new series of cars, which, while intended for the use of motorists of moderate means, will be found, as regards the general design and soundness of construction, to compare favourably with the high-grade and powerful touring cars at present on the market. The new series includes twin, three, and four cylinder vehicles, all fitted with White and

Fig. 1.—The Singer Change-Speed Gear Control.

Poppe engines, and two and four cylinder models with Aster motors, and although the following description is that of the 7-h.p. two-seated car of which we give an illustration in Fig. 3, the remarks may, generally speaking, be taken as applying to all the types. An important feature of the design is the sectionalised system of construction that has been adopted, the speed mechanism, pedal control, gear-box and other parts, being so fitted that they can be easily detached without disturbing other portions of the chassis.

The main frame is of pressed steel, the engine and gear-box being mounted on a sub-frame of similar construction. The 7-h.p. engine comprises two separate cylinders, 80 mm. bore by 90 mm. stroke; the valves are all mechanically-operated, the inlets being located on one side and the exhausts on the other.

Fig. 2.—View of Live Axle on Singer Car, showing Differential and Bevel Gear.

A Longuemare carburettor furnishes the mixture, while the ignition is by accumulators and coil. The water circulation is maintained by a chain-driven pump and a framed ribbed-tube radiator provided with an air-inducing fan. As will be seen from Fig. 3, the combined radiator and water tank is of a neat design, and gives a distinctive appearance to the car.

The clutch is of the firm's own design, and is of the self-contained leather-faced cone type. The male and female portions are kept in engagement by three short coil springs,

which can be readily adjusted by means of three set screws. The gear-box is adapted to give three forward speeds and a reverse, with direct drive on top, and is operated by a single lever working in a "gate" (Fig. 1). When in the neutral position the lever is kept by springs in the middle of the "gate" between the two quadrant slots. To operate the gear the lever is pulled or pushed into one or the other of the quadrants, giving a medium and high gear in one quadrant when pushed fully forward or backward respectively, and similarly the low speed and reverse in the other quadrant. The gear-striking lever shaft is fitted with a pair of ball bearings, which renders it exceedingly free in its action. From the gear-box the power is transmitted by a cardan shaft and bevel gear to a strong live axle. The differential gear is of the straight pinion type. The road wheels run on ball bearings on the sleeve; the live axle transmits the power to the road wheels through dog clutches on the ends, and has thus only the driving strain to withstand.

Metal-to-metal internal-expanding brakes are fitted to the rear road wheels and a metal-to-metal brake at the rear of the gear-box. The clutch and brake pedal are carried on a separate aluminium bracket, so that they can be readily attached to or

Fig. 3.—Front View of the new Singer Car.

detached from the frame. With the exception of the engine, the car is fitted with ball-bearings throughout, including the shafts in the gear-boxes, the axles, steering heads and the differential. The control is by means of levers on the steering wheel, one operating the timing of the ignition and the other the throttle. The dashboard is made up in the dished type, and is so arranged as to form the petrol tank. At each side vertical tubes are fitted, so that if it is afterwards desired to fit a wind screen and hood this can be done with a minimum of trouble and expense. The body, which is hinged to give access to the mechanism, is comfortably upholstered, and there is ample room in the box at the rear for a spare tyre and numerous spare parts and tools. The road wheels are of the artillery type, 700 mm. diameter, shod with 85 mm. tyres.

At the general meeting of Messrs. Dennis Bros., Ltd., held at Guildford last week, a dividend of 12½ per cent. was declared, and the sum of £7,000 carried to reserve, with a substantial amount brought forward. It was also decided to increase the capital of the company to £100,000, the shareholders expressing their willingness to take up the extra shares *pro rata* to their present holding. In the last five years this company has paid three 10 per cent. and two 12½ per cent. dividends.

IN connection with H.M.S. "Excellent" at Portsmouth a class has been established for the instruction of naval men in motor-car driving.

WITH regard to the next A.C.G.B.I. tyre trials, a sub-committee of the Society of Motor Manufacturers and Traders has been appointed to wait upon the Technical Committee of the Automobile Club.

THE Sirdar Rubber Company, Ltd., have received a large order for Royal Sirdar-Buffer tyres for the Malay Federated States.

THE Wolseley Tool and Motor Company, Ltd., are shortly opening a depot in Deansgate, Manchester, which will be under the charge of Mr. A. F. Crowdy.

SIX of the crew of the Institution lifeboat at Walton-on-the-Naze have been to London to take back the "James Stevens," which has been fitted out as a motor-lifeboat.

THE Daimler Company announce that on receipt of a post-card from any owner of a Daimler car a travelling inspector will be sent to examine the vehicle free of charge.

THE Motor Union Insurance Company will commence to issue policies on the 1st of January next under a scheme of mutual insurance worked under the Companies' Acts.

SOME interest is being aroused in America by the abandonment of the branch house system by the Pope Manufacturing Company, who will in future sell their vehicles exclusively through agents.

THE Albion Motor Car Company, Ltd., are opening a showroom at 88, Mitchell Street, Glasgow, for the exhibition of the Albion pleasure and commercial vehicles, and for the conduct of their sales department generally.

F. WELLSMAN, a Newmarket stable boy, has won a £500 Deasy motor-car, raffled for at the Lockerbie Town Hall bazaar, opened last week by Princess Louise. Over 21,000 shilling tickets were sold, two of which were purchased by Wellsman.

THE fines inflicted on those responsible for the publication of articles on the Blackpool motor races, which were held to constitute a contempt of court, have been reduced from £50 to £10 on condition that the defendants publish an apology in their paper.

THE Wolseley Tool and Motor Car Company, Ltd., are anxious that their establishment in York Street, Westminster, should not be known as "Niagara," but as The Wolseley Company's Head Offices, Showrooms and Garage, or "The Wolseley Headquarters."

ACCORDING to Mr. B. G. Jenkins the weather during November will hardly be of a motoring character. His weather chart indicates a cold snap in the first week, with a succession of milder days during the second. A cold cyclonic period is predicted round the 17th, with fog about the 22nd, the month concluding with gales, thunder, and snow.

THREE simple signals have been adopted by the Automobile Association for the use of members when on the road. If generally followed, they should prove of great utility in indicating to those connected with the A.A. the dangers that lurk by the way. Illustrated sheets showing the system of signalling are supplied to members of the Association from the office, 18, Fleet Street, E.C.

COMMENDABLE was the action of the provincial clubs during the past season in securing the good opinions of chief constables and other people of influence. Such local dignitaries were invited to the gatherings at country houses and at the annual dinners, and not only was a good feeling cemented in this way, but it was conclusively proved that cars are as reliable as claimed by their devotees, and that drivers are as considerate as declared by their spokesmen. Some organisations, having regard to the dust raised by numbers of vehicles proceeding along country roads in Indian file, abandoned the organised processions of earlier years, and advised members to proceed to the rendezvous by roads of their own choice.

## HERE AND THERE.

MESSRS. HATCHER AND SONS, LTD., have been having an exhibition of "Burberry" motor clothing at their premises in Taunton.

THE services of Messrs. Hely and Co., of 1, London Road,

Sevenoaks, were requisitioned in connection with a motor-car smash which recently occurred near the town. They are well equipped to deal with all classes of repair work.

THE Scottish Reliability Trial, 1907, conducted by the Scottish Automobile Club, has been fixed to take place during the week commencing June 24th next.

AT a meeting of the Society of Engineers on Monday last a paper on "Recent Storage Battery Improvements" was read by Mr. Sherard Cowper-Coles, Assoc. M.I.C.E.

THE first petrol car ever fitted with a radiator in connection with the water circulation is said to have been the Panhard driven by Girardot in the Paris-Dieppe race of 1897.

SHEET No. 40 of the Ordnance Survey maps—now published to the trade by Mr. T. Fisher Unwin—is on the usual scale of two miles to an inch, and includes the county of Kent. The valuable features of this series are familiar to motorists.

THE Caledonian Motor Car and Cycle Company, Ltd., of Bon Accord Street, Aberdeen, have had a very satisfactory year, and the directors are contemplating a scheme of reconstruction in order to arrange for the extension of the company's operations.

AN ingenious spare tyre and tool receptacle has recently been devised by Mr. Michael Ehret, of Philadelphia, U.S.A. The arrangement is so clearly shown in the accompanying illus-

tration that no explanation is necessary. It may be added, however, that the idea can be carried out on all types of car bodies having a side entrance.

MESSRS. JARROTT AND LETTS have just issued a handy Instruction Book, which will be found extremely helpful by all users of De Dietrich cars, whether they are of the 1906 or earlier models. Those who own vehicles of this type should therefore write to the firm for a copy of the pamphlet.

BARTHOLOMEW's road surface map of London and the neighbourhood comes to hand in its strong and handy form on a scale of 2 in. to the mile. Clearly printed and accurately planned, this map, published by Messrs. J. Bartholomew and Co., is of real value to all who travel in and about the Metropolis.

THE MAHARAJAH SCINDIA has published a motorists' guide to his State of Gwalior, in which are incorporated historic sketches, together with coloured road maps, with the petrol stations and rest houses designated. The tourist in this country passes through scenes rich in architectural, historical, and ethnological interest. The Grand Trunk road runs through a magnificent continuous panorama of the early Hindu kingdoms, while the scenery is diversified mountain, plain and garden.

CAPTAIN THEO MASUI, agent-general for the Germain cars in England, is shortly leaving London for India, taking with him two vehicles which will be run in the Bombay trials. The machines have been specially constructed for hot climates, they having a larger radiator than usual, and the bodies are built stronger in order to withstand the great heat and wet. They are also fitted with an ingenious gauze screen, which, whilst keeping flies, mosquitoes, &c., from the occupants of the car, does not impair the view of the driver in any way.

MR. A. WILLIAMS has opened a motor garage at 348, High Street, Lewisham, S.E.

THE Automobile Contract Company, Ltd., have removed to 51, Conduit Street, London, W.

THE Fiat Company are bringing out a 50-60-h.p. six-cylinder car for the coming season.

A NEW garage for the accommodation of a large number of cars is being erected near Piccadilly, London, for the Electromobile Company, Ltd.

THE East Grinstead Motor Garage, in the London Road, East Grinstead, is letting cars on hire, as well as repairing wayward ones that fall by the road.

MESSRS. MOORE AND SPIERS are holding auctions of motor-cars at the Alexandra Palace on the 15th and 16th inst., and at the Gloucestershire County Ground, Bristol, on the 21st inst.

MR. GUY GOLD, 1, Cornhill, E.C., draws our attention to his "Insurance of Motor-Cars at Lloyd's," for which he claims the advantages of no compulsory arbitration or cancellation clauses, while reduction on premiums are allowed in certain instances.

A NEW motor and cycle tyre and tyre repairing depot has been opened at 31, Brooke Street, Holborn, E.C., under the management of Mr. W. G. Weston, who will have a stock of motor-tyres with square and round treads, manufactured by the Avon India Rubber Company, Ltd.

MESSRS. J. AND R. OLDFIELD, of Warwick Street, Birmingham, recently invited us to witness a demonstration of their "Dependence" electric head and side-light lamps.

These lamps give a clear road light of 100 yards ahead, and yet there is no fierce glare to contend with. The light runs parallel from the reflector direct to the road, and a diffused light spreads itself sufficiently to discern hedges on either side of the road. The makers inform us that the secret of the merits of these lamps lies in the lens and reflector, and, as they have a separate department devoted to the manufacture of optical instruments, they are in a position to produce a lens and reflector giving exceptionally good results. The chief points claimed for the electric lamp are a pure white light, perfectly clean,

cannot blow or jolt out, removable for examination of any part of the car without fear of causing a fire, and can be lighted immediately. The cost of burning is comparatively small; a 40-amp. accumulator will give a minimum of thirty hours' continuous light in four lamps. The "Dependence" lamps are well made throughout, and the company claim that their latest production in electric lamps is merely the outcome of years of experience in catering for the motor-car trade. Each succeeding year they have had to watch the development of speed and re-design their models to meet the new conditions thus created.

THE failure of Thomson's steam omnibus in this country did not deter Nairn from making an experiment in a similar direction, and in 1871 he attempted to maintain the "Pioneer" as a regular conveyance from Edinburgh to Portobello. He, too, was unsuccessful, although during the summer the omnibus made nearly 1,000 runs, carrying an average of twenty-one passengers each journey.

DURING the progress of the forthcoming motor and cycle shows Messrs. Harvey, Frost and Co. will hold practical demonstrations of their H. F. vulcanisers at their establishment, 39, Great Eastern Street, E.C. There they will also show a new auxiliary appliance for use with the vulcaniser, which, in addition to the curing of superficial defects in tyre covers, will also make good any weakened, decayed, broken or burst fabric in the foundation of the cover. This appliance can be adapted to the "Car" vulcanisers without any alteration whatever.

MESSRS. CROSSLAND, WASS AND CO. are hiring out for their garage in Cardiff 14-h.p. cars for daily use.

MESSRS. DUCROS MERCEDES, LTD., have just sold a 70-h.p. Mercedes four-cylinder chassis to Lord Alwyne Compton.

WE hear that Messrs. T. Burton and Co., motor engineers, Blackburn, are experimenting with a new paraffin carburettor.

THE Society of Motor Manufacturers and Traders has decided not to proceed further with the agency scheme set out in the draft circulated previous to the meeting on the 10th ult.

WE learn that Messrs. Dennis Bros., Ltd., have been successful in securing an order for the Royal mail vans for service between Dereham, Fakenham, and other outlying districts around Norwich.

WITH reference to the system of street watering by motor-vehicles which Messrs. Trackson, Bros., Ltd., have introduced to the authorities of Brisbane, it is calculated in the colony that the cost will be 1s. 6d. per mile sprinkled.

THE new catalogue of the Dook-Swain Tyre and Rubber Co., Ltd., of the Soho Tyre Works, Pollard Street, Manchester, will be of value to all who are interested in the tyre question. Their beaded-edge tyres are being made in two patterns, "Standard" and "Special," the latter being a particularly flexible, resilient, and durable type. The section of this which has been submitted to us is proof of the superfine quality of the rubber employed. To this "Special" tyre the Dook-Swain metal-studded non-skid can be fitted, while the firm also undertake the re-treading of tyres. Another department of the Dook-Swain Co.'s activity is that of accessories, in which they have several specialities, including a combined petrol pourer and sieve, by means of which any tank can be filled without waste of petrol or risk of fire. A short length of flexible tubing is provided, so that tanks inconveniently placed can be reached with ease. This tubing is detachable, and the whole appliance can be packed away in a very small compass—a matter of importance when many things have to be carried and space is limited. The device screws on to the petrol can, a straight tube reaching to the bottom of the tin, through which passes the necessary air to take the place of the outgoing petrol. Well made and designed, the Swain petrol pourer and sieve is one of those simple little accessories which should be found in the equipment of every motorist, while it should be regarded as indispensable in garages and places of trade.

As an adjunct to the equipment of the motor school the new device in the Victoria Street Garage, 94, Victoria Street, S.W., is a desirable and useful appliance. It will secure to the pupil some degree of experience ere he is cast adrift in traffic, there to manipulate his car to the danger, more or less, of other users of the road. We recently saw a demonstration of the attributes of this "mechanical instructor." The pupil was seated in the motor-car with the engine running. The car, however, was stationary, its front axle being raised on a screw-jack, while the rear wheels were mounted on a set of rollers securely anchored to the floor. By the side of the car stood the instructor, a double dial with levers under his hand. On the wall facing the car were two dials, one having two pointers, black and red, similar to the hands of a barometer, the other with a single digit. The two combined were practically "the road" which the pupil in the driver's seat was watching. One dial is divided into sections representing conditions which the driver of a car would expect to encounter, such as "Slow Traffic," "Road Clear," "Dangerous Crossing," "Traffic Stopped," &c. The other dial with the two hands represented the course of the road to be followed by steering. Manipulating the levers the tutor was able to produce the conditions of actual travel, calling upon the pupil to stop, to avoid obstacles and carry out the various operations necessary in such contingencies. One of the levers in the control of the instructor produced the conditions of hill-climbing, its application being detected only by the ear or sense of feeling on the part of the driver, who thus learns when it becomes necessary to change gear. Altogether the device is useful as accustoming the novice to the handling of the car without being actually on the road, so that when he really encounters traffic he knows exactly what to do to avoid danger.

## LUBRICATION IN COLD WEATHER.

THE winter season is now rapidly approaching, and motorists will be well advised to be fully prepared with regard to the extra care needed to keep their cars in proper running order during the periods of cold weather that may be expected. A first and foremost point to which attention may be drawn is that of the danger of burst cylinders and radiators due to the freezing of the water in the jackets, the usual method of obviating this being to either keep the vehicle in a heated stable or to add glycerine to the circulation water, or, as a last resource, to drain off the water from the radiator cylinder jackets when the car is put away for the night. Another matter which will require consideration is that of lubrication. Motor oils usually increase in viscosity very considerably when subjected to cold, and under extreme conditions may become semi-solid and incapable of flowing, except when under the influence of great pressure. Unless the means of feeding the lubricant to the various bearings be absolutely positive, or the lubricant supply and the feed pipes are so located as to benefit from the heat developed from the engine, there is in very cold weather no certainty that

## SOME USEFUL NOTES.

ALWAYS see that your spare parts—especially the valves—are of the proper size for the engine, so that there may be no annoying delay if they should be suddenly called into requisition

SOME motorists, when adjusting their chains, do not seem to realise that there is a correct position for the shackles on the back scroll. The top of these side-plates, or shackles, should always be leaning away from the hollow of the scroll.

INLET valves do not get nearly as hot, and consequently do not expand as much as exhaust valves. For this reason less clearance should be allowed between the stems and push-rods of mechanically-operated inlet valves than would be allowed between the stems and push-rods of exhaust valves.

INASMUCH as the springs on mechanically-operated inlet valves are usually weaker than on the exhaust valves, the wear on the parts which move them will not be so great. Another

Mr. H. R. Pope at the wheel of the 100-h.p. Itala he drove at the recent Race Meeting at Blackpool.

oil is being properly distributed. Many, if not most, mechanical lubricators are sufficiently positive in their action to force the lubricant through a small and exposed pipe, even though the oil be rendered very viscous through cold. The oil in the lubricator reservoir must, however, be sufficiently fluid to allow the pumps to fill and operate properly, and hence the reservoir should be so located as to be under the influence of the heat from the motor. In any case, to ensure efficient lubrication in winter a high degree of watchfulness should at all times be maintained.

FROM Mr. S. F. Edge come a couple of very interesting photographs, one of which depicts the erecting shop at the Napier Works for six-cylinder cars. Large as is the department, a new chassis erecting shop, which covers a greater area than the whole of the machine shop shown in the photograph, is already in operation. Three years ago the ground at Acton on which the works and machinery now stand was only a field, while to-day about seven acres are covered with buildings, in which over 1,200 men are employed in the manufacture of Napier cars. The second photograph is that of a very large group of the employees taken at the lunch hour; it illustrates in striking fashion the important position the construction of automobiles is assuming among British industries.

reason why the wear is less is that there is no pressure on the inlet valves at the instant when they are lifted, while the exhaust valves may have forty or more pounds pressure to the square inch on them at this moment.

IN the case of a motor the cylinders of which may be somewhat worn and the piston rings slightly reduced in size or of imperfect fit, there is likely to be a serious escape of the charge during the compression stroke, with a consequent lowering of the pressure of explosion, and also a considerable escape of the burning charge during the power stroke. This is particularly the case when the motor is started after it has been standing some time and is quite cold. The cylinders themselves are maintained at a comparatively low temperature by the cooling action of the jacket water; but the pistons and their rings have much less opportunity to give up the heat imparted to them by the explosions, and consequently are at a higher temperature than the cylinder walls. After being run a short time the pistons and their rings become expanded more than do the cylinders and fit the bore much more tightly than when the engine is cold, thus reducing the escape of gases during the compression and power strokes and adding to the useful output of the motor.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
87-88, Charing Cross Road, W.C.]

### RULES OF THE ROAD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been a driver of horses almost daily for a period of twenty-five years, a rider of cycles for about twenty, and a motorist for six years, and therefore may claim to know something of the rules and amenities of the road. As a result of this experience I am convinced that, properly driven, a motor-car is the safest vehicle on the road, and, moreover, one that can be stopped in less than half the distance of a horse-drawn vehicle. Surely it is not beyond the wisdom of Parliament to deal with fast driving in such a way that it would soon be stamped out without injustice to the careful driver, who is usually the man of moderate means. I have been much struck with the evident prejudice and animosity against motorists on the part of some of the correspondents in the daily Press of late. The opinion of these is worthless. On the other hand, some motorists in their letters have shown a levity which all moderate thinkers must deplore. These latter cause all the trouble.

The advocates of taxing motors off the road forget, or do not care, how much injustice is done to the considerate driver. They would punish the men of moderate means without reaching the road-hog. There are owners and chauffeurs, unfortunately, who care nothing for the pedestrian, the horse driver, the cyclist, or the motorist. Punish these as severely as you please, but spare the innocent.

We want a law compelling every rider and driver to keep to the left, or near side of the road, not only on passing, but always. Now that our electric cars do from ten to twenty miles an hour (by-the-by, passengers in these cars never object to the speed) cyclists about the same speed (these often pass me in my car), and motors ditto, it is imperative that the rules of the road should be more explicit and should be enforced against all. As mayor of Portsmouth for two years, I made efforts to bring about a better observance of the existing rules, but I fear with little effect. Our chief constable is now, by an arrangement of constables at dangerous corners and at cross roads, making an effort to educate drivers to the proper use of the roads. Many motorists and some others should not be allowed to drive. The scorching motorist may be weeded out if magistrates would exercise the powers they possess by suspending the driving licence for six months or for a year. A paid driver would then run the risk of losing his living for a time, and would obviously be more careful. The punishment to the owner who drives would be a wholesome deterrent. If, after a period of suspension, either should offend again, imprisonment would be effective.

With reference to dust, retain the twenty-mile limit by all means for the country. It is fast enough to be safe on our English roads. Locally I drive a small car, and for country drives, and professionally sometimes, a larger one. As a result of careful observation I find that a speed of over twenty miles an hour increases the volume of dust enormously, but under this speed, on a fairly good road, the dust is not more objectionable than that raised by a carriage and pair. It should be remembered that all road users raise dust, and a coach and four raises more than a car driven at a moderate speed. If coaches with four horses were common, would those who now complain advocate taxing them off the road? In pictures of the old coaching days one sees clouds of dust represented, and it was the custom on the main routes to have pumps at certain distances for road-watering purposes. Cars with smooth tyres do not make dust. The damage is done by horses; and cars and bicycles simply raise it more or less. It is due to our local authorities to say that the roads were never in better condition than they are to-day. That they will be still more improved in the near future there can be no doubt.

The police trap is an abomination, because often the innocent are summoned, and the guilty, who go at such a speed that the numbers cannot be seen, escape. Speedometers should be attached to all cars. I find mine a great comfort. Insurance, especially third party, should be illegal.

Some writers advocate the fixing of speed limits by local authorities in their several districts. The result would be chaos, and no driver would know the limit in any district he might enter. With reference to accidents, in my town, with over 200,000 inhabitants—and in the season 250,000 people—only one fatal accident has occurred since the advent of the car, as the result of a collision with a pedestrian. This was accidental, and due to the hesitancy of the latter. Several have been killed by trams, and many by horses, in the same period. The latter are not, however, so prominently recorded in the newspapers. The chief constable informs me that minor accidents due to cars have been very few indeed. The worst offenders in the matter of speed are the week-end people; and I have stopped two and remonstrated with them only recently.

Our manufacturers are just wresting from the foreigner the business, which hitherto was almost a monopoly with the latter. To tax cars in a vindictive spirit would cause men of moderate means to give up keep-

ing them and would prevent others from purchasing. The consequences in these times of unemployment would be deplorable.—Yours truly,  
T. SCOTT FOSTER.

### THE QUESTION OF SPEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am pleased that my letter should be deemed worthy of a reply from Mr. A. I. Hickman, but must certainly take exception to his proposed panacea for speed driving. I think we are taxed and licensed quite enough now without having to carry about more paste-board, to say nothing of the inevitable fee we should have to pay. Twenty miles an hour may seem slow when on roads hundreds of miles long, as are found abroad; but the distances between places in England are so short that every mile or two one comes across a village, hamlet or farm which calls for the greatest caution.

I must adhere to my ideas that I have held ever since the craze for speed became rampant, that the only remedy is to mechanically fix the rate; this will do away with any further examination, and a lot of hard swearing in case of mishaps. There are many victims to speed who would have been alive to-day if they had taken "Festina lente" for their motto.—Yours truly,

W. J. W., A 1299.

Touring in France.—The Cathedral of Saint Jean, Lyons.

### THE DEVELOPMENT OF THE MOTOR CAR MOVEMENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with very great interest your article on the "Development of the Motor Car Movement, 1896-1906," in No. 399, of the 27th October, but I must take exception to the following lines on page 745:—"While the efforts of Messrs. H. J. Lawson and F. R. Simms, in connection with the Motor Car Club, which they founded, were directed towards catching the public eye."

The facts are briefly and as correctly recorded in the "International Review," No. 6, of June, 1904, giving my biography in connection with the motor-car movement, viz., that on the 15th October, 1895, I suggested to Sir David Salomons, in the presence of my friend, the Hon. Evelyn Ellis, after dinner, at Broomhill, the residence of Sir David, that "a Self-Propelled Traffic Association" should be formed, and for which I had already framed the general outline, rules and constitution. Sir David Salomons, however, took the matter into his hands, and established the Association himself. This independent action was really the reason for the formation of the Motor Car Club, entirely conceived by myself. When I saw, however, that the Motor Car Club, which seemed in a fair way to meeting with success, was being mixed up with questionable trade interests, I retired from the

said club, and it then became my ambition to start an independent members' club, which should be thoroughly representative of the automobile movement. I here refer to the Automobile Club of Great Britain and Ireland, of which I am proud of having been the founder.—Yours truly,

FREDK. R. SIMMS.

### ROAD SIGNS AT NIGHT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you allow me to draw the attention of your readers to the great, though not as yet widely recognised, necessity for illuminating road signs and finger posts on country roads at night?

About a month ago, whilst driving a car from Winchester to London after dark, I narrowly escaped an accident. Shortly after crossing over the railway on the way from Farnham to the Hog's Back, the main road takes a sharp turn to the left, which, as the night was very dark and a fine drizzle was falling, I could not see until I was right on the bend. Not knowing the road, I kept straight on where I could see an opening in the hedge in front of me, and after applying both brakes pretty sharply, pulled up in a narrow cart track, out of which I had considerable difficulty in reversing, owing to the darkness and proximity of a ditch.

Another bad corner is that at the entrance to Bagshot village, just past the "Cricketers' Arms." One day last week I was being driven along the road by a man who did not know it, and, had I not warned him, we certainly should have had trouble, as the car was a heavy one

A party of young Scots on their way to school from Langholm (Dumfriesshire) to Westerkirk. The distance between the two places is seven miles, the children being conveyed to and fro (morning and night) by motor-wagons. In order to cheapen the cost of conveyance to the local authority the wagons are utilised for the carriage of goods between the two points.

[P. L. Glendenning.

and we were travelling about 18 miles an hour. All who know this corner will remember the abrupt curve of the road leading to the narrow bridge at the bottom of the hill. I cannot remember if there is a red triangle to denote this point, but if there is, it certainly is not sufficiently prominent to catch the eye of a driver, who must keep his eyes glued to the road on a dark night.

I simply take these two as instances of the many dangerous corners there are on main roads.

Now, if proper signs, after the manner of those used in France and America, which indicate the nature of the danger, were placed at such spots as I have described, and illuminated at night, travelling would certainly be safer, and the driver relieved of a great deal of anxiety.

Then there is the question of discomfort and loss of time to be considered, for one is compelled to frequently stop and examine the finger posts, often half buried in a hedge, by the light of a lamp, detached from the car.

Who is going to undertake this scheme, which I feel convinced would be the greatest boon to all users of the road?

Now that the alteration of the law respecting motors is under consideration, some action might be taken to compel local authorities to illuminate signs in the districts under their control.

There is, I believe, some rumour that one of the associations, which has been formed for the object of rendering assistance to motorists, "has the matter under consideration," but nothing practical has yet

been done, and this is just the time of year when the illumination of signs is most necessary.

I would suggest that if the matter cannot be adequately dealt with at once, a body be formed for the purpose of:—

(1) Illuminating all caution and danger signs.

(2) Erecting better signboards on the main roads from London, which would face the driver instead of lying parallel with the roads, thus making them far easier to read.

Take, for instance, the road to Brighton. At all points on the road at which the route was not perfectly straightforward a sign would be erected, something after the following:—

BRIGHTON	36 M.
Redhill	5½ m.
Crawley	6½ m.

It would be necessary to secure the co-operation and support of all users of the road, as the initial cost of erection would be considerable, but, doubtless, the scheme could be elaborated so that contributors would receive other benefits.

The signs could be illuminated by petrolite lamps. It would be interesting to hear the opinions of other motorists on this subject.—Yours truly,

E. T. WRIGHT.

### BLOCKED CARBURETTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Those who have read any of the many detailed reports of the recent Tourist Trophy Race cannot but have been struck by the large proportion of the competitors who claim to have suffered delay owing to a choked carburettor, caused, presumably, by the presence of some foreign substance in the petrol. It is fair to assume that in every case quite exceptional precautions had been taken, including very careful filtering when filling the tank, to ensure the cars going to the post in the most perfect state possible, and it is, in fact, a matter of common knowledge that no stone that could be fairly turned was left unturned by owners and drivers to have their cars in the highest possible state of efficiency for this important event. In view, therefore, of the failure of the carburettor, in spite of the care taken, it will doubtless occur to the ordinary everyday motorist that when the pick of the trade, supported by the most skilled drivers and mechanics, cannot avoid such difficulties, it is hopeless for him and his kind to expect to escape, and he will accept these annoyances as among the unavoidable but unpleasant experiences of a motorist's career, and continue to rely upon careful straining of the petrol when filling his tank to escape similar stoppages.

This is, of course, a very necessary precaution, which should never be missed; but, unfortunately, no matter how carefully performed, it is never a thorough preventive of certain foreign particles still finding their way from the tank to the carburettor and choking the spray jet. How this solid matter is produced after such careful straining is to most a mystery, but we may point out that there is undoubtedly some chemical activity set up in the tank by the action of the petrol on the metal which induces a certain deposit to be formed in the tank. The only way, therefore, to deal with this is to strain the petrol a second time after it leaves the tank and before reaching the carburettor. If this precaution is taken we do not think a choked carburettor will be likely to trouble the motorist, no matter what type of petrol car he may control.—Yours truly,

E. M. BOWDEN'S PATENTS SYNDICATE, LIMITED.

### RAILWAY LEVEL CROSSINGS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having noticed in the *M.C.J.* that you have mentioned several instances where accidents and narrow escapes at level crossings have occurred, I wish to draw your attention to the level crossing at Crawley, on the main London and Brighton road, to see if the unsatisfactory state of things that now exists cannot be remedied before any lives are lost. On the evening of the 3rd inst., about six o'clock, I witnessed what might have proved a serious accident, had it not been for the promptness of the driver of a motor landaulet applying his brakes, owing to the gates being across the road, with two lamps on, but scarcely visible until he was right upon them. Should this meet the eye of the particular driver (who, whilst he was waiting for the train to pass, had one of his passengers alight and enter a shop adjoining them) possibly he will substantiate my statement about the lights. Some few weeks ago a gentleman passing through in the night ran into the gates with a motor-cycle (through the insufficient lighting) breaking two pieces of timber off the gates but fortunately without serious personal injury.

The Motor Union should bring this long-existing trouble to the notice of the L. B. and S. C. Railway Company. The bad situation of the signal box, from which the man in charge cannot see on the Brighton

side more than a few yards, is another difficulty. Being unable to see the road for a longer distance, the signalman has sometimes thrown the gates over the roads, and thus caused several cars to pull up very sharp to avoid accident. If the box were moved to the opposite side of the road the man in charge would have a clear view of both ways, and possibly something could also be done to the benefit of the travelling public.—Yours truly,

H. K.

### BENZOLENE AS FUEL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the year 1897, and for some years afterwards, I employed ordinary commercial benzolene as fuel for motors, and can see no reason why its use should not be continued. The price never exceeded 7½d. per gallon, delivered in ton lots. To show how efficient it was as fuel, reference should be made to the report on the Trials of Self Moving Vehicles at Birmingham in 1898, conducted by the Royal Agricultural Society of England—see the Society's Journal, Volume 9, part 3. In these trials, the machine I was responsible for was run with this fuel, and the following figures, taken from the judges' report, clearly shows how efficient it was:—

Total weight of car and load	...	...	2.49 tons.
Cost of fuel per mile	...	...	0.49 pence.
Cost of fuel per ton per mile	...	...	0.18 pence.
Cost of fuel per ton per cargo per mile	...	...	0.465 pence.

—Yours truly,

J. S. CRITCHLEY.

### THE TENTH ANNIVERSARY OF THE EMANCIPATION OF THE MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are instructed by our committee to acquaint you of a change in the original programme as notified you, which we trust will enable you to participate in the celebration. A goodly muster of pioneers is already assured, but our committee desires that no eligible gentleman shall be absent except for reasons of an unavoidable nature. In the first place, several gentlemen who rendered good service in the early days are prevented from joining the function as originally arranged, owing to the opening of the Olympia Show having been fixed for the day following. Again, neither the traditional route nor starting place are available on the 14th inst., owing to the projected visit of the King of Norway to the Guildhall.

It has therefore been decided to limit the official programme to a luncheon in the Balmoral Rooms at the Trocadero Restaurant, W., at which Sir David Salomons, Bart., will preside.—Yours truly,

CHAS. JARROTT } Joint  
C. MCROBIE TURRELL } Hon. Secs.

### A DOCTOR'S EXPERIENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read from time to time in your valuable paper different opinions as to the use of a motor-car in a doctor's practice. At the beginning of August, 1905, I went to our local motor agent, Mr. A. E. Pettifer, and asked his advice as to a motor-car for my work. He said he was prepared to loan me a car for one month's free trial, and if I found it answer he would undertake to find me a car and keep it in thorough running order for £115 a year, I to find petrol and oil. I tried it, and struck the bargain for twelve months. I sold three of my horses, keeping one in case of any breakdown. I have used this car continually day and night, doing an average of forty-six miles a day, and am pleased to say have never had ten minutes' delay from any breakage, beyond a few punctures. I have worn out two sets of tyres and have nearly finished the third. I must say before I had this car I was out morning, noon and night, very seldom getting a few hours at home; now I do the journeys in half the time and at half the cost, although my practice is situated in one of the worst districts in England. The little car has never faltered, and more than once I have climbed the noted Froome's Hill twice in one day. The little car, a 6 h.p. Wolseley, is not the quietest, but I should say for reliability is second to none. I am in my second year and it is running as well as ever.—Yours truly,

SATISFIED DOCTOR.

### MOTOR-CAR CARRIAGE TO THE CONTINENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The matter of charges for conveying motors to the Continent is one that is doubtless of great interest to many of your readers. The South Eastern and Chatham Railway Company charge £5 5s. for taking a car from Folkestone to Boulogne, carriage from London extra, but I have been able to send my car from London to Boulogne for only 30s., and from Brussels to London for a like sum. Recently I bought a second-hand car and later despatched it by the Bennett line of steamers from London Fridge to Boulogne, passed it through the Customs, and paid my deposit—so much per 100 kilos. Car weighing 610 kilos (between 12 and 13 cwt.)—the deposit was about £12 5s., after which I took up my three passengers. I ought then to have driven to

Arras, there to pass an examination in driving and to be licensed to drive and to have a plate fixed during my stay in France. As I had not intended taking Arras in my itinerary, and not feeling too certain as to my ability to pass a Government inspector as an expert in driving, I gave Arras "a miss," driving from Boulogne as follows:—Montreuil, Abbeville, Amiens, Compiègne, Rheims; we left there for Charleville-Mezieres, this was the first stopping place in the Ardennes on the way to Givet. Between these two places our little car took us to the topmost point of the Ardennes. At Givet, the French and Belgian frontier, I received my deposit back, and by rights should have paid customs before entering Belgium, viz., 12 per cent. on the value of the car, and again being served out with a permit and a number plate. The house where I should find the gentleman who would take my money and give me the permit was indicated to me by the frontier official, but, losing my way *en route* to it, I neither paid customs nor obtained a permit, but continued my drive without either, reaching Dinant in time for tea, where we stayed the night. The next morning, off to Namur and thence to Brussels, which we reached at the close of the afternoon. I there learned that the road to Ostend was quite impossible *pavé* the whole distance, so put my car on board the City line of steamers for London, the charge from Brussels being, on this line, the same as Bennett's to Boulogne, viz., 30s.—Yours truly,

C. M. HOLLOWAY.

### AUTOMATICALLY-CONTROLLED IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the correspondence on this subject, I cannot say that I uphold the method of controlling the throttle and advance spark by one lever. There are occasions when you may want more or less gas without interfering with the timing of the ignition, and *vice versa*. On my 14-20 h.p. Vinot car the throttle is handled through the medium of

The Daimler 'Bus recently supplied to Viscount Boyne. It is of 28-h.p. and has a wheelbase of 11 ft.

the governor, and speed can be regulated on this car by this method to a nicety, whereas I scarcely ever find it necessary to alter the timing of the firing, as when the speed of the engine is too low for the timing as placed, to be suitable, it is really an advantage to change down to a lower gear. Of course there is no trouble in changing speed on this car, owing to its being fitted with a vertical gate arrangement, the nicest and sweetest change-speed I have ever used.—Yours truly,

ALAN A. L. HICKMAN.

W. T. B. is informed that the offices of the Automobile Association are at 18, Fleet Street, E.C.

THE "RADIO" SILENCER.—In reply to "W.," Messrs. Wood and Co., of Ashton-under-Lyne, are the makers of the "Radio" silencer.

SOCIETY OF AUTOMOBILE MECHANIC DRIVERS.—We are asked by the secretary to announce that a meeting of those interested in this society will be held at Rawlings' Garage, Halkin Street, Belgrave Square, S.W., on the 26th inst., when important business will be discussed.

A MOTORIST who lost a motor axle wheel cap bearing the name of the Relyante Motor Company, Walthamstow, on the road between London and Wallington (Oxon.) will be glad if the finder will return it to the makers.

FOREIGN LAMPS AS BRITISH.—Messrs. George Polkey, Ltd., call our attention to the fact that foreign lamps bearing no name are being sold as British. In the case of their lamps they would remind readers that they bear the name of "Polkey"—without which none are genuine.

MR. H. W. SOUTHALL, jun., 7, Union Passage, Birmingham, writes:—"It has come to my knowledge that a rumour is being circulated to the effect that there is an injunction pending against me in respect of the patents under which I manufacture and sell the Southall Tyre Gauge. I am writing to you to strenuously deny this and to advise you that it is absolutely untrue. There has been no injunction obtained, neither is there one pending."

## PRECAUTIONS FOR SAFE DRIVING.

THE following suggestions are made in the interest of safety and comfort in driving, and as an assistance to the novice-motorist in getting the most out of his car with the least expenditure of fuel and a minimum of wear and tear. Safety in operating rather than speed should be the prime consideration in motor driving, and every motorist can assist in placing the reputation of the motor-car in this respect upon a firm foundation.

As all petrol cars create a certain amount of noise as long as the engine is running, whether or not the vehicle is in motion, the driver has largely to rely upon his sense of sight. This fact demands an especial amount of visual alertness on his part. When approaching an intersecting road the view of which is cut off by buildings or otherwise, he must have his car under perfect control, as he will not be warned by the noise of intersecting traffic so effectually, at least, as is the horse driver. In crossing a tramway line at an angle the only safe course is to take a backward as well as a forward look for approaching cars. When driving in districts where the motor-car is unfamiliar, the problem of meeting and passing horses becomes a serious matter, and results in the unpleasurable consumption of much nervous tissue on the part of all concerned. One rule bearing upon this phase of motoring which may always be profitably observed is this: Never allow yourself to infringe the rules of the road or the prevailing law or regulation in regard to stopping on request or as to speed. It is of

legitimate to pursue your regular legal pace until some sign of fright is noted, when the speed should be decreased and the car stopped if necessary. The engine may be shut down if it seems needful, but if it is possible to get by without taking too great chances, it is almost always advantageous. When the car is past the horse, it may be speeded up in order to get out of hearing as soon as possible. Any signal to stop on the part of the driver should be obeyed as quickly as the brakes permit. When horses are met driven by ladies or children and there are the slightest indications of fright, the car had best be brought to a full stop, and one should wait, with hand on the switch, ready to stop the engine instantly, unless the animal is under full control. Under all circumstances, the motorist should speak to any horse which appears frightened. Such action on his part, in conjunction with the efforts of the driver, generally proves effectual.

Sometimes, even when the vehicle is stopped and the engine motionless, a horse cannot be induced to pass the car. There is only one thing to do in this case, and that is for the automobilist to lead him by. This gives one an opportunity to say a few pleasant words to the occupants of the vehicle and perhaps relieve the situation.

Country roads are often very narrow, densely wooded on both sides, and have very sharp curves. These curves should be rounded with the car under perfect control and the horn should be sounded well in advance. Night driving over roads of this description is more picturesque and exciting than safe and restful. One interesting fact is that horses will hardly ever start to run away when confronted by the

General View of the German Motor Car Exhibition at present being held in Berlin.

the greatest advantage in case of trouble to feel that you were well within your rights.

It appears to be not so much the noise of the motor-car that frightens the horse as its "horselessness." In the dim equine intellect, the motor car doubtless savours of the supernatural and his fear is correspondingly unreasonable and uncontrollable. When passing a restive animal, the voice is very effective as a quieting agency. Such expressions as "Whoa, boy," "Easy now," said in a reassuring tone, seem to have great influence, and evidently relieve the situation of its supernatural element, as judged from the equine standpoint. Experience has shown that ordinarily the best manner in which to pass a standing horse headed in the same direction as the car is to cross to the extreme further side of the road, and drive by about as quickly as the law allows, but never faster. The car is soon past the animal and he will seldom start to follow the cause of his fright and rarely will back, because the car and its terrors are rapidly drawing away from him.

Passing a standing horse headed in the opposite direction, the animal has a full opportunity to see the car approach and work up his nervous tension, and rather more care is necessary. The quietest gear should be retained, if possible, and the car should be slowed down to its minimum—in every instance below the legal limit, and one should approach on the extreme opposite side of the road ready to throw out the clutch and switch off the ignition at the least exhibition of dangerous quietude.

In meeting a horse being driven by a capable driver, it is perfectly

acetylene lamp of a motor-car. The horse is evidently completely dazed and somewhat stupefied and ordinarily will not move. How dazzling the huge acetylene projectors of modern cars are to the occupants of horse-drawn vehicles we of the automobile fraternity can probably but dimly imagine. There is certainly such a thing as carrying too much light on a motor-car so far as the comfort of traffic in general is concerned.

The motor horn, too, may, considers an American writer, be perverted from a valuable instrument of warning to an agency of offence. It is intended to notify the drivers of other vehicles of one's approach, and not as an advertisement to the community at large that one has a motor-car. The excessive use of the horn has, in some districts, done more to create a feeling adverse to motor-cars than almost any other feature of the movement. The horn must, of course, be used in accordance with the law, but it is entirely unnecessary to go "tooting" through the open country to the useless annoyance of everyone within earshot. The horn's legitimate use is to notify traffic of the car's approach when otherwise it would be unaware of the fact. When about to pass a horse-drawn vehicle going in the same direction it becomes really necessary to warn the driver of the other vehicle by sound that one is approaching, as the sense of sight will not advise him. In fact, the horn is only intended to notify people of the vehicle's approach who would not be likely to learn of it through the sense of sight.

When meeting or passing trams when they are either moving or stopped, the automobilist should use especial care, as at any instant a

passenger may jump from the tramcar directly in front of the motor vehicle. The noise of the tramcar drowns the sound of the approaching automobile, and people do not always "look before they leap."

The driver of a motor-car, who always occupies the driving seat and has the support of the steering column, seldom realises, until he tries it, the discomfort which he imposes upon the occupants of the tonneau seats, in passing over crossings and gullies at a high rate of speed. A few rides in the tonneau, behind a speedy driver, will be likely to make him more considerate in this feature of his driving. In turning corners, too, the tonneau passengers have the full benefit of the slue which accompanies high speed under these conditions. The throttle and spark control of every car ought to be so adjusted as to admit of low speed being instantly realised when passing over "bumps" or turning corners, so that they may be traversed without unnecessary discomfort.

### RECENT IMPROVEMENTS IN ACCUMULATORS.

At a meeting of the Society of Engineers held on Monday last, a paper was read on "Recent Storage Battery Improvements," by Mr. Sherard Cowper-Coles, Assoc. M. Inst. C.E., M.I.M.E., M.I.E.E. The author first referred to the comparatively small advance that has been made with the lead accumulator of recent years, although the industry is of considerable importance, the annual monetary output for storage batteries in England and Germany being estimated at nearly £1,000,000, so that any economies effected in the life or manufacture of accumulators would be of great importance to the commercial world, irrespective of the new fields of application it would open up. The nickel iron cell was referred to, and a typical discharge diagram given as compared to a lead accumulator. Ignition cells for firing petrol engines were then

A Yorkshire 5-ton Steam Lorry which is used exclusively for furniture removing. In nine months the machine has travelled over 5,000 miles, carrying every journey a lift van and trailing a pantechnicon, as shown in the illustration.

considered, and their advantages and disadvantages enumerated as compared to the magneto machines, and figures were given showing that the motorist, in having an ignition cell charged, paid for the labour and convenience and not the electrical energy. Efficiency being of minor importance, it was maintained that primary batteries with reversible electrodes would be cheaper than storage batteries. The defects of the negative pasted plate were then considered, and the author stated that, in his opinion, the deterioration in the negative active matter was due to the fact that sulphate of lead is soluble in strong sulphuric acid. The author carefully traced the reaction which takes place in a negative electrode during charge and discharge, and showed that the concentrated acid within the plate is the medium for the continual transference of matter from the interior of the plate to nearer the surface, thus clogging up the pores and preventing the access of electrolyte to the interior. The author then gave an historical sketch of the accumulator as far as relates to cells of a compact nature, and to electrodes that retain a large quantity of the electrolyte within themselves, and therefore have not attenuated pores, but in which the active matter itself is not necessarily porous, under four headings:—1. Solid cells, in which access to electrolyte is not provided for. 2. Cells of the "multiple-unit" pasted-plate type, in which an attempt is made to deal with the electrolyte difficulty. 3. Cells without plates of the solid network type, in which the solidity of the cell and access of active matter to electrolyte are both dealt with. 4. Cells without plates of the solid network type, in which the electrodes consist of non-conducting networks covered with a film only of active matter. After directing attention to the various stages of development of the network type of cell, the conclusion arrived at by the author was that immediate future developments would be in the direction of electrodes which contain the electrolyte within themselves.

## CASES UNDER THE MOTOR-CAR ACT.

### SECTION 1.—RECKLESS DRIVING.

At the Sheffield Police Court, Herbert Walker was summoned on two counts, for driving "at a speed" dangerous to the public, and for driving in "such a manner" as to be dangerous to the public. Mr. H. L. Coath, who prosecuted, said that the cases were brought under Section 1 of the Motor Car Act of 1903, which made it an offence for any person to drive a motor-car on a public highway recklessly or negligently, or at a speed or in a manner dangerous to the public, having regard to all the circumstances of the case. The two informations were laid as a matter of precaution because the High Court had decided that "speed" and "manner" could not be included in one summons, and it was sometimes difficult to decide under which head the offence was committed. By that section of the Act a man might drive at eighteen miles an hour at one time and not commit an offence against the law, but a few minutes later the traffic on the same road might be such as would make driving at a considerably less speed an offence. After hearing evidence the Chairman of the Bench said the Bench felt that they must impose a penalty that would be a deterrent against such offences. The police had done quite right in bringing the prosecution. As there was nothing against the defendant before, they imposed a penalty of £10 including costs, or a month in default. Perhaps that would act as a warning to other reckless drivers.

Sir Thomas Lipton's chauffeur has been fined £5 and costs for reckless driving near Coventry. The motor-car, in trying to pass a wagon, overturned, and the five occupants were hurled into the road. A Fulham man named Mulholland, one of the passengers, was killed. Notice of appeal was given.

### SECTION 9.—THE SPEED LIMIT.

Eleven motorists have been fined at the Kingston-on-Thames County Petty Sessions a total of £61. One of the defendants was a lady, the speed of whose car was given as thirty miles an hour. She was fined £5.

Two motorists have been fined at Newmarket for exceeding the legal limit on race days when there was much vehicular traffic on the road.

In a charge of exceeding the speed limit brought against Mr. Theodore Conolly, at Kingston, the evidence of a speedometer has been successfully pitted against the police stop-watch. Superintendent Marks said by his timing the defendant covered a quarter of a mile at the rate of thirty miles an hour. Mr. Conolly said that when he was stopped his speedometer registered just over fourteen miles an hour. This was admitted by Superintendent Marks. The Chairman said that on the evidence given it would be impossible to convict, and dismissed the summons.

Eight cases of exceeding the legal limit were heard at the Shoreham Petty Sessions on Monday. The fines averaged £4 except in the case of a motor-cyclist, who proved an alibi. He (Mr. S. Smith, of 126A, High Street, Tonbridge), was summoned for exceeding the speed limit with a motor-bicycle along the Upper Shoreham Road, at Southwick, on October 18th. He denied the offence, and Mr. E. Digby Gates defended. P.C. Marsh said defendant's speed was about 27½ miles an hour, and when his attention was drawn to the fact that he had overrun the constable (P.C. Legg) stationed to stop him, defendant remarked, "Your friend thinks I can pull up anyhow." Cross-examined, witness declared he was practically certain the defendant was the man stopped. He took the licence from his pocket. P.C. Brett, who gave the signal of the approach of the defendant, said he could not say whether defendant was the man or not, as the bicycle passed him at a high rate of speed. P.C. Legg, who stopped the cyclist, said defendant was very much like the man; he very much resembled him, but witness could not swear to him. The defence was an alibi, it being declared that defendant lent his cousin his motor-bicycle. The licence was kept in a bag attached to the back of the machine, and it was surmised that, looking in the bag for a spanner or something, his cousin found the licence there and put it in his pocket. Defendant gave evidence, and stated that his cousin, whose name was Thompson, and who came from Sheffield, mentioned he had been stopped. When witness received the summons he had communicated with his cousin, but had not heard from him, and therefore consulted a solicitor. After hearing evidence as to defendant's movements on the day in question, the Bench considered the alibi proved, and dismissed the case, but application for costs was refused.

### THE DANGER OF OVERHANGING TREES.

LATE on Saturday night a motor-car accident occurred at Burscough, near Southport. A party of four gentlemen was driving from Wigan to Southport, and when passing along a narrow lane bordered by trees one of the rear passengers, Robert Smith, of Wigan, was caught on the head by an overhanging tree and knocked out of the car on to the roadway. The car afterwards swerved and went through the hedge into a plantation. Mr. Smith was found unconscious, in a pool of blood, and was taken to a cottage close by and attended to by Dr. Heald, of Ormskirk, but died an hour later without regaining consciousness.

## CLUBS AND ASSOCIATIONS.

### MOTOR UNION OF WESTERN INDIA.

MAJOR BARLOW having tendered his resignation of the hon. secretaryship of the Union, as he is about to leave Bombay, Capt. L. T. R. Hutchinson, I.M.S., has been elected joint honorary secretary in his place. It has been decided to take a room in a central position as an office and members' room. The annual subscription has been reduced, and in future Bombay members will pay Rs. 20 and Mofussil members Rs. 5 per annum. Preparations are in progress for holding Reliability Trials at Christmas from December 24th to 31st, and it is provisionally proposed, subject to the sanction of Government, to start from Bombay and to run through Poona, Satara, Kolhapur, Belgaum and Dharwar to Hubli, returning by the same route. First entries, Rs. 50, close on November 30th, and final entries Rs. 75, on December 15th.

The committee have had the subject of tolls under consideration for some time past. Various proposals have been circulated to members for opinion, and it has now been decided to address the Government with a view of securing the abolition of tolls throughout the Presidency.

### LINCOLNSHIRE MOTOR CYCLE CLUB.

THE formation of the local centres of this club is nearing completion. A strong centre has been formed at Grimsby with nearly forty members, and Mr. E. Strutt, 78, Oxford Street, Grimsby, is local hon. secretary. At Spalding another centre has been established, Mr. W. Pollin being the hon. secretary, and the Red Lion, headquarters. On Thursday, last week, Mr. A. W. Foster, the chairman, and Mr. Wilkinson, the club secretary, went to Grantham, and a meeting was held at the George Inn, when it was resolved to form a centre. Many names of intending members were handed in to Mr. A. J. Mettham, 19, Market Place, the hon. secretary.

### MOTOR YACHT CLUB NOTES.

THE club dinner has been fixed for November 20th at the Savoy; the Vice-Commodore, Sir Boverton Redwood, will preside. The membership of the club continues to increase in the most satisfactory manner. The two hundred and fifty mark has now been well passed, and at the present rate of expansion the new year should see a good three hundred on the register.

A joint meeting of committeemen of the club and of representatives of the Society of Motor Manufacturers and Traders took place on Friday, October 26th, when several valuable improvements for the Motor-Boat Reliability Trials of 1907 were suggested.

### LINCOLNSHIRE.

THE committee of the Motor Union having accepted the invitation of the Lincolnshire Automobile Club to hold the 1907 May meeting at Lincoln, the club has elected a very strong committee to arrange for the reception of the guests.

The new rules for the club competitions have been drawn up by the committee. Among the more important is that which bars those in the trade from any club competition; but trials will be arranged in which all the members may compete. It is also proposed that no prize shall be accepted in which there are contests restricted to any particular make of car, or appliance or material.

THE annual dinner of the Southern Motor Club will be held on the 13th prox.

THE application of the Council of the Cyclists' Touring Club to the Chancery Division of the Law Courts to change the nature of the club is to be opposed by a number of the members dissatisfied with the recent decision.

### ROAD REPORTS.

ESSEX.—The water trough on the Epping main road opposite the Robin Hood public-house, owing to its position on the extreme edge of the road, has for a long time been the cause of great obstruction to both the Epping main road and also to the cross road leading from Loughton to High Beech. The committee of the Essex County Automobile Club set to work and ultimately obtained the necessary consent of the various authorities for setting the trough back twenty feet on to the forest land, the cost of such removal being defrayed by the club. No time has been lost in making the long-desired removal, and many thanks are due to the Essex County Automobile Club by all users of this road. The club has also been instrumental in obtaining the erection of danger triangles, &c., in various parts of the county.

NEWMARKET.—At a meeting of the owners of houses and training establishments on the Bury road, Newmarket, the following resolution has been adopted with a view to representations being made to the Local Government Board in favour of a speed limit being imposed:—

"That the maximum speed limit for motor-cars and all vehicular traffic be restricted to ten miles per hour from the end of the Bury road known as the Bury Toll Bar, to a point on the Cambridge road opposite to the boundary of the extension to the Newmarket Cemetery."

SURREY.—The Roads Improvement Association have been approached with a suggestion that it should acquire Mickleham Cottage, which is situated in Mickleham Village, at the corner of Dorking and Leatherhead roads. This corner is generally regarded as the most dangerous corner on all the Surrey main roads. The price asked is £3,000.

NORTHUMBERLAND.—It is stated, on the authority of Mr. J. A. Bean, the county surveyor of Northumberland, that two hundred miles of highway in the area will have to be re-made to meet the requirements of the heavy motor traffic. The roads there have practically no foundation and only a thin coating of metal.

### NEW COMPANIES REGISTERED.

YORK MOTOR GARAGE.—£1,000. Agreement with Mr. H. W. Kirby. No initial public issue. First directors, Messrs. H. W. Kirby (managing director) and G. B. Johnston. 1, Thornton Place, York Street, Marylebone, N.W.

SELBY MOTOR AND GENERAL ENGINEERING COMPANY.—£25,000. To adopt agreements (1) with T. D. Staggs and A. Jarman, (2) with Staggs and Robson, Limited, and (3) with E. Perkins, and to carry on the business indicated by the title. First directors, W. Rasdall, W. F. Morton, T. D. Staggs, E. Perkins, S. Robson, E. A. Jarman, and W. H. Coates. 1, Minster Gates, York.

AVERY AND ROBERTS.—£500. Manufacturers and retailers of tools and motor accessories, &c. First directors, P. N. Avery and G. Roberts. 64, Stanley Street, Liverpool.

MOTOR UNION INSURANCE COMPANY.—£100,000. Minimum cash subscription, £50,000. First directors (not less than four or more than seven), Earl Russell, Messrs. W. B. Jessopp, G. P. Turner, C. H. Dodd,

The Adams-Hewitt Mail Phaeton which was awarded a silver medal for easy manœuvring in the recent Town Carriage Competition.

and W. R. Jeffreys. Trustees of Motor Union of Great Britain and Ireland may appoint two directors. £1,000 per annum, divisible. 1, Albemarle Street, W.

LANDAULET MOTOR-CAB COMPANY.—£75,000. To adopt agreements (1) with Newfoundland Industries, Limited, and (2) with the Farman Automobile Company, Limited, and to carry on the business of proprietors of motor-cabs and other conveyances, &c. First directors, Messrs. C. Kusel, A. Pereno, H. Jones, A. L. Bersey, J. B. Roberts, G. Baggs, and R. W. Shepherd. 41, Coleman Street, E.C.

MOTOR PANTECHNICS.—£100. First directors, Messrs. W. Tattersall and B. M. Goode.

MOTOR PATENTS.—£600. To acquire an invention relating to an improvement in the manufacture of a vulcanising apparatus, having particular reference to the repair of solid or pneumatic motor, cycle, or other vehicle tyres and tubes, and to adopt an agreement with Messrs. G. W. P. Johnston and C. H. L. Alder. 110, Cannon Street, E.C.

MORECAMBE MOTOR AND ENGINEERING COMPANY.—£5,000. First directors, Messrs. F. H. Simpson, F. E. Hollings, and N. Walker. Heysham Road, Morecambe, Lancs.

DE WILTON AND BROMFIELD.—£5,000. To adopt an agreement between Mr. E. de Wilton and Mr. E. J. Gully for the acquisition of certain rights and benefits, and to carry on the business of stors and repairers of motors and component parts, &c. 4, Broad Street House, E.C.

CROSVILLE MOTOR COMPANY.—£5,000. To take over the business of a manufacturer of and agent for motors and other vehicles, carried on at Crane Wharf, Chester, by Mr. G. C. Taylor, together with leasehold premises held by him at Crane Wharf. First directors are Messrs. G. C. Taylor and C. W. Catt.

## THE PUBLIC AND POLICE TRAPS.

THE Lord Chief Justice and Justices Ridley and Darling, sitting as a Divisional Court, on Tuesday, heard an appeal which raised a question of importance both to motorists and the public. In March last Mr. Little was summoned by the police for obstructing them in the execution of their duty, because he gave warning to motorists that they were being timed over a portion of the London Road, Croydon. Mr. Little took the summons to the secretary of the Motor Union, and the Union instructed counsel on his behalf, with the result that the magistrates dismissed the summons. The police appealed upon the point of law, and obtained a special case, on which the Divisional Court pronounced judgment on Tuesday in favour of Mr. Little.

Mr. Danckwerts, K.C., and Mr. Bodkin appeared for the police; and Mr. Horace Avory, K.C., and Mr. Hemmerde for Mr. Little.

Mr. Bodkin said the point raised was whether a person in a public thoroughfare, knowing that the police were exercising their duty by watching motor-cars in order to prosecute the drivers for going at an excessive speed, by giving a signal to the drivers which caused them to slow down over the police trap obstructed the police in the execution of their duty. The proceedings were taken under the amending Act of the Prevention of Crimes Act of 1881. The later statute provided that the provisions of the earlier one should apply to all acts resisting or obstructing a police officer in the execution of his duty. The police had measured spaces at distances of one furlong apart. While they were so engaged, Mr. Little, by signals and by calling out "Police trap," warned motor-car drivers of the presence of the police, and the drivers slowed down. The respondent was fully aware that the police constables were on duty, and the warnings were repeated by him on upwards of a dozen occasions for forty minutes.

Mr. Avory said that the case did not set out that one of the motorists was travelling at an excessive speed at one time, and it was found that the respondent was not in any way acting in concert with the drivers. Therefore he was an independent citizen doing what he had a right to do. The argument on the other side appeared to be that they must not deprive the police of their lawful prey.

The Lord Chief Justice, in dismissing the appeal and upholding the refusal of the justices to convict, said he was by no means satisfied that no offence had been committed, though he could well imagine that with proper allegations as to breach of the law and the proximity of immediate detection there might be an interference with the course of justice. He thought they would be straining the criminal law to hold that there was an offence in this case upon the facts. The matter was more one for the Legislature.

The other judges concurred, and the appeal was dismissed with costs.

## POLICE TRAPS.

AT Sturry, on the road between Canterbury and Margate, is a measured distance of, it is reported, only 110 yards. We shall be pleased to have definite information on this point, as well as upon the reason for the police activity against motorists, which seems to be growing in the county of Kent.

THERE is a fine twenty mile road from Chester to Whitchurch, and on the stretch from Broxton to Tushingham the police have a measured distance seven miles in length.

THERE are police traps in the Upper Shoreham road, Southwick, the Lancing road, and at Fishergate and Kingston-on-Sea, stoppage in which is a prelude to appearance at the Shoreham Police Court, where "Motor Days" are now a regular feature of the week.

IN prosecuting a motorist at the Penkridge Police Court the solicitor representing the Chief Constable of the county described a police trap on the Watling Street Road at Weston-under-Lizard. He said an electrical apparatus was set up over a measured quarter of a mile, with batteries at each end. The wires were set inside a wall which ran along the side of the road, and, by permission, through the grounds of the Rectory. At one end of the wire were stationed Inspector Tucker and Police-constable Wheatly, and at the other Sergeant Harris and Police-constable Willis. Before a car entered the section a warning signal was given, and when it had passed a certain point another signal was given, and the stop watches were set going.

A NEW police trap has been established in Surrey, extending over a distance of no less than five miles. The terminal points are the milestone just beyond Milford village—namely, the thirty-third from London—and the thirty eighth stone from London, which is also inscribed "6 miles to Liphook." The latter is just below the last shoulder before reaching the Devil's Punch Bowl.

THERE is a police trap in the Shooters Hill road, S.E. It is on the London road leading to Shooters Hill, Dartford, &c., and is located between the "Sun in the Sands" public-house and Blackheath. The trap is near a portion of the road which has just been laid with asphalt for the prevention of dust. The police are in plain clothes and are said to be not very accurate in their timing methods.

THERE is a police trap on Kingston Hill (Surrey) every Saturday and Sunday; the exact position is often changed. We believe this has been established in consequence of the complaint of one resident.

THE police in the Haslemere and Hindhead district are reported to be about to enter on a new and active campaign against motorists. The method adopted will be one with which the Automobile Association

patrols have long been familiar on the Portsmouth road. A flying column, or rather detachment of police, in both plain clothes and uniform, will rapidly manoeuvre on the roads in question, setting a trap, snatching up a car or two, and then, when the alarm has been raised, darting off to another point.

SCOTTISH motorists should beware of the police trap that has been established on the Kilmarnock road, about thirteen miles from Glasgow.

## PUBLIC MOTOR SERVICES.

MOTOR-BUSES are becoming familiar objects among the traffic of Edinburgh. The Edinburgh and District Motor Bus Company have been running such vehicles from Toll Cross to Craiglockart Station, and the service between the G.P.O. and Murrayfield is now being run in three half-penny stages. The Scottish Motor Traction Company, which previously ran motor-buses to Corstorphine, Cramond, and Loanhead, have instituted a direct service from the Waverley Station to Colinton Road via Princes Street, Lothian Road, and Tollcross.

FIXED stopping places are to be allowed in Birmingham for the motor-buses plying for hire in the city.

THERE is a probability of the Ayr Town Council running motor-buses in the near future.

THE Great Western Railway Company contemplate a service of motor-buses between Aberystwyth and Aberayron.

THE motor-bus that has been seen on the roads about Chichester during the past summer has now been withdrawn, the reason assigned being the bad condition of the roads.

A COMMITTEE has been formed, with Mr. R. W. Bates, of the Alfreton Ironworks, as one of the moving spirits, to establish a motor-bus service in the Alfreton district.

## MOTOR-BUS DRIVER'S DUTIES.

THE first case dealing with the position occupied by motor-bus drivers in relation to the Employers' Liability Act was heard at Brompton on the 1st inst. Henry Legge, of 54, Colehill Lane, Fulham, a mechanical bus driver, sought to recover damages from the London and District Motor-Bus Company in respect of personal injuries. According to plaintiff's story, he was about to drive his motor-bus from the depot at Farm Lane, Fulham, when the starting handle, of which he had previously complained, failed to release itself automatically, as it should have done, and spun round at about 900 revolutions a minute, owing to the engine starting. The handle struck Legge's arm, and broke it so badly that the bone was within an ace of penetrating the skin. Some idea of the nature of a motor-bus driver's business was to be gathered from a list of the mechanical contrivances he daily had to control. The list was put in to prove that Legge was employed in manual labour within the meaning of the Act. His left foot controlled a clutch and a foot-brake, his right a throttle valve brake, and his right hand a hand brake. The left hand manipulated three levers—two for the speeds and one for the engine release—and in addition to this he had to look after the steering wheel, a lubricator, and an oil pump. He travelled seventy miles a day, and had when necessary to tighten bolts and adjust parts. For the defence it was contended that the buses were overhauled every day, and that the mishap to plaintiff was a pure accident. The judge pointed out that a horse-bus driver had been held by the Appeal Courts to be outside the statute, and it was for the jury to consider whether the duties which plaintiff had described brought him within the Act. The jury found that the plaintiff was a manual labourer within the meaning of the Act, and awarded him £150 damages. They added that, in their opinion, negligence and want of proper supervision had been proved. His Honour reversed this decision, and entered judgment for the defendants, although he confessed that he would have been with plaintiff in the contention that he was employed in manual labour within the meaning of the Employers' Liability Act. He did not consider negligence had been proved, and had only heard the jury's verdict in order to save a re-hearing of the case if a higher court sent it down again. Stay was granted in view of an appeal.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

# THE Motor-Car Journal.

LONDON, SATURDAY, NOVEMBER 17, 1906.

[No. 402.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

**W**EDNESDAY last was an important anniversary in connection with the automobile movement, and although we anticipated the event by the publication of our Anniversary Number on the 27th ult., we may point out the appropriate celebration of the day by the Motor Union. That important body held a national conference

to discuss the future and an anniversary dinner to pay a tribute to the past. Certain it is that the progress has been steadily progressive, the occasional spurts and frequent set backs not having seriously affected the ultimate result. Signs are everywhere apparent that the industry is now becoming recognised as one of the standard branches of the engineering trade, and companies and firms engaged therein are generally acknowledged to be of substantial character. This is a very hopeful sign of the times, and all will pray to be free from the wiles of such financiers as those whose operations ten years ago led to many vain hopes that were never realised.

### Inspector Jarrett Again.

REIGATE, Inspector Jarrett and Mr. Staplee Firth are a trio of names that have frequently figured together in recent years. They were again in juxtaposition on Saturday—much to the chagrin of the inspector and greatly to the satisfaction of the solicitor, whose persistent questionings of police officers have so often proved disconcerting to official witnesses. Mr. Paul Brodtmann, who is well known in the tyre world, was summoned for exceeding the legal speed limit by the rate of seventeen miles an hour. In the course of the hearing Mr. Staplee Firth asserted that it was well known that Inspector Jarrett had boasted of his *modus operandi* in obtaining convictions when at Guildford and at Ripley, and the magistrates at those places had dismissed a number of cases, as his evidence could not be relied upon. At Ripley, for the last two years, there had been none or very few prosecutions. After Inspector Jarrett left that district cases were dropped, but it now seemed as if the inspector had commenced again in Reigate. The case against Mr. Brodtmann was dismissed, as well as two others, the sensation of the day culminating in Mr. Firth making application for a summons against Inspector Jarrett for threats and assault. He was informed that the proper time to make such an application was at the opening of the Court, and promised to renew the application at the next Court.

### Technical Training.

DURING the past year, so full of commercial success, the directors of the Daimler Motor Company (1904), Ltd., have not omitted to look ahead, and Mr. E. Manville, who succeeded Sir Edward Jenkinson as chairman, told the shareholders at the meeting last week that the Board had come to the conclusion that the progress, not only of their own business, but that of the automobile industry generally, depends on the technical training of young men anxious to enter the industry.

Hence it had been resolved that such a system of training should be inaugurated as would compare with the other methods of the Daimler Company in its thoroughness. This scheme has been successfully started, the fundamental principles of which involve a general technical education under the supervision of a competent officer of the company, as well as detailed instruction in design and manufacture, whilst at the same time no profit is made out of the pupils, the charges inflicted being only such as to cover the actual expenses to which the company is put. Such a system, if widely and wisely adopted, will do much to provide the industry with a supply of competent men.

### The Motor Union.

ALREADY there is competition for the honour of receiving the Motor Union next year in many of our leading provincial towns. Lincoln has just approached the motorists' organisation; the Derby club has been considering the question of giving an invitation; and now the Blackpool Motor Club have put in a claim for a seaside gathering, their town to be the venue. From the point of view of emphasizing the pacific intentions of motorists, these peripatetic assemblies have been admirably conceived and successfully carried out in Chester, Bath, Harrogate, Nottingham, and other centres. Equal utility should follow next year's meetings, and we would suggest that all likely invitations should be obtained early, so that acceptance or otherwise can be made on some kind of plan to secure a wise disposition of influence throughout the country.

### Motor-Car Imports and Exports.

THE importation of foreign-built cars into this country continues to show a steady increase. According to the returns now available no less than 380 cars, valued at £189,666, were imported during last month; parts were responsible for a further sum of £168,589, giving a combined total of £358,255, which compares with only £188,927 in October, 1905. As regards the imports during the first ten months of the current year, these have amounted to 5,201 cars, worth £2,199,199, and parts to the extent of £1,598,686, the aggregate of £3,797,885 contrasting with only £2,887,178 in the first ten months of last year, or an increase of roundly £910,000. Turning now to the exports of British motor-cars and parts, these, during October last, amounted to £105,399—the largest so far recorded in any one month. For the first ten months of 1906 the shipments comprised 1,021 cars, valued at £368,519, and parts estimated at £247,146, the total of £615,665 representing an increase of £256,018.

### The Institution of Automobile Engineers.

AT the inaugural meeting of the Institution of Automobile Engineers, which will continue with headquarters in London the work which the Motor and Cycle Engineers' Institute has been doing at Birmingham, Colonel Crompton, the president, explained the objects in view. He said that the old Institute had done good work at Birmingham for many years in the reading and discussing of papers, but it was felt that as London was the centre of everything, including the automobile

movement, the headquarters of an institution dealing with this new profession ought to be in London. It was hoped to include in the Institution all those connected with motor engineering, and it would be the Council's aim to arrange for the discussion of the questions of the hour as they turned up. There could be no doubt, he added, that the profession provided an opening for the exercise of the highest talents of the mechanical engineer. The rules provide that candidates for admission as members must be persons not under twenty-five years of age who have occupied for at least four years "a responsible position in the practice of automobile engineering."

#### Motor-'Bus Side Slips.

THE attention of the A.C.G.B.I. having been called to the many accidents which have been caused of late by and to motor-omnibuses on account of the slippery state of the streets, it has decided to inaugurate a competition for the purpose of testing the many devices now on the market, and so determine their relative merits. Everyone will feel that

Miss Constance Fletcher, of Sutton Courteney, near Abingdon, at the wheel of her 8-h.p. M.M.C. Car.

Miss Fletcher is an enthusiastic motorist, commencing her career with an Oldsmobile; a Deauville quickly followed, while now she has, in addition to the M.M.C., a Century and a J. and B. landaulet. A month or so ago she was instrumental in forming the North Berks Automobile Club, which already has forty-eight members, including many of the leading motorists in the county.

this is a matter which demands serious and immediate attention. The month of January next has been chosen for these tests, and regulations are now being drafted and arranged.

#### Future Legislation.

THERE was a good representation of both Houses of Parliament at the new Ritz Hotel, Piccadilly, London, on Monday, when Mr. Frederic A. Coleman entertained a party of friends to meet Mr. Walter White and to enjoy his hospitality. Talking to one of these M.P.'s we gathered the impression that there is a feeling among the motoring members on the Government side of the House that reasonable views are likely to be taken with regard to the forthcoming legislation. Many inquiries have been made from official quarters as to the views of motorists on taxation and the intricate problems associated with licensing and registration, and we need have no fear that hasty and ill-advised legislation will be attempted. There is no doubt that the Local Government Board are prepared to accept

nearly the whole of the suggestions of the Royal Commission. and that the report of that body will not only be the basis but practically constitute the whole structure of the Bill, for the early production of which there seems no great anxiety.

#### The White Dinner.

REVERTING to the dinner, mention of which introduced the previous note, we would refer to it as a pleasant introduction to the serious business of the season. Although the 30-h.p. White steam car for 1907 is now in this country, nothing was heard of it on Tuesday, the reunion being entirely of a social character. Supporting Mr. Coleman were Earl Russell, Lords Hothfield and Blythwood, Sir Henry Norman, M.P.—who received congratulations on his knighthood—Sir Martin Conway, the Hon. Arthur Stanley, Messrs. R. C. Lehmann, Stopford Brooke, C. D. Rose, and H. H. Raphael, M.P.'s (relieved from the tedium of attendance at the House), and many other motorists of national fame. Mr. Walter C. White, whose firm are responsible for the White-steam car, was among the guests, all of whom were initiated into the Order of the White Carnation on entering the elegant dining room where harmony and mirth quickly carried us to the morning hours. Two toasts only were given—the King of England and the President of the United States. As at the Fiat dinner, trade topics were tabooed—an innovation that did not detract from the delight of the sixty gentlemen who were favoured with invitations.

#### Noise and the Motor-'bus.

APPARENTLY the motor-'bus has few friends. Motorists who own cars which are quiet and inoffensive look askance at the Penny-a-Time-Motorist, and the Commissioner of Police has been construing his powers in a way that has secured the locking up of hundreds of chassis until such times as less irksome methods prevail. The industry is certainly being harassed in a very tantalising fashion, and makers and designers are being much worried during the progress of their work by fear of refusal of licences when the 'buses are finished. Just as, in the early day of cars, every minor mishap to a car was magnified into a great disaster, so the troubles of the heavier vehicles are now exaggerated even by the Press of cities like Birmingham—where our confreres in the journalistic world ought to know better. In London, Sir Theodore Martin is becoming the leader of the onslaught on motor-'buses, and has inaugurated his presidency of the Street Noise Abatement Committee with a diatribe on "The Noise Fiend of London," delivered before the Medical Society of London on Monday. Not only are 'buses noisy, but "the stench that came from these vehicles was worse than ever came from the infernal regions." We confess we cannot enter into a disputation with Sir Theodore on that point; but with regard to his other fears would counsel him to patience.

#### Trading by Clubs.

EVER and anon the old question as to the association of trade matters with club affairs recurs in some new phase. The presence of commercial firms in events organised by amateur organisations for their members is a knotty point that has cropped up in some societies, and now the association of the Motor Union with the insurance business seems to have given a reason for the adoption of the following resolution by the committee of the A.C.G.B.I. at its last meeting: "That, in the opinion of this committee, the undertaking of or participation in commercial business by this Club, or by any affiliated union, society, or club, which is not essentially a trade organisation, is not in accord with the objects of this club, and is, therefore, to be deprecated and discouraged." We have italicised one word which justifies the assumption that the new insurance scheme of the Motor Union has called forth this official ultimatum. Possibly we shall next hear that the committee of the Motor Union has resolved that the publication of a newspaper and the

canvassing for advertisements constitutes participation in "commercial business," and calls for serious consideration by the A.C.G.B.I., whose official journal was once a bone of contention among members of that organisation.

### The National Conference.

WEDNESDAY's gathering of automobilists at the Hotel Great Central, London, was no ordinary affair. It was really a great national demonstration in favour of an united policy to secure a reasonable attitude being adopted by Parliament with regard to motorists. More than eighty motor-cars, clubs and organisations were represented, while the influential character of the conference was increased by inviting those members of the Legislature who are also adherents of the Motor Union. No fewer than twenty-four resolutions were submitted to the meeting, which then passed to the consideration of the suggestion of Sir John Macdonald, that simultaneous motor-car demonstrations should be held throughout the country next spring to set before the public the automobile policy. Dr. Hele-Shaw also proposed that there should be an appeal to the Local Government Board against the imposition of impracticable conditions on public service vehicles by local authorities. In our next issue we shall fully analyse the deliberations of the conference

able, but it was not unknown before the advent of the motor-car. Could the vehicle be so improved that it would not raise dust, or at all events raise it in less quantity? Any practical and efficient suggestion to secure that result they would be very glad to embody in their cars, but the more obvious remedy was that roads should be so made that they did not yield dust. Many prominent motorists had expressed their willingness to pay an additional tax provided that the money was applied in improving the roads; and they had suggested that this object would best be carried out by the establishment of a central authority to take charge of the main arteries of traffic throughout the country. That was not only a practical but a generous proposal, which the Government ought thoroughly to consider before they launched further legislation.

### A Quartette of Problems.

REFERRING to more technical matters the chairman of the Humber Company had a quartette of present difficulties to enumerate in an optimistic vein, confident that they will shortly cease to make difficult the progress of the motorist. A better study of the distribution of the weight of the car may do something to assuage the terrors of side-slip, while the worries of change speed may be minimised by a new invention now

The French Reliability Trial for Voiturettes.—The Competitors at the starting point. (See page 810.)

so that the results may be seen at a glance. Briefly stated, they may be said to follow the recommendations of the Royal Commission.

### Our Opponents.

PROBABLY had some of the members of the Highways Protection League been shareholders in the Humber or Daimler companies, and present at the meeting of either concern, they would hold a revised view of the road and its problems. As Mr. Edward Powell observed at the Humber gathering, it is really a marvellous thing that a number of well-intentioned people should now be agitating for a reversion to the retrograde anti-automobile policy of more than ten years ago. Mr. Powell rightly observed that the fault of the present law was that it drew no distinction between a crowded thoroughfare and a deserted moorland road, while the motorists in some districts were subject to a benighted Bench and an unreasonable police. The driver of a horse-drawn vehicle might pass along the road at any speed he liked so long; as he did not drive to the danger of the public, and that was all that they asked for automobilists. The roads should be adapted to the vehicles as the natural and primary remedy. The dust nuisance, he admitted, was intoler-

under test. Several makers are also experimenting with a view to ascertaining whether auxiliary wheels or removable rims will provide the better remedy for the delays caused by the replacement of punctured tyres. And, lastly, Mr. Powell is sufficiently optimistic to believe that the device for starting the engine from the driver's seat may become general, and so add to the convenience of the motorist to a very great extent. In such ways as these lies the acceleration of the popularity of the motor-car.

### An Architect on Motor Houses.

ARCHITECTS are taking an interest in the motor-car, their services being now freely requisitioned in the erection of suitable houses for the accommodation of motor-vehicles. A paper on the subject has been read by Mr. M. G. Pechell at a meeting of the Architectural Association, in which he recommended the adoption of the following sizes:—If a depth of 6 ft., plus the length of the car, is taken, a dimension of 18 ft. to 24 ft. might be made a maximum; a good working width being 10 ft. to a fair maximum of 14 ft. This is for the single car house. Where two cars are kept a width of about 24 ft. is desirable, if working benches are fitted in the house. Less can be given where working benches are relegated to a special workshop, and in this case a width of 26 ft. or upwards will accommodate three cars.

With regard to the pit, he said that where a straight run in can be secured this may be fitted with a raised wooden curb, having a light cover flush with top of curb. In other cases, a flush pit is preferable, with a cover heavy enough to take the weight of the car. The pit should not be shorter than 6 ft., up to about 9 ft. as a maximum, with a width of 2 ft. 6 in. to 3 ft., and a depth of 3 ft. 6 in. to 4 ft. 6 in., the shallower dimension being that more often used. A rebate in the wall at each side, about 3 in. deep, should be formed to take the cover, which is in short sections. Permanent steps formed in brick are the best. Brick sides and a cement floor should be employed.

#### Criticisms Invited.

ON this point of motor-houses Mr. F. Keynes Purchase, F.S.I., has also been enlightening his fellow motorists. He is of opinion that 17 ft. is not quite deep enough, but 16 ft. is probably a little too wide. Some of the longest cars now measure 19 ft. over all, and when a house of this sort is being built it is as well to provide for any contingency. Therefore Mr. Purchase suggests 20 ft. as being the proper depth. Taking the outside width of the car at 6 ft., 2 ft. should be allowed on each side, which will be 10 ft. If this is made 12 ft. or 13 ft., there is room for a small working bench. In such a house this expert has expressed the view that a pit may well be dispensed with. If the front of the car is lifted from the ground with pulleys and some supports put under the front wheels, most of the working parts can be got at; but if any heavy repairs are contemplated a pit becomes a necessity. It should be about 2 ft. 10 in. wide, and any length from 4 ft. upwards (4 ft. or 5 ft. is a good length), and 4 ft. deep. It is best to have it deep enough, as if one is too low down a box or platform can always be used to stand upon. The pit should be covered with strong boards about 2 in. thick, and in convenient lengths for lifting. In a 5 ft. pit about three lengths would be convenient. Having thus set forth the opinions of two architectural experts, we now invite the views of our readers on the subject.

#### Mr. Hall, K.C., on Commission.

MILITARY men like Lieut.-General Sir Charles Knox, K.C.B., and legal luminaries headed by Mr. Marshall Hall, K.C., gave encouragement to the Automobile Co-operative Association, Ltd., at its first annual dinner, last week, at the Criterion Restaurant, London. Mr. Hall voiced the toast of "Success to the Association," eulogising its aims and praising its methods. As a motorist he urged consideration for others, and denounced anything which savoured of secret commissions in the motor-car business. These commissions, he said, should be disclosed and everybody should know the discount that was allowed. The Association was anxious to help the manufacturers who were satisfied with a reasonable profit and were willing to give good material in their productions. It might be well to have an expert to see the quality of the materials used in the construction of cars. Good drivers, too, should be encouraged and co-operation established among motorists of all degrees. Sir Wroth Lethbridge, Captain E. du Boulay and Dr. Stuart Welles also spoke.

#### The Automobile a Factor in National Prosperity.

OUR Correspondence Columns are open to those of hostile views towards the motor-car as well as to advocates; for it is well that upholders of the automobile movement should know the worst that can be said against them as well as all the good points in their favour. Mr. Harris, whose letter appears in another column, seems to have only a parochial outlook. It may happen that in some places houses have become difficult to let owing to the fact that the local authorities so neglect the roads that there is always a quantity of dust about to be churned into the air by any passing vehicle. But the motor-bus has revived some neighbourhoods, and by taking people a long way in a little time is merely transplanting residents from one district to another. Near Bournemouth there

is an estate the development of which long ago depended on its motor-car service—one of the first of the kind; and throughout the country there are many districts that have been made more prosperous by the advent of the new locomotion. The matter cannot be regarded from a merely local platform. It is essentially one to be looked at from the national aspect, and those who are prepared to do so recognise in the automobile—whether in the form of car or bus or heavy vehicle—a new factor in the national welfare. It may have led to a kind of senile decay in some industries, but what of the impetus, tangible and substantial, it has given to others?

#### Varying Speed Limits.

SOMETHING of the difficulties that would arise in this country were the powers of local authorities unduly extended with regard to automobile regulations is presented in the United States, where the differences in the laws of the various States often leads to confusion and sometimes to trouble. Thus in Pennsylvania the index numbers on cars have to be five inches high; in most other States a height of three inches suffices. The varying speed limits, however, present only the greatest difficulty as well as the nearest approach to what would happen in our English counties if their councils were allowed to settle such questions of pace. Some of these restrictions of speed are as follows:—Missouri, 9 miles per hour; in Washington, 4 m.p.h. at crossings, 12 m.p.h. in congested districts, and 24 m.p.h. in the country; in South Carolina 6 m.p.h. at intersections of the road, otherwise 15 m.p.h. in Oregon, 8 m.p.h. in cities, and in the country when approaching within 100 yards of vehicles drawn by horses; outside such limits a speed up to 24 m.p.h. is permitted. These few examples gleaned at random from a host of regulations and inter-state laws, are sufficient to indicate the undesirability of allowing the power to settle speeds, &c., to be taken out of the hands of the Legislature, or some central authority to which it can rightly delegate its powers.

MR. G. GOLDSCHMIDT, the well-known motor accessory agent, of 333, Green Lanes, Finsbury Park, N., has opened new premises at 61, Cleveland Street, Mortimer Street, London, W., where he will have a complete range of lamps, horns, sirens, etc., on view during the Olympia Show.

A MEETING of motor-car agents will be held at Olympia on Wednesday next at 7 p.m., having been convened by Messrs. Mann, Egerton and Co., Ltd. Probably something will be said with regard to the restrictive policy of certain makers as to refusing agents the right to adopt their own means of publicity so far as exhibiting cars to likely customers is concerned.

THE new works of the New Motor and General Rubber Company, Ltd., are at 374, Euston Road, N.W.

A CENSUS was taken of the motor-cars passing over the level-crossing at Reigate Railway Station on Sunday afternoon. In three hours the total number of cars was sixty-one, of which thirty-five had been registered in London.

THE motor-steam fire engine now at the Northcote Road (Battersea) fire station, is to be sent to a new fire station at Eatham Road, Lee, while more than a score of the men will be efficient chauffeurs. Motor appliances will also be provided for the station now approaching completion at the corner of Cannon Street and Queen Victoria Street, E.C.

BRIEF speeches were made at the dinner of the Daimler Motor Company on Tuesday, Mr. Edward Manville observing that the close of the first decade of practical automobilism had witnessed the vastly increased success of the Daimler Company. He paid a tribute to the ex-chairman of the company, Sir Edward Jenkinson, and referred to the portrait of him which the shareholders had had painted by Professor von Herkomer.

MAJOR LINDSAY LLOYD has retired from the Army, and from the secretaryship of the Mechanical Transport Committee of the War Office. He has joined the board of Elastes, Ltd., which has been formed to manufacture a new rubber substitute, and will act as manager of that company.

## MOTORING IN SPAIN.

THE motor-car is responsible for quite a new literary development, viz., the novel that is at once guide-book and fiction. Mr. and Mrs. C. N. Williamson are the leading exponents of the new art, and their latest work, "The Car of Destiny," is one of the best examples of novel writing up-to-date. Naturally, in such a volume, events move fast and furiously, with high-powered cars driven to keep pace with each other impelled by Love, which never falters, but running on tyres that sometimes trouble. Fortunately they wear well; and when they do burst or puncture something of an opportune character happens to atone for the misfortune of the car.

"The Car of Destiny" is a very topical volume, in which the King of Spain and his bride are introduced with more than poetic licence, and their personalities associated with heroes and heroines in quite a familiar way. The plot of the story is slight, but the incidents woven around it are truly terrible and often difficult to imagine as possible, even in Spain, where the automobile is quickening the pace of national improvement. There is, however, some good descriptive writing occasioned by the automobile chase of the Duke of Carmona by the Marquess de Casa Triana. Thus we have an account of the pass between Old and New Castile—a pass "crowned by a lion on a granite pedestal," and then, continuing the journey:—

The grey car took the lead again, and at a turn of the road it seemed that the whole world lay at our feet; yet it was not even all of Old Castile, so vast a country is my Spain. Far as the eye could travel spread the fair land, green with the tender green of spring, yellow with patches of golden sand, darkly tufted with woods; struck with shafts of flying light, ringed in with ethereal blue. Nothing could steal from me this illuminated missal of memories, and were I to be banished tomorrow I should have Spain to keep in my heart, I said, as we rushed down the steep winding way that serpentine along the southern slope of the Guadarrama. A break-neck road it was, but nobly engineered, twisting back upon itself in many coils, letting us fly with the speed of a bird to lower levels; and it seemed that scarcely had we sunk over the brink of the mountain than we were at the turn on the right which would lead to the Escorial. Straight before us, rising out of the bare mountain-side, and seeming a part of it, towered and stretched a building vaster than any I had seen even in the limitless spaces of dreamland. Were it not for its cold regularity I should have thought myself approaching another desert of giants who made toys of monoliths and obelisks; but these appalling domes and towers could be the work of man alone. There was no toying here; all was forbidding and gloomy, for this was the Escorial—immense, sinister, as if fashioned from the grim product of those iron mines which gave its name.

By playing hide and seek with the chauffeur, who when disguised as the owner of the car, was left behind to suffer durance vile, while his master, oily and begrimed, continued his love-sick chase—additional interest is given to the story. Much of the pleasure of Continental travel depends upon the character of the driver; in this case the particular and peculiar merits of the chauffeur are responsible for some of the main diversions of the people depicted in the volume.

Now I may as well explain that Peter Ropes is no common chauffeur. He is the son of the old coachman who served my father for many years in England; was groom to my first pony; went abroad with me as handy man; was with me through most of my adventures; when I took up motoring, volunteered to go into a factory and thoroughly learn the gentle art of chauffeuring; and at this time understood an automobile and loved it as he understood and loved a horse; he is of my age almost to the day, and I suppose will be with me in some capacity until one of us dies. He has a brown face, which might have been carved from a piece of oak, the eyes of a soldier, and never utters a word more than he must.

"You said I could go to the *pelota* this afternoon," he continued. "When I came back I went to the garage, and found a strange chauffeur examining your Gloria. I stood at a distance, behind the King of England's car, and watched what he would do. M. Levavasseur, the proprietor of the garage, came in just then, and I inquired in a low voice who the fellow was. He didn't know; but the man has asked for Mr. Trevenna's chauffeur, saying, when he heard I was out, that he was a friend of mine. I gave Levavasseur the hint to keep quiet and got out of the way myself. Presently the chauffeur walked over to Levavasseur, and said, in French, that he wouldn't wait any longer."

"Well, what then, Ropes?" I asked.

"He went away, and I went after him. He didn't see me, and I don't believe he would have known me from Adam if he had. He stopped at another garage, and I thought best not to go in there. But I waited, and after a while a very dark, tall gentleman, who looked Spanish, walked into the garage. Five minutes later he and the chauffeur came out together."

What happened then must be learnt from the book itself. Suffice it to say that a stern chase ensued. But, alas! Guides are sometimes treacherous when rival lovers are about, and the way is only made smooth to the one whose gifts have the most golden hue; and so, wanting to go to Manzanares from Ciudad Real, one set of motorists asked for advice from a native who was suspiciously handy.

How the wily patrician of Spain, in love with the fair friend of the King's fiancée, motored through towns and villages pursued by his native rival—an exile from the land, but a welcome suitor to the lady who was being whirled from place to place with all the speed of the modern car, is told with vim and power. The interest of the writing is enhanced by the photographic illustrations, some of which we shall reproduce in a later issue by the courtesy of the publishers, Messrs. Methuen and Co.

We soon lost sight of gay Madrid, say the authors, with its domes and spires clear cut against white mountains, to run through a green landscape of growing corn and grape, vineyards framed for our eyes with distant hills flaming in Spanish colours, red and gold. Colonel O'Donnel pointed out an isolated elevation which he said was the exact centre of Spain, and, of course, there was a convent on its top. Every other hill had a ruined watch tower, brown against a sky of deeper, more thoughtful blue than Italy's radiant turquoise. Men we met rode upright as statues on noble Andaluz animals, grand as war horses in

Sir Edmund Verney in the 16-24-h.p. Spyker Car supplied to him by Mr. G. H. Wait, of Leicester.

mediaeval pictures; but some did not scorn to turn abruptly aside at sight and sound of our motor, to go cantering across fields to a prudent distance. Carters with nervous mules held striped rugs over the creatures' faces till we had passed; donkeys brayed and hesitated whether to sit down or run away, but ended in doing neither; yet no man frowned. It was a spin of but fifty miles from Madrid to the olive plantations (the first I had seen in Spain) near Toledo, but the road surface was not of velvet, and we had often to slow down for animals who hated, because they did not understand, that most faithful and loyal of beasts, the automobile. Therefore it was close upon one o'clock when the noble old town rose in wild majesty before us on its granite horseshoe hill, girdled by the dark gold bed of the Tagus.

Altogether the book is one in which many a motorist who has enjoyed travel in Spain will revel, while it will enthrall others to a desire to make the journey. We have little insight into the ways and customs of Sunny Spain, although here and there the touches of hotel life add utility to the pages; but it affords a pleasant guide to the roads and places while dipping deeply into the lore and history of the country. Certainly a delightful hour or two can be spent with "The Car of Destiny."

FIVE motorists were each fined £6, at Knutsford, for exceeding the speed limit when on their way to the Blackpool meeting.

## A TOUR FROM ALDEBURGH, ON THE EAST COAST, TO ABERYSTWTH, ON THE WEST.

I HAVE just completed the above tour on a 10-h.p. Turner-Miesse steam car, and it is by far the most enjoyable trip I have had. I started from Aldeburgh with my wife and daughter on October 14th, and worked across country to Stowmarket, and thence through Bury, Newmarket, and Cambridge over splendid roads to Huntingdon and Kettering, where we stopped for the night, proceeding the next morning through Market Harborough, and, by mistake, on to Kibworth instead of Kilworth. We had an awful run across country, but eventually regained our proper course at Lutterworth, and thence to the old Roman road, Watling Street. This was in splendid condition, and we made up some of our lost time, passing through Atherstone and Fazeley, where the road was packed with horses, sheep, pigs, cattle, poultry, and thronged with people. It was market day, and I have never been in such a pandemonium in my life. However, we soon worked our way through, and went on to Wyrley, passing several coal mines on the way. Here we turned off Watling Street and ran into Wolverhampton, where Messrs. Turner's works are, and left the car for the night in its native place.

We left Wolverhampton on the following Wednesday afternoon, and, the roads being very greasy, took it steadily through Stourbridge, Worcester, and climbed over the great

The Author on Turner Miesse Steam Car.

hill at Malvern known as the Worcestershire Beacon. The car went up this in splendid style without a halt anywhere, and we stopped for the night at the British Camp Hotel, some little way down the other side of the hill. It rained hard the next morning, but we got away about 11 a.m., passing through Ledbury and Hereford to Hay. Here we entered Wales, and travelled along the Wye Valley through Builth and Newbridge to Rhayador amidst the most lovely scenery imaginable and on excellent roads, the gradients being quite moderate. We met several herds of sheep and oxen on the way, and it was most interesting to see the intelligent manner in which the sheep dogs drove them past us.

Leaving Rhayador we went through Llangurig, still following the Wye, and there was a lot of up-hill work till we reached Steddfa Gurig, some 1,300 or 1,400 ft. above the sea. From here there is a splendid run down, which had to be taken steadily, as the road was loose in places. Just by the Dyffryn Castle Hotel the road forks, the right hand leading direct to Aberystwith, whilst the left also leads there, but *via* the Devil's Bridge. On this latter road there is a water splash, which I am told is usually not very deep, but on this occasion the water was dashing across in such volumes that I thought it best to go by the direct road and to approach the bridge from the Aberystwith side. It is a very quaint structure, consisting of three arches one above the other. The waterfall here and the view generally is beautiful almost beyond description—in fact, the whole way from Hay is one continuous panorama.

We left Aberystwith, and had to climb a very long and stiff hill, which the motor took splendidly, and went *via* Bow Street (which sounded quite familiar) and Dovey, past some slate quarries to Dolgelly, thence, *via* Bala, Corwen, and Llangollen, to Shrewsbury. This, considering the hills and the numerous stoppages to admire the scenery, was a good day's run. Leaving Shrewsbury, we came on to Watling Street once more, soon, however, leaving it and going through Lichfield, Burton, and Derby to Nottingham. Here we stopped, as it was very foggy and raining fairly hard. The next morning we ran through Grantham, Sleaford, Swineshead, Long Sutton, to King's Lynn and Hunstanton, our last day's run being through Fakenham, Norwich, Beccles, and Saxmundham.

The car, which I have had for over a year without spending a penny in repairs, ran splendidly throughout and took every hill without a falter. The distance altogether was about 800 miles, but previous to this the vehicle had run over 4,000 miles without a stoppage or breakdown of any sort. The tyres, which are Continentals, have not been pumped up for months and are still as hard as ever. Surely one can wish for nothing more reliable than this; and, as to cost of running, at home, where I can buy paraffin oil fairly cheap, the cost of fuel and lubricating oil is slightly under 2d. per mile.

W. H., Aldeburgh.

## A NEW WEST-END GARAGE,

A FEW days ago we had an opportunity of inspecting the large new motor garage which has just been completed by Messrs. Mitchell, on a site which was formerly occupied by a brewery, between Wardour Street and Dean Street, London, W., an entrance from both thoroughfares being available. Some idea of the size of the new building, which is entirely fireproof, may be gathered from the fact that it has a floor space of over 70,000 square feet. The ground and first floors specially reserved for garage work and the storing of cars are both asphalted, the large space providing for the prompt ingress and egress of vehicles. Just below the level of the first floor an extensive range of numbered cupboards has been provided, and it is intended to allot these without extra charge to the users of the garage for the reception of loose tools and accessories. The centre of the building is occupied by a "well," which provides light and efficient ventilation to the ground and the upper floors. At one end of the well, and extending across the extreme width, is a large electrically operated lift, capable of accommodating anything from a small car to a large motor-bus. On the second floor Messrs. Mitchell have installed a very complete range of electrically-driven machine tools, not only for repair work, but also for the construction of motor-cars. In the manufacturing department arrangements are in hand for the construction of one hundred motor-cabs, which Messrs. Mitchell propose to put in service in London. Already two sample chassis have been built, these having the 14-h.p. four-cylinder engine located under the driver's seat. The third floor is devoted to body-making, upholstering, and painting, and even the roof itself is available for washing cars and testing purposes. Messrs. Mitchell have also instituted a department for private hiring, and already landaulets, limousines, and touring cars of high power are available for this purpose. We may add that the new garage is open for the reception of cars at any time of the day or night.

MESSRS. PANHARD AND LEVASSOR, who are shortly removing their British repair works to a large new factory at Acton Vale, London, W., have just issued a most complete price list of accessories and spare parts for Panhard cars. The list extends to about 125 pages, and, in addition to being alphabetically arranged, each part is assigned an index number, on giving which any renewal required can be quickly delivered. In addition, illustrations are given of a large number of the various components, so that even if the motorist may not be familiar with the technical name of the article he requires, he can ascertain its number from the picture. The list is one which should be in the hands of all owners of Panhard vehicles.

## SOME CURRENT TOPICS.

### Radical Changes in French Racing Rules.

If the changes which have been put forward by the Sporting Commission of the French Automobile Club meet with acceptance by the General Committee of that body, a radical alteration in the rules under which automobile races are held in France will be made. Hitherto the main regulation has been that introduced in connection with the Gordon Bennett race, and which restricted the chassis weight of the competing vehicles to 1,000 kilog. While this rule has undoubtedly been of service in the evolution of the motor-car from the heavy and cumbersome machine of the early days to the relatively light and

changing must be effected by the driver and his mechanic, that detachable rims shall be allowed, and that, without affecting the result of the race as regards the fastest time, a separate classification shall be made as to the number of tyres used by each car. It will thus be seen that to a large extent next year's Grand Prix will be run on very similar lines to the British Tourist Trophy race; the fuel allowance works out, however, at about 9.47 miles to the gallon, so that, although those who intend to take part in the contest will have quite a number of new problems to solve, the competing vehicles will still be of relatively high power.

### Carburettor Troubles due to Dirt.

In view of the small opening through which petrol must pass on its way from the float chamber to the vaporising section of a carburettor, it is important that it be kept as free as possible from all foreign matter. An extremely small quantity of petrol is used at each suction stroke, and its flow is controlled

Three of the Cars used in the Military Motor Post-Service in Bosnia.

[Allgemeine Automobil Zeitung.]

powerful vehicle of the present day, the fact that motor-car builders are now able to build racers fitted with engines of over 100-h.p. and yet be within the weight limit has gradually given rise to the view that the 1,000 kilog. limitation is no longer serving a useful purpose. A decision to again hold a race for the Grand Prix de l'A.C.F. in 1907 having already been arrived at, the Sporting Commission has for some time been considering the lines on which it shall be run, and the result of their labours was made known during the past week. It is proposed that the weight limit shall be entirely abandoned and that in future builders will be free of any reservation in this respect. In place of the 1,000 kilog. restriction, it is suggested that a limit shall be placed on the fuel consumption, and that for the 800 kilometre race, which is to be run off in a single day, 240 litres of spirit shall be served out to each competitor, the one who completes the total distance in the fastest time on this allowance of fuel being the winner. Other proposed rules are that all repairs and tyre

by admitting it through a very contracted opening, especially when the engine is running slowly under throttle; therefore, the flow, if not stopped altogether, will be unduly retarded and made irregular by a very small obstruction. Thus the proper proportion of petrol vapour and air in the explosive mixture, which is the very life of a petrol engine, will be disturbed, and the motor will either fail to develop the proper power or it may stop altogether. It is, therefore, of prime importance that all petrol be carefully filtered when it is put into the tank, and as this is quickly and easily done, there is no excuse for neglecting this most reasonable precaution. A little care while in the peace and quiet of one's private garage may save a serious *panne* either in the city surrounded by the inevitable crowd, or away in the country, miles from anywhere. Taking a clogged carburettor apart, cleaning it and putting it together again on the road, even under the most favourable circumstances, is not an experience one would wish to repeat.

## CONTINENTAL NOTES.

## A Reliability Trial for Voiturettes.

The reliability trial for voiturettes organised by the "Auto," has been in progress during the past week. As mentioned in the last issue of the *M.C.J.*, twenty-two entries had been received, but of these only the following fifteen actually started:—Two Delage, two Alcyon, three Sizaire-Naudin, an Auto-Stand, a Metais, a Vulpes, a Fouillaron, three Lion-Peugeot, and a Bailleau. The first day's run was done in extremely bad weather, the rain being practically incessant; notwithstanding this, thirteen succeeded in covering the distance in the specified time. The cars which failed to finish were the Bailleau and the Metais, which were both placed *hors de combat* owing to skidding. Better weather prevailed on the 7th inst., when all thirteen cars accomplished the day's task of 200 kilometres at an average of 30 kilos per hour. The position was unchanged on the third day, but on the fourth one of the Sizaire-Naudins fell out of the running, a skid resulting in a broken wheel. An accident occurred to one of the Delage cars on the fifth day, as a result of which M. Personneaux was somewhat seriously injured. Apparently he took one of the sharp turns at too high a speed and ran into a tree. Eleven cars set out for the sixth day's run, all succeeding in covering the 200 kilometres, so bringing their

half will be returned to every competitor who actually starts, and the other half to all who finish the race within twelve hours. Not more than four machines of any one make can be entered. The winner will be awarded the Targa Florio and a cash prize of £600, the second receiving £320, the third £160, the fourth £80, and the fifth £40.

## The Triple Victory Banquet.

A banquet was held in Paris on Monday last, under the auspices of the "Auto" to celebrate the triple victory of France in the 1906 Grand Prix, Circuit des Ardennes and Vanderbilt Cup Races. The guests of the evening were the heads of the Renault, De Dietrich and Darracq firms, together with Sis, Duray, and Wagner, and their respective mechanics.

## A Run of Old-Timers.

Considerable interest was evinced in the run of old-time motor-cars which was held in Paris on Sunday last. The meeting place was in front of the A. C. F. Club House, in the Place de la Concorde, and here twenty-four old cars, including several 3½-h.p. Benz, 4½-h.p. Panhards, 2½-h.p. Renaults, 4-h.p. Peugeots, and Bollée and De Dion tricycles put in an appearance. The Arc de Triomphe was reached after a painful effort, by many of the cars "of the old brigade," but, although the pace

Some of the Vehicles which took part in the run of old Motor cars, held in Paris on Sunday last.

total up to 1,200 kilometres and qualifying for the 250 kilometre race which took place over the same circuit on Monday last. The result is appended:—

Order.	Car.	Driver.	Time.		
			H.	M.	S.
1.	Sizaire-Naudin	Sizaire	4	0	7
2.	Delage	Menard-Lucas	4	5	40
3.	Peugeot	Giuppone	4	14	41
4.	Peugeot	Goux	4	38	25
5.	De Dion	Pellegrin	4	50	22
6.	Vulpes	Barriaux	4	53	42
7.	Sizaire-Naudin	Chesnay	5	2	34
8.	Peugeot	Aimé	5	21	23
9.	Fouillaron	Grillet	7	11	34
10.	Alcyon	Thiercelin	7	16	58
11.	Alcyon	Anzani			

M. Sizaire's time works out at an average of 37½ miles per hour—an excellent performance for such a small vehicle.

## The 1907 Targa Florio Race.

The preliminary rules with regard to the 1907 Targa Florio race, which is to be held in Italy on April 21 next, have just been issued. The contest, which will be over a distance of from 250 to 375 miles, will be open for four-cylinder cars of a bore from 120 to 130 mm., and for six-cylinder vehicles of proportionate dimensions. The entry fee is £40 per car, of which

was slow, practically all the participants succeeded in reaching Ville d'Avray, where a review of the veterans was held.

## A Motor-Car Lamp Competition.

The Touring Commission of the French Automobile Club is organising a competition of motor-car lamps. The tests will be carried out both in the A.C.F. laboratory and on the road. A sum of £60 has been set aside as prizes in connection with the event, entries for which are to be sent to La Commission de Tourisme de l' A.C.F., 6, Place de la Concorde, Paris.

## Miscellaneous Items.

The value of the motor-cars and parts exported from France during the nine months ending with September last amounted to £4,137,200, an increase of £1,107,760 over the corresponding period of 1905.—A public service of motor-cars is about to be established between Grammont and Alost, Belgium.—A competition of devices and apparatus for the rapid inflation of motor tyres is to be held during the course of the Paris Salon next month by the Touring Commission of the A.C.F.—It is reported that arrangements are in hand for the construction of a motor racing track near Turin.—So far twenty-three entries have been received for the reliability trial of 1907 models which the A.C.F. will hold from the 25th inst. to December 5th.

LORD WOLVERTON, Lady Smyth, and Lord Davey are included in the list of recent purchasers of Daimler cars.

THERE is a general feeling among the competitors in the 1906 Tourist Trophy race that the length of the course should be increased. Twelve entries have already been received for next year's contest.

A MOTOR-CAR exhibition is to be held at Calcutta in January next.

THE Chester Motor Garage Co., who have a well-equipped establishment at 3A, Foregate Street, Chester, are now making Cape cart hoods of good design and finish.

New members of the A.C.G.B.I. include Lord Herschell, Baron Wassenar, Sir P. Brocklehurst, Rear-Admiral Sir A. Berkeley Milne, Bart., and Capt. the Hon. F. C. Stanley, D.S.O.

MOTORISTS will be pleased to have the Lorraine cross brooch or pin souvenirs which Messrs. Jarrott and Letts, Ltd., will supply to owners of De Dietrich cars who make application with the necessary penny stamp for postage.

THE Laystall Motor Engineering Works has been converted into a private limited company. The business of repairers, &c., will be continued as heretofore under the personal management of Mr. F. T. Bersey, at 27 and 29, Laystall Street, Rosebery Avenue, E.C.

THE Agricultural Hall Company, Limited, is offering a reward to any person whose evidence shall lead to the conviction of the originator of the slanderous report that the Hall is for sale. Notice is officially given by the company that such report is absolutely unfounded.

VISITORS to Olympia reaching London by the St. Pancras, Euston, or King's Cross Stations, may avail themselves of the free motor-omnibus service to Olympia arranged by The Motor House, from their showrooms at 314-316 and 366-368, Euston Road, N.W., direct to the Show. Vehicles will leave Olympia and The Motor House every hour.

A TRIO of books with the alliterative titles of the "Awful Airship," the "Mad Motor," and the "Silly Submarine" has been published by Messrs. Blackie and Son, Ltd. Mr. C. Robinson and Mr. W. Copeland have supplied illustrations and rhymes after the style of the old nursery jingles, making the quaintly shaped and designed volumes capital presents for the juveniles during the coming season.

IT is now anticipated that the new motor track at Weybridge will be finished early next year, and it is hoped to hold half a dozen or more meetings on it in 1907. The Automobile Club will work in harmony with the local organisation, which it is proposed to call the Brooklands Automobile Racing Club. The course will be three miles in length, elliptic in shape, and with easy curves, banked to take speeds approaching 100 miles an hour.

MESSRS. MANN, EGERTON AND CO., LTD., of Norwich, have compiled a useful leaflet of hints as to the proper treatment of pneumatic tyres, in which they assign the chief causes of the undue deterioration of tyres as follows:—(1) Insufficient inflation; (2) Insufficient section for weight of car; (3) Careless use of clutch and brakes; (4) Too high speed around corners; and (5) Neglect to patch up cuts in rubber, and allowing tyres to wait too long before retreading. Suggestions with regard to the inflation of tyres and the weighing of cars are also given by the firm.

ONE of the most interesting examples of trade literature lately received is the White Bulletin, No. 12, a copy of which Mr. Frederic Coleman will be pleased to send to any reader on postal application to 35-37, Kingly Street, Regent Street, W. It reveals the varied use of the automobile in the United States—for sport, industrial service, military use, State work, ambulance help, and other purposes. The illustrations are particularly effective, those of the havoc wrought by the San Francisco earthquake and fire being noticeably so. In the relief work connected with that disaster the White car played a conspicuous part, and deserves the prominence it obtains in this Bulletin.

## HERE AND THERE.

MESSRS. JARVIS, MILLER-SHIP AND Co. have established themselves at 71, Broad Street, Birmingham, as motor-car repairers.

FIVE lads have been hauled before the Rathfarnham magistrates for throwing stones at motorists, and suitable admonition given from the Bench.

LORD BURTON has placed an order with the Daimler Company for a 35-h.p. car.

THE Hull City Garage, Ltd., have opened a garage with accommodation for 100 cars at 57, Beverley Road, Hull, where free service is rendered to members of the Yorkshire A.C.

WE illustrate herewith the ingenious lever which has recently been devised by Mr. W. S. Jessop, of Leeds, to facilitate the fitting and removal of valves and security bolts when it is necessary to change the inner tube of a motor pneumatic tyre. The device consists of a double forked lever with clutches to fit into the rim of the wheel, to the rear end of which is hinged an upper lifting arm. In the socket of the double lever is attached a screw of suitable pitch, which actuates the top arm. The screw is fixed sufficiently near the end to obtain ample

leverage for lifting or forcing up the outer cover of the tyre and by turning the screw the cover is forced into any required position and held rigidly until the valve or security bolts are placed in position or removed from the rim. The under part of the top arm is provided with a notched portion, to act as a guide for the end of the screw, so that any slipping of the same or the lifting arm shall be avoided. On the upper side of the latter is a projection to prevent any outward movement of the tyre cover during the operation of screwing up the valve and bolts, or in placing the same in position.

Mr. LOFTUS PERKINS fitted one of his high pressure tubular boilers in an effective tractor in 1870, with which he made some very satisfactory runs. Ultimately the machine was sent to Belgium, and Mr. Perkins subsequently made a tramway engine fitted with his high pressure engine. In 1881 a steam car was designed by Mr. J. G. Inshaw, and a few years later Mr. Magnus Volk designed an electric dog-cart. But already on the Continent the application of the internal combustion engine was turning men's minds to other types, and the story of the automobile entered another phase with the inventions of Daimler and Benz

A GARAGE has been established at 5, East Bond Street, Leicester, by Mr. C. E. Gibson.

AN excellently devised road plan, showing the location of their Pimlico Wheel Works, in Rannoch Street, Fulham Palace Road, has been issued by Messrs. Smith, Parfrey and Co.

A CATALOGUE has been issued descriptive of La Grande motor saddles, made by the Lycett Saddle and Motor Accessories Company, Ltd., of Adderley Street, Birmingham. These are well designed with a view to comfort and durability. They also issue a list of their Rawido belts, which give an efficient and smooth elastic drive under all climatic conditions.

A FRENCH authority, M. Legendre, has been investigating the effect of motor-car exercise on health. He is of opinion, says the "Hospital," that the motor should be forbidden in cases of tuberculosis with fever, congestion of the lungs and liver, and gastric ulcer. Motor exercise has improved cases of emphysema, nervous asthma, chlorosis, and certain alimentary affections, including gastralgia, anorexia, and chronic constipation.

THE accompanying illustrations show the details of a new lock nut which has recently been devised and patented by Mr. E. Summerfield, motor engineer, Netley, Hants. From the plan view of the bolt it will be seen that two grooves E are formed in

the threaded part, the grooves being so shaped as to form a buttress on one side for its whole length. A shallow continuous groove C is also formed in the sides of the castle nut, in which also three equidistant slots D are cut. The slots are intended to receive a pin B, projecting above and from the inside of a spring clip A. The latter is sprung into the groove in the nut so as to fit in same closely, the projection being housed in one of the slots in the nut. The action of the whole is as follows:—In screwing the nut on to the bolt, the spring clip A being in place, the pin travels freely over the grooves E in the bolt, the form of the grooves and the elasticity of the spring clip allowing for this; but it is impossible to unscrew the nut from the bolt, or for it to work off accidentally, while the spring clip remains in the groove in the nut, as the projecting end B of the pin on the clip engages with the buttress of one of the grooves in the bolt, preventing the nut from turning back. To facilitate the removal of the spring clip from the groove in the nut, when it is desired to unscrew the latter, three other small slots are made in the nut, which enables any rigid pointed instrument, such as a nail, to be inserted under the spring clip, so forcing it out of its groove. We may add that Mr. Summerfield is desirous of entering into negotiation with a firm to take up the manufacture of his lock nut, which has already met with the approval of several motor engineers.

THE many friends of the late Mr. Dan Albene will be interested to learn that Mr. Frank S. Ogilvie, of the Garden City, Herts, has undertaken to paint a portrait in oils of that well-known pioneer of the agricultural motor.

BROOKE MOTORS, London, Ltd., the sole selling agents for the Brooke 30-h.p. six-cylinder car for the United Kingdom and all British Colonies and Dependencies, have taken offices at 35, Albemarle Street, London, W., and all inquiries with reference to the above car will be dealt with from that address.

THE Argylls Motors, Ltd., have gone into print, and now issue a fortnightly review of the progress of the agencies for their cars, as well as of much useful information to owners of vehicles. It is edited by a practical man, whose previous training enables him to do full justice to the resources at his command.

MR. P. C. MARSHALL, chairman of the New Rossleigh Cycle and Motor Company, Ltd., has, owing to the increase in the company's business, felt compelled to resign the chairmanship, to which Mr. W. L. Sleight has been elected. Mr. Marshall will, however, retain his seat on the board. The net profits of the company for the past year have been £5,046, enabling a dividend to be paid on the ordinary shares of 15 per cent.

A STRIKING indication of the rapidly increasing use of motor-cars for business purposes has been afforded us by the Albion Motor Car Co., Ltd., which has long devoted special attention to this class of automobile. Taking the number of commercial vehicles delivered by this concern in 1904 as 100, those turned out in 1905 would be 400, while those completed this year would be 900, an increase in two years of no less than 800 per cent.

CAPTAIN J. ORR-EWING was in the chair at a dinner given on the 9th inst. by the Fiat Motors to a party of friends at the Trocadero, London. Several interesting speeches were made after the repast, Colonel Bosworth proposing the toast of Automobilmism, to which Mr. Leveson Searth responded. Messrs. D'Arcy Baker, Amery Parkes, and Comyns Beaumont also spoke, voicing the good wishes of the company for the success of the Fiat car in the coming season.

FROM Mr. W. Barker, of Pitcairn Road, Mitcham, we have received a small sample tin of a new iron cement which he has recently put on the market for the repair of blowholes, cracks, surface defects, &c., in iron and steel castings, cracked engine cylinders, and also for the reliable jointing of tubes and pipes, &c. The cement is a specially dry composition, and when mixed with water into a thick paste is claimed to become as hard as iron in twenty-four hours. It is stated not to be affected by petrol, paraffin, or other oils, and that it expands to the same extent as iron.

AT the stand of the Farman Automobile Company, Ltd., at Olympia, may be seen a motor-cab very similar to those which will be run by the Landaulet Cab Company, Ltd., which has just been formed to put a number of the vehicles in service in London. The cabs will be of 8-10-h.p., geared to four, twelve and eighteen miles an hour; the bodies will be of the landaulet type, the engine being located under the driver's seat, so as to allow the cab to turn within the small space of 25 ft., as required by the Scotland Yard authorities. There will be provision for luggage, and the cabs can be used open or closed, and, therefore, suitable for use in all weathers.

DETAILED figures showing the output of the automobile factories in the United States during the calendar year 1904 have just been issued by the U.S. Census Bureau. They show among other things that during that year 21,692 cars, valued at £5,329,012, were manufactured by the 178 establishments reporting. In addition to this automobiles to the value of £175,841 were reported by establishments engaged primarily in the manufacture of other products. For the first time the figures have been classified and reveal some interesting facts. In 1904 there were 12,131 runabouts manufactured, valued at £1,766,301, and of this number 10,000 were petrol, 455 electric, and 677 steam. Touring cars to the number of 7,220, with a total value of £2,356,304, were also made in that year, and of this number 6,444 were gasoline, and 737 steam.

# THE MOTOR-CARS OF 1907.

## CLASSIFIED IN ACCORDANCE WITH PRICE OF CHASSIS.

IN the following pages will be found, in tabular form, a specially-compiled list of over 500 motor-cars—both British and foreign—which will be on the market in this country during the 1907 season. In order that it may be of service to motorists, we have arranged the cars in classes according to the price of chassis. In this way any would-be purchaser, having decided to limit his expenditure to a certain sum, can ascertain the selection of cars at his disposal with a minimum of trouble. As regards the details given in the tables we have deemed it advisable to confine these to the leading particulars of the different vehicles, rather than complicate matters by including information of a more or less technical character, and thereby rendering them somewhat forbidding to the average automobilist. While the list is the most authoritative that has so far been published, it is not claimed that it is complete, for in a few instances the makers themselves have been unable to give us the particulars of their 1907 models, and these have consequently not been included. In some cases, too, the classification may not appear to be quite correct owing to the makers or agents having only furnished the price of the complete car, leaving us

to decide as to the chassis section in which it shall be entered. Again, it has to be pointed out that whilst we have only given one type of body—usually the standard—to each chassis, the latter are usually so constructed that any desired pattern of carriage work can be fitted to it, at prices to be arranged with the manufacturer of the car or the coachbuilder. The chassis themselves, while in other respects similar, are frequently made in different lengths of wheel-bases at proportionate prices. A further point to which attention may be drawn is that of transmission, several builders now offering their clients a choice of a vehicle of the same horse-power with either a live axle or a side chain drive, while in the case of the ignition most cars can now be provided with two systems at the desire of the buyer. As regards the dimensions given under the heading "bore and stroke," these are indicated in inches or millimetres as furnished us by the makers. In compiling the tables we have been considerably impressed with the great variation in the horse-power rating adopted by the different firms, and in this connection we would venture the hope that the time is not far distant when more uniformity in this respect will prevail.

# The Olympia Motor-Car Show.

THE Exhibition of the Society of Motor Manufacturers and Traders is now in progress at Olympia, Kensington, and judging from a preliminary inspection, promises to be of considerable interest. Many makers have hastened the completion of their 1907 models in order to gain the publicity associated with the Exhibition, while others will take advantage of the Agricultural Hall Show in the spring to bring their cars before the public for next year. In connection with our report of the present Exhibition the list of prices and the leading features of the cars for 1907 will be read with interest as affording a review of easy reference to most of the vehicles in the Show.

## The Iris Cars.

The *piece de resistance* of the exhibit of Messrs. LEGROS AND KNOWLES, LTD., is the chassis of the new Iris 40-h.p. six-cylinder car, which has been designed to meet the demand for a touring car having not only sufficient power to meet all requirements, but to be at the same time as easy to drive and control as one having a smaller power, while being much more flexible, making changing of gears unnecessary, either in traffic or on the open road, unless exceptionally steep hills are encountered.

rent distributor. The latter is fixed, the ignition advance being obtained by sliding the skew gear on a feather on the shaft by means of a lever on the dashboard. This arrangement enables the high tension wires to be completely enclosed in a protecting pipe. The crank shaft bearings are of such a size that in no case does the pressure due to thrust exceed 100 lbs. per square inch. The inlet pipe is in one with the cylinder casting, and is brought between each pair of cylinders; the carburettor gives a correct mixture at all speeds and loads of the engine, and is placed on the side of the engine opposite to the valves and exhaust pipe, thus conducing to accessibility and safety. The throttle and ignition are interconnected and controlled by a small hand lever on the steering wheel. High tension magneto ignition is employed, an auxiliary by means of a high-tension distributor and a single coil being fitted when required. The magneto is placed parallel with the engine on the carburettor side, and driven by helical wheels from the crank shaft. The pump circulating the cooling water is of the gear type, and is driven in a similar manner to the magneto, but on the opposite side of the motor. The pinions driving the cam shaft, magneto, and pump are all cut with helical teeth to ensure silence, and are totally enclosed and run in an oil bath. The flywheel is of the fan type, and, owing to the tightness of the undercasing, no other device is employed to induce air through the radiator. The latter is of the honeycomb type, the shape being the well-known Iris diamond. From the engine the drive is taken to the

Fig. 1.—Chassis of Iris 40-h.p. Six-cylinder Car.

The engine is of the vertical type, the bore and stroke being respectively 4½ in. by 5½ in. The cylinders are cast in three pairs, and the interchangeable inlet and exhaust valves are placed on one side of the engine, so that they are worked from one cam shaft. The latter is arranged to slide longitudinally by means of a small lever under the radiator, in order to bring into play half-compression cams to facilitate starting; it is returned to its normal position by releasing the lever, when the longitudinal thrust, caused by the helical wheels by which it is driven, automatically causes it to move endways until arrested by a ball thrust race on which the end pressure is normally taken. The cam shaft runs in plain bushes driven into the aluminium crank chamber. The bearings are of exceptionally large diameter to allow the cam shaft to be entered from the end, and to prevent, as far as possible, the slightest wear. The crank chamber is of aluminium, and is in two parts. The main bearings are carried by the top half of the crank chamber, so that the lower part can be removed without disturbing the rest of the engine. The ordinary practice has been departed from in the construction of the lower half, which, in addition to forming an oil well of exceptional size, holding over three gallons of oil, is continued on either side to the frame, thus making the whole engine casing air and dust tight. Forced lubrication has been adopted throughout, the oil being supplied to the bearings through holes cast in the top half of the engine casing, and from thence by tubes in the crank shaft to the big ends and up to the gudgeon pins by means of pipes fixed in the connecting rods. The oil is forced by means of a gear pump submerged in the oil in the bottom half of the crank case and actuated by a vertical shaft driven by skew gears off the cam shaft. The oil pump, which can be readily removed, has a spring-loaded relief valve arranged with it, enabling the pressure of oil, usually 6 lbs. to 10 lbs. per square inch, to be varied at will, and avoiding fluctuations of pressure due to the varying revolutions of the engine. The vertical shaft carries on its upper end the auxiliary high tension cur-

gear-box by means of a multiple disc clutch running in oil. A sliding universal joint is provided between the clutch and gear-box to allow for any slight twistings that might occur, due to the inequality of the road, and for the removal of the clutch without disturbing either the gear-box or the engine. The gear-box is suspended from the frame at three points, and can be easily removed from the chassis. It is adapted to give three speeds forward and reverse, the third speed being a direct drive. All the shafts run in ball bearings; the gears are operated on the two-sleeve "gate" principle, with a single lever, a positive movement for each change of speed being provided, as well as a lock in the sliding rod, which renders it impossible for two sets of gear to get in mesh at the same time. From the gear-box cardan shaft and bevel gear convey the power to the rear live axle, the design of the latter being such that it is impossible for it to sag at the centre. The road wheels are mounted on self-lubricating ball bearings, direct upon the ends of the axle casing, close up to the springs. The differential gear and the bevel wheels are carried in an aluminium case, forming the centre of the axle, in such a way that they may be bodily removed in a few minutes without disturbing any other part of the axle or the wheels. The ratio of the bevel gears can be readily changed, thus enabling the gear of the car to be adapted to the conditions under which it is to be used. The cardan shaft is connected up to the main driving shaft in the gear-box by means of a universal joint, and is enclosed in a steel tube bolted rigidly to the axle casing at its rear end, and at the upper end rides on a ball bearing on the cardan shaft. By this method of construction it acts as a torque rod, and prevents the tendency of the axle casing to revolve. The car is fitted with three powerful metal-to-metal brakes; that operated by the foot is attached to the main driving shaft close up to the rear end of the gear-box. The hand brakes, which are operated by a pull-up lever within easy reach of the driver, act direct upon the hubs of the back wheels, and are fully compensated. The front axle is of H section steel.

The steering pivots are of a new design, and are entirely supported in ball bearings. The vertical pins do not move, and are held tight in the cones by nuts, which also hold the ball bearings in place. The steering joints are of the universal type, and have pins, the heads of which are screwed to take "Stauffer"-type grease cups. The springs are of the semi-elliptic type, and all pins and shackles are lubricated in a similar manner to the above. The rear springs are of great length to ensure freedom of vibration from road or shock. Owing to the flexibility of the engine, speeds of from three to sixty miles an hour can be obtained on the top gear by means of the combined throttle and ignition lever on the steering wheel, thus avoiding to a great extent the changing of the gear. A 60-h.p. six-cylinder Iris car on similar lines, but with cylinders 5 in. bore by 5½ in. stroke, is also being built. The next car on the stand is a fine specimen of the closed touring carriage in the shape of a limousine fitted to the well-known 35-h.p. Iris chassis. The body has seating accommodation for seven persons in all, being arranged for three people in the back seat, two comfortable folding seats, and the usual two places on the front seat. The third vehicle is a neat and compact landaulet fitted to the 25-h.p. Iris chassis, and is designed for town work. Both the last-named cars are fitted with four-cylinder engines, and are of the live axle type. Various improvements and modifications have been made in them, high-tension magneto ignition being fitted as a standard. The foot and hand brakes now act on separate drums, and the cardan shaft is now provided with a single universal joint, which latter is entirely enclosed. We may add that the cars are throughout of British construction, and will well repay careful inspection.

#### The Metallurgique Cars.

Prominent among the display of cars on the stand of Metallurgique cars is the 24-28-h.p. model (Fig. 2), which since its victory in the Coupe de Liedekerke, when it averaged a speed of forty-nine miles an

Fig. 2.—Chassis of Metallurgique 24-28-h.p. Car.

hour for five and a half hours at a stretch, has attracted considerable attention. A feature of the engine (Fig. 3), which comprises four cylinders, 102 mm. bore by 115 mm. stroke, is that the crank shaft is *desaxé*; that is to say, the cylinders are not in a perpendicular line with the crank shaft, an arrangement which is claimed to reduce the friction between the cylinders and their pistons. The cam shaft is also placed eccentric to the valves to prevent side friction to the valve tappets and seats, and, what is equally important, a quicker opening of the valves themselves. The valves of each cylinder are held by long and elastic springs, and can be disconnected by simply removing a small cotter and cap. The pinions driving the magneto, the water-circulating pump, and the half-time shaft are neatly enclosed in an aluminium casing, which forms part of the crank chamber. The crank shaft runs on special bronze bearings, and attached to one end is a flywheel nearly 24 in. in diameter, which acts also as a fan. The Metallurgique automatic carburettor, which is claimed to furnish a suitably-proportioned mixture at any engine speed, is controlled by a centrifugal governor, and also by a lever on the steering wheel. In addition to this a pedal is provided, by means of which the governor can be cut out of action and the engine accelerated up to its full power. Two systems of high tension ignition—accumulators and magneto—are fitted. The cylinder-cooling water is circulated by a powerful gear-driven pump actuated through a spiral spring, so that should the water congeal in the pump during cold weather the spring will be the first to break, and no further damage can be done. From the motor the power is transmitted to the gear-box by a metal-to-metal expanding clutch, which, as will be seen from Fig. 4, resembles in principle an internally expanding brake, the two wide semi-circular brake-shoes being forced apart so that they press against the inner walls of the flywheel boss. The gear-box is adopted to give three forward speeds and a reverse, with direct drive on top,

controlled by a single lever working in a "gate." The gear wheels are made of a special chrome nickel steel, and are hardened by a new process rendering them practically unwearable. Especial attention has been paid to the gear-box, also the engine crank chamber, in order to make them oil-tight, and to prevent stones or dirt entering to any of the working parts a readily detachable shield is fitted underneath the engine

Fig. 3.—The Metallurgique 24-28-h.p. Motor.

and gear-box. From the latter to the back axle the power is transmitted by a cardan shaft and bevel gear through a patent spring drive. The hand brakes are of the internal expanding pattern, and act on the back wheels, while the foot brake works on a drum on the driving shaft. The steering gear is of the worm and sector type, and is so arranged that any wear can easily be taken up. To facilitate steering and to save wear and tear on the tyres the front wheels are attached to the axle in such a way as to cause all the weight to fall exactly on the centre of the tread of the tyre. The springs are very long, and the frame is raised at the back so as to allow them full play. Ball bearings are used throughout, except on the engine. The chassis is sufficiently large to allow of comfortable and roomy limousine bodies with a wide side entrance being fitted. The Metallurgique cars are being made in a wide

Fig. 4.—The Metallurgique Expanding Clutch.

range of sizes, extending from 10-12-h.p. two-cylinder to 60-h.p. four-cylinder, in all of which the main features outlined above are to be found.

#### The Star Cars.

The exhibit of the STAR ENGINEERING COMPANY is one of much interest, not merely because of the new 24-h.p. six-cylinder car that is on view, but also because of the improvements embodied in the older

models. Dealing first with the "six," this is throughout on modern lines. The cylinders, which are cast in pairs, are  $3\frac{1}{2}$  in. bore by  $4\frac{1}{2}$  in. stroke. The valves are all on the one side, the inlet valves being underneath in a similar position to the exhaust valves. The two-to-one gear wheels are all enclosed. The engine is fitted with magneto ignition only. The carburettor is automatic; the lubrication is also automatic, and worked by a small plunger pump operated

Fig. 5.—The 16-h.p. Turner-Miesse Landaulet built for Alderman G. T. Brown, J.P., of Chorley, Lancs. The vehicle is the first of the kind turned out by Turner's Motor Manufacturing Company, Ltd., and its owner is extremely pleased with its running.

by an eccentric on the cam shaft; the supply of oil is drawn through a filter from a reservoir underneath the crank chamber, the pump forcing it through all the bearings, whence it returns to the reservoir. A supply tank for supplying the reservoir is fitted on the side of the frame. The gear is of the firm's usual type, giving three speeds and a reverse, with a direct drive on the top speed, the shafts in the gear-box being fitted with Hoffmann ball bearings. The top portion of the gear-box can be removed without disturbing any other portion or the gear shafts, or taking the box from the frame. The transmission from the differential shaft to the road wheels is by side chains on to wheels, formed solid with the large internal brake drums on the rear wheels. The frame is of pressed steel of deep section. The wheel base is not excessive, having regard to the six cylinders, and the body space behind the dashboard is 7 ft. 6 in. The throttle and ignition levers are fitted on the centre of the steering wheel, and there is also a foot accelerator. The cooling is by a gear-driven pump and a radiator of the honeycomb type. The next car is a standard 18-h.p. "Star" of the Tourist Trophy type, fitted with a special Windham detachable body. The engine comprises four cylinders, 4 in. bore by 5 in. stroke, fitted with magneto ignition. Four speeds forward and a reverse, with direct drive on the fourth, are provided, the change-speed lever working in a "gate." The gear-box is fitted with ball bearings, and is built on the same lines as that of the six-cylinder referred to above. The wheel base of the car is 9 ft. 6 in. A 14-h.p. car of the same type as supplied to the A.C.G.B.I. this year is also on view. It is fitted with a handsome landaulet body. The engine has four cylinders of the firm's usual type, the gear-box giving three speeds and a reverse, with direct drive on top speed and chain transmission to the rear road wheels. The wheel base is 10 ft., which enables the back portion of the body to be furnished with a good wide door. A medium-powered car is seen in a new 14-h.p. four-cylinder chassis fitted with an engine of the latest design, having the valves all on one side, actuated by a single shaft. The vehicle is, except as regards the number of cylinders, identical in design to the "six." The wheel base is 8 ft. 6 in., and the road wheels are shod with 810 mm. by 90 mm. tyres. Motorists of moderate means looking for a four-cylinder car within their limits will be interested in the chassis of the 10-h.p. car. The cylinders are 3 in. bore by  $4\frac{1}{2}$  in. stroke, the vehicle being fitted with mechanical lubrication, three speeds and reverse, with direct drive on top speed. A departure from the Star Company's usual practice is found in a live axle, which is used in place of side chains. To meet the demands of motorists who prefer live-axle cars, the makers have decided to supply their 7-h.p., 10-h.p., and 14-h.p. vehicles with live axles when desired. In the design adopted ball bearings are used throughout, and the weight of the car is not carried on the driving shaft, but upon the axle casing. The frame, which is of pressed steel, is supported on long springs, ample length behind the dashboard being available for a roomy and comfortable body. The 7-h.p. Little Star cars are also to be seen at the stand. Among the changes which have been made in this popular model are a honeycomb radiator in place of the usual gilled type, an H section stamped steel front axle instead of the tubular one of last year, push pedals for the clutch and brake. The vehicles have a wheel base of 6 ft. 9 in., the usual three speeds and reverse with direct drive on top speed, and transmission by chains to the road wheels. Altogether the 1907 models of the

Star Company will be found thoroughly up to date, and their relatively low price and sound construction should fully maintain their popularity.

#### The Turner (Miesse Patents) Steam Cars.

The Turner (Miesse patents) steam cars are again kept well to the front by TURNER'S MOTOR MANUFACTURING COMPANY, LTD. The name "Miesse" has led some people to imagine that the cars are of foreign construction. It may therefore be advisable to mention that the Turner steam cars are built entirely at the company's works in Wolverhampton. The vehicles are now so well known that it is unnecessary to describe them at length. We may, however, state that they are fitted with a three-cylinder single-acting engine, its great feature being that there are no glands or packing to require attention. The control is extremely simple, one pedal and a lever being all the driver has to attend to during the time the car is running. The one lever governs the supply of water to the generator, and therefore regulates the speed; the single pedal instantly cuts off the steam, and when depressed still further puts a double-acting brake on the crank shaft. The advantage of this system is that the driver cannot carelessly put on his brake before cutting off the power. The generator, which is of the "flash" type, is made in four sections, so that the bottom section can be replaced at a trifling cost when necessary. The burner fitted in these cars uses ordinary paraffin as fuel. The cars exhibited embody a number of improvements. A new burner regulator is now fitted, by means of which the flame can be turned up and down as in a gas stove, so that the car can be kept waiting about and yet be ready to start at a moment's notice. A feed-water heater is also provided, which utilises the exhaust steam to heat up the water on its way to the generator. This effects the two-fold purpose of cooling the exhaust steam before it enters the condenser, and of heating up the water on its way to the generator. The makers claim that this improves the running of the car fully twenty per cent.

#### The Maudslay Cars.

For the 1907 season the MAUDSLAY MOTOR COMPANY, LTD., are confining their energies to two types of cars, i.e., 20-30-h.p. and 35-45-h.p., each being fitted with four-cylinder engines. The vehicles on view include a 20-30-h.p. chassis fitted with popular type of extended landaulet body capable of seating five persons inside, neatly constructed folding seats being fitted at the back of the driver's seat, and a 35-45-h.p. side entrance omnibus, which is really an extended limousine. The body work of the cars is of the usual high-class finish associated with the Maudslay firm, and is constructed by Messrs. McNaught and Co., of Worcester. With regard to the general design of the chassis, the special features are much the same as last year. The hinged cam shaft and the situation of the valves in the tops of the cylinders immediately over the tops of the pistons are retained in the motor as in last year's models. The 35-45-h.p. cars have ball bearings throughout, the 20-30-h.p. having plain bearings in the road wheels and a few other parts. The frame of the vehicle is still a distinctive feature of the Maudslay cars, as the rectangular steel tube frame, with a subsidiary one of the same material braced to the upper frame by a fitch plate, is still employed, the firm informing us that it has proved far more rigid than the ordinary pressed steel frame. A new design of carburettor has been introduced, which gives exceptionally quiet running, and enables the engine to be throttled down to below 200 revolutions per minute when the car is standing. The Bassé-Michel

Fig. 6.—The Maudslay 20-30-h.p. Extended Landaulet.

system of dual ignition has been adopted as a standard fitting. A feature which was adopted by the Maudslay Company last year, and which has proved very popular, is having the direct drive on the third speed, and using the fourth indirect speed for fast travelling on flat and open country roads.

#### The Talbot Cars.

THE CLEMENT-TALBOT COMPANY occupy a large stand with five cars, four of which are London-built and one a Parisian model, all having four-cylinder engines. The former comprise a 12-16-h.p., with standard side entrance body, a 15-h.p. chassis, and two 20-h.p.'s—one with a standard side entrance body, and the other with a limousine landaulet. All are fitted with four-cylinder engines. The Paris model 10-14-h.p. is an

entirely new design. The 15-h.p. chassis represents the latest production of the North Kensington Works, and is quite a new model for the 1907 season. The engine has its four cylinders separately cast, with the interchangeable valves set on opposite sides. The bore is 90 mm. and the stroke 117 mm., the normal speed being 1,100 revolutions per minute. Other features of the engine are, the lower half of the base chamber is removable without disturbing the crankshaft bearings, and

Fig. 7.—Section of Climax Clutch.

presents the largest possible facilities for adjustment and inspection of engine gear. All the distributing pinions are enclosed in the crank chamber. The pump and magneto are gear-driven, and are carried on the motor itself. The carburettor is a new and improved form of the float feed spray type, with adjustable spring-controlled automatic air feed and an auxiliary air inlet, hand-controlled on the inlet pipe to compensate for atmospheric variations. Two systems of high tension ignition—magneto and accumulators—are fitted, working through a common high-tension distributor and duplicate plugs. An interesting departure is the adoption of an automatic control for the ignition, which serves to give a correct firing point at all engine speeds; this is sympathetic with the engine control by the throttle lever fitted to a ratchet quadrant on the steering wheel. As regards the lubrication of the engine, the oil is pressure-fed direct through sight feeds on the dashboard to the principal bearings, an auxiliary hand pump being provided for emergency purposes. The clutch is of the leather-faced cone type, buffer springs being provided. The gear-box, the shafts of which run on ball bearings, is adapted to give four forward speeds, and a reverse is controlled by a lever working in a "gate." The cardan shaft, which is provided with a single universal joint, runs on ball bearings inside a long sleeve, which takes the place of the usual torsion rod. The final drive is through a ball-bearing differential gear to a live axle, which has only the driving strain, the weight of the car being carried on the axle casing, on which

Fig. 8.—Section of Climax Adjustable Universal Joint.

the rear road wheels run on ball bearings. The front axle is of T section steel, and the brakes are as usually fitted to Talbot cars. The pressed steel frame is supported on five long flat springs, the engine and gear-box being carried on a sub-frame. The 12-16-h.p. model is similar to that which has performed so consistently during the last season in the hill-

climbing and speed trials all over the country, several improvements in the fitting of the bodies being, however, introduced. The 20-h.p. car is also similar in detail to the 1906 model, save that a leather-faced cone clutch displaces the multiple disc, while the four-speed change gear is now operated by a lever working in a "gate." Five-spring suspension is also adopted, and every bearing on the car save the crankshaft runs on balls.

#### The Climax Cars.

For the coming season CLIMAX MOTORS, LTD., Coventry, are building two sizes of cars—a 20-28-h.p. six-cylinder with White and Poppe engine and a 16-h.p. four-cylinder with Aster motor, the chassis of both of which are adapted to receive any type of open or closed carriage body. The Climax vehicles are worthy of close inspection, as quite a number of interesting features will be found incorporated in the design. The engine, clutch, and gear-box are carried on a sub-frame, which is suspended at three points. The clutch is of the cone type, but having metal-to-metal engaging surfaces running in oil. The device, which is made under Dixon's patents, has recently undergone a severe test, and has proved itself very efficient and capable of giving a smooth engagement. Provision is made for readily adjusting the conical rings and the spring, but the makers inform us that once the clutch has run for a few hundred miles and the cones have bedded themselves one to the other, adjustment becomes practically unnecessary. Referring to Fig. 7, which gives a sectional view of the new clutch, A represents the fly wheel of the motor with an internal cone surface, and B the male portion of the clutch C is a hardened steel sliding cone operated by the pedal P and the spring O. D and E are hardened steel conical rings, forming a V-shaped groove, which is fitted with anti-friction balls F. To engage the clutch the cone C is pushed under the balls F, causing them to rise and wedge themselves between D and E.

Fig. 9.—The Bevel and Differential Gear on Climax Car shown detached.

As D is supported by the steel plate G bolted up to the flywheel, the ring T forces the gripping cone B against the flywheel. The plate G, as will be seen, encloses all the parts, and enables the clutch to be run in oil. The cone surfaces are inclined 10 deg. from the axis, and running in oil ensures perfect slipping when the pressure on the cone C is slightly relieved by the pedal. The plate G, which is of suitable thickness to allow of a slight bulging under pressure, thus adding to the flexibility of the clutch, supports the whole of the pressure necessary to cause the two cone surfaces to grip, the end thrust being thus self-contained, the only thrust on the engine crankshaft being the small pressure on the cone C. The latter is free to revolve, thus offering no resistance to the perfect rolling of the balls F. Adjustment of the cone is effected by means of the screwed bush H, which pushes the ring D into the correct position, and is fixed in place by means of the locking ring I. A bearing is provided at K, taking the thrust on the cone C. To disengage the clutch the cone C is withdrawn from beneath the balls F, and coming in contact with the transmission coupling L, the male portion B is positively pulled out of action. Further movement of the cone C to the rear pushes into action the clutch stop, which consists of two small adjustable friction cones fixed to the gear-box. The simple means of adjusting the clutch stop is so well shown in the illustration that further description is unnecessary. The Climax Company inform us that they have been appointed sole licensees of the invention, and that they are prepared to supply motor manufacturers with this type of clutch, or to grant sub-licenses. The change-speed gear control is of simple construction; all the advantages of the gate principle are retained, but the controlling

lever moves along a single slot. Any forward speed may be operated without passing through an intermediate gear, and the company claim that it is absolutely impossible, either by intention or design, to engage two gears at the same time. The change-speed gear itself is of the usual sliding pinion pattern, giving four speeds forward and one reverse, the direct drive being on the third speed. The shafts run on ball bearings. The transmission is by a cardan shaft and bevel gear to a rear live axle. Fig. 8 gives a sectional view of the improved universal joint used on the cardan shaft, the feature of the arrangement, which is due to Mr. J. Wilson, the works manager of the company, being the provision of means of adjustment so that any wear may be readily taken up. Referring to the illustration, A is the continuation of the gear-box shaft, on which is mounted the usual jaw piece H in such a way that it is free to slide longitudinally. Both of its bosses are provided with screw-threaded holes, into which fit hardened steel internally-coned bushes. These when screwed down into the arms engage with a central hardened steel piece J, which has four coned ends, the plane of two being at right angles to the plane of the other pair. The other jaw piece C is secured in the usual way to the cardan shaft B. Thus to take up any wear on the coned ends of the central piece J it is only necessary to screw up the bushes F, the latter being fixed in position by the locking plate G. Another interesting feature of the new joint is that it is entirely enclosed and runs in oil. Abutting against a flange on the jaw piece H is an aluminium plate K, to which is bolted a spun aluminium shield D. The pump plunger washers E prevent the escape of the oil. Oil ways are provided in the joints and cones, so that the oil readily finds its way to the different bearing surfaces. The rear live axle is also of special unique design; its chief advantage is its great accessibility. In accordance with the latest practice, the road wheels are carried on the sleeves, and are driven by means of stars attached to the different shafts. When the hub caps are removed these stars and

Fig. 10.—The 20-25-h.p. Brotherhood Car recently built to the order of Miss Hawker, of Plymouth. As illustrating the extreme simplicity of control it may be mentioned that Miss Hawker's vehicle is being attended to and driven by her coachman, who until a few weeks ago had had absolutely no experience with a motor-car.

differential shafts, the inner ends of which are square in section, as shown at A in Fig. 9, may be taken out with difficulty, and without interfering with the road wheels in any way. When the circular inspection door on the rear of the live axle is removed the whole of the differential gear is exposed. Furthermore, by the removal of four other nuts and the two caps which they hold in position on bolts (one of which is seen at D, Fig. 9, the whole of the differential gear may be removed, and also the bevel driving pinions. Thus the whole of the working parts may be taken down and reassembled without dismantling any other part of the car or the road wheels, springs, &c. Both the foot and hand brakes operate on drums attached to the hubs of the rear road wheels. The hand brake is of the internally expanding type, and a differential device is fitted, ensuring both halves of the expanding members operating with equal force. The foot brakes engage with the outer periphery of the drums through the medium of a brake band, operated by a toggle arrangement. Instead of the ordinary shackle, the springs which support the frame on the axles are furnished with slippers which slide after the manner commonly seen in locomotive practice.

#### The Brotherhood Cars.

A chassis and two complete cars of the Brotherhood 20-25-h.p. type form the exhibit of the SHEFFIELD SIMPLEX MOTOR WORKS, LTD., formerly known as Brotherhood Crocker Motors, Ltd. During the past season the vehicles have proved so satisfactory that no material alterations have been introduced in the latest models. Special attention has been devoted to accessibility, reducing the work of adjusting and replacing any of the parts to a simple and easy matter. The automatically advanced and retarded ignition, carburation, lubrication, &c., are all retained. The control of the engine by means of a pedal or foot rest with a side motion remains a feature of the design, this enabling the finest graduation of engine speed to be obtained, and also permitting the motor to be used as a powerful brake. The springs on which the

chassis is supported are of great length, and are so made that the surfaces of the plates can be lubricated at any time without the necessity of taking the springs apart. This obviates the formation of rust between the spring plates, the presence of which greatly reduces their flexibility. Of the two complete cars on view, one is fitted with a Roi des Belges side entrance body, with Cape hood and glass screen. It is by Messrs. Thrupp and Maberley. It has accommodation for two persons on the front and two on the rear seat, and is fitted on a chassis having a wheel base of 9 ft. 3 in., which allows for large side entrance doors. The Cape hood is of an improved type by Messrs. Mulliner and Co., being constructed so that it can be utilised as three independent hoods—viz., as an ordinary Cape hood extending over all the seats, as a Victoria hood over the rear seat only, and as a single hood to cover the front seat. The second vehicle is fitted with side entrance tonneau phaeton body by Mulliner, of Northampton, with canopy, having glass screen rising from dashboard, and also a curved glass screen at the rear of both front and back seats.

#### Rivals to the Horn.

A feature of the comprehensive display made by MESSRS. A. W. GAMAGE, LIMITED, is the number of whistles which they are introducing for use on motor-cars. One is the new "Excelsior" motor

Fig. 11.—The Paris Express Whistle.

whistle, which can be easily fixed to the exhaust pipe of the car, being blown by the exhaust gas. There is also Le Ton Yam whistle which, like that already mentioned, is fitted to the end of the exhaust pipe. This is done by means of a bronze collar, the whistle being connected by a flexible cable with a foot or finger lever at the side of the driver. We illustrate in Fig. 11. the "Paris Express" whistle actuated by the exhaust gases. After action it closes automatically in an aluminium case, thus being protected from dust and mud. Many other useful novelties

will be found on this stand, including a collapsible waterproof pail, which will be invaluable to business men who drive themselves, as well as on cars engaged in touring. The "Holborn" speaking tube, by means of which the passenger in a closed vehicle may communicate with the driver, is on view, as well as the "Southall" tyre gauge previously illustrated and described in our columns.

#### Vulcanising Plant.

Messrs. HARVEY FROST AND CO., LTD., exhibit their H.F. "Car" vulcaniser for the repair of motor covers and tubes by the Harvey Frost vulcanising process. The new auxiliary appliance, to which we referred on page 794 of our last issue, is shown. This is a portable simple appliance for use with the present "Car" vulcaniser, to which it can be adapted without any alteration whatever, enabling efficient and lasting repairs to be made to weakened, decayed, broken, or burst fabric in the foundation of the tyre cover, in addition to the repair of defects in surface rubber. To present and future users of the H.F. "Car" vulcaniser this new garage vulcaniser will be of considerable interest. Another new H.F. appliance is the H.F. jointless tube joiner, which, in conjunction with the Harvey Frost process, enables motor tubes to be joined with "jointless joints," paradoxical though it may seem, there being no definite line of union between the two united materials, but a perfectly homogeneous amalgamation, flush and frictionless, achieved by the actual process employed in the making of the tube itself. Other appliances exhibited are a new tube vulcaniser, the H.F. "Standard" A and B vulcanisers, and the large "Re-treader" plant, the latter for trade use only. The H.F. vulcanising materials are also displayed.

#### Non-skids and Tyre Levers.

The points of the Pullman band have become familiar to motorists, both at exhibitions and on the road, and their stand will be visited by many anxious to see the latest developments in non-skids. The metal

Fig. 12.

surface that comes in contact with the road is now made of hard steel instead of the mild steel that has been employed. That side of the metal surface which comes next to the tyre is perfectly smooth, thus saving the wear that frequently takes place. An interesting special feature of the productions of Messrs. R. AND J. PULLMAN, LTD., is that the leather is made by the firm themselves at their works at Godalming. The bands can be supplied with circular or hexagonal studs. The excellent tyre lever shown at the stand has previously been described in our columns, but we herewith illustrate the No. 2 pattern which has been introduced to facilitate the removal and insertion of valves and security bolts.

(To be continued.)

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### THE TENTH ANNIVERSARY—AND AFTER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It really seems almost incredible that so much could have been done in the short space of ten years, that the automobile industry could have reached such great proportions, or that in this time so many cars would be running as to threaten to shortly altogether supersede the horse for the purposes of traction. There is probably no parallel in the history of any industry or any movement for so great a stride forward in so short a time. And how many men foresaw this? "I remember, I remember," at the Stanley Show of 1894, when I exhibited an automobile engine which weighed only 80 lbs., and ran at 600 revolutions per minute—the first engine sold for the purpose of propelling a car—certainly in this country—how many of the men who are now pro-

objections and man's prior record, I will venture to say—odd as it may seem at present—that the air is the most suitable medium, not only of communication, but also of travel and transport. It is certainly the medium offering the least friction and presenting the fewest restrictions. There are no boundaries, as on land, compelling one to turn at right angles and to take a zigzag course, nor is one limited to the surface as at sea. Why cannot the men—and they are now numerous—who are interested in this great problem, combine to solve it? Why should we lag behind, when first America, and now France, are going ahead in this matter? I propose the formation of an experimenting association, to be called The Aerial Association, to which there shall be only a small annual subscription (say 10s. 6d.) so as to obtain as large a membership as possible. The whole of the funds of the association should be devoted to the solution of the problem of flight by the heavier-than-air system. If the funds should permit, I should suggest experimenting with the best design offered the association on the three known lines, viz., the aeroplane, direct lift, and wing-flapping. If my own design of direct lift and aeroplane should be found to be of no use, I should be the first to bury it in oblivion, and to strenuously assist in making some better design a success. If the association should solve the problem and make some machine successful or partially so, then shares in the successful invention should be at once issued to every member in proportion to his subscriptions.

I hope that the formation of the association may have your

The Bear's Head, Brereton, Cheshire. This fine old inn is situated on the main road from Holmes Chapel to the south. It is in the black and white style so much seen in Cheshire. (Mr. H. Wade. Photo by)

minent in automobilism, and others smiled when I expatiated on the certainty of horseless carriages coming into wide and general use and on the great changes in locomotion which would be seen in ten years' time, and how that smile broadened and deepened! The only sales at that time were to French engineers. One engine was sold to the Peugeot firm. The motor exhibited was a four-stroke engine, not a two-stroke, as I have heard asserted. The two-stroke engine was fitted to a Coventry Machinist tricycle in 1892. The four-stroke motor was not unlike the single-cylinder engine of the present day. And as to the future? There can be no doubt that the motor will continue to be improved month by month and year by year, until the objections are gradually removed. Noise and odour will be eliminated, except in old vehicles or those out of repair, and in spite of the rapid increase that will continually take place in the numbers of cars, breakdowns will less frequently occur. This ever-progressive growth and improvement in automobiles will continue until the horse for tractive purposes will be obsolete.

The future of the motor-car is unquestionably assured. But the future, nevertheless, is not with the automobile. It is with the aerial machine. With the same confidence in the future with which I made the first oil engine in 1887, I now predict the early and general adoption of the aerial machine. With the like confidence I can say that I believe that I could now (and could have done at any time during the last three years) design and construct a successful aerial machine—a design and construction on sound engineering lines—a machine the essential characteristic of which is stability. It is in this particular that the aeroplane used alone is uncertain and dangerous. In spite of all the difficulties and

expressed or tacit approval, and may I add that I shall be glad to hear from every person interested in this great subject.—Yours truly,

J. D. ROOTS.

### THE QUESTION OF SPEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the question of speed, will you allow me to answer "W. J. W., A 1299?" This gentleman thinks we are taxed and licensed quite enough; so do I, and that most cordially, but if the French principles were adopted here we should really be in a much better position. We should buy our car, and with it get the maker's statement as to capabilities, &c., which we should hand in to the police, in exchange for which we should receive our "permis de circulation" and numbers. We should then make an appointment suitable to both parties; and on that date we should be examined, and the result of that examination would be that we should, if capable, receive our "permis de conduire," or driving licence, then "right away." How much more sensible this is than the absurd arrangement in force in England of going into a police-station, filling in a form, planking down five shillings, and receiving a driving licence: nobody knows whether the licensee is capable of conducting a wheelbarrow, let alone an automobile. It is simply a contrivance for obtaining the automobile public's money. In the French method, you carry with you two small cardboard licences, each measuring within six inches square; whereas if you obtain a Coventry driving licence this sheet alone is of foolscap size; other towns and counties may not be quite so large; Worcester county,

for instance, is not so large, but of other licensing boroughs and counties I know nothing. Which is the largest bulk to carry, French or English licences, I think it unnecessary to state.

As to twenty miles per hour being fixed as a limit, I cannot but reiterate, that in my opinion it is absurd, all the while under the proviso that a capable driver has charge.—Yours truly,

ALAN A. L. HICKMAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I quite agree with "W. J. W." on the speed question. It has for some time been a pet theory of mine, that before any motor vehicle is allowed to run on the roads of England, it should have its engine so governed that the car cannot exceed twenty miles per hour, and that the penalty for any after interference with this should be so severe as to make it impossible. The advantages we should gain would be many: the makers would turn their attention to giving us still more flexible engines, the gear-box would go, solid or semi-solid tyres would be more general, less dust would be raised, tyre bills would be lower, public prejudice would die, police traps be abolished, and many other advantages will occur to anyone who will think over the matter with a fair and open mind.

I am as enthusiastic about motoring as anyone; I started with a 3½-h.p. Bollée, and have owned and have driven a number of types since, all over England. The one I own now is capable of speeds up to forty-five miles per hour, but it pleases me best to let it purr along at about twenty, making little noise, raising hardly any dust, and causing little annoyance to anyone; if we had all done the same there would not be the present strong feeling against us.

I find in the opinion of many there is no "sport" in driving at twenty miles per hour when double that can be done just as easily. Well, all I can say is, the King's highway is not the place for sport, that should be kept for the race track.

The great B. P. think we motorists are a selfish lot and quite careless for the comfort of others, and one can hardly blame them, after reading some of the letters on this speed question by some of us. Save us from our friends is the cry of many besides.—Yours truly,

D 2783.

## ROAD SIGNS AND LEVEL CROSSINGS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to Mr. Wright's suggestion as to road signs, on page 797, instead of the sign he suggests, I would offer the following as an improvement:—

BRIGHTON	ahead
Redhill	left
Crawley	right

The reverse side of the sign could be similarly utilised. At present the signs are devised in a most annoying way.—Yours truly,

ARMANI.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I would be glad of an opportunity to say a few words on the subject of the dangers of level crossings with railway companies at night.

I have two particular level crossings in my mind when I mention this subject: the one over the L.N.W.R. Co. Northampton-Peterborough line on the Northampton and Bedford road by the Paper Mills, near Northampton; it is called the Bedford Crossing. The other is the crossing at Wareham Station, Dorset, on the Bournemouth-Weymouth road over the L.S.W.R. main line, London to Weymouth. Now, both these crossings are approached at right angle curves at very nearly right angles. Supposing a man is approaching either of these crossings at night; he is unfamiliar with the road, and he is going at a fair speed; he comes round the curve, and the red lamp of the crossing is actually in his face, too late for his brakes to take any appreciable effect, if indeed he has time to apply them; probably he will strike the gates, and then he is indeed lucky if he gets off with a smashed front to his car, and the gates are strong enough to prevent him getting actually on to or overlapping the four-foot. The Northampton crossing I refer to is particularly bad in this respect, as it is scarcely a car's length between the curve and the gates. I suggest that either the road authorities for the district, or the railway company, should be compelled to put up a distant signal, a repeater of the crossing lamp, except that it should show a purple light when "on," instead of red, so that the automobilist should know that it was a distant signal informing him to reduce speed as the crossing signal is on; it should show a green light when "off," so that the automobilist should be made aware that he was approaching a crossing, but that the road was clear as he passed the distant; he would then know that he should keep an extra sharp lookout in case the gateman was actually in the process of shutting the gates and putting the "distant" "on." A better plan still would be to arrange an interlocking system that the gates could not be shut without

the "distant" first being placed "on." This distant signal should be placed about 500 yards in advance of the crossing to be protected.

Of course a simpler but less effective plan would be to place an illuminated sign, "Level Crossing: Motorists Beware:" at the same distance; this, however, to my mind, would not have the same effect upon a driver as it would to see a signal "on" against him.—Yours truly,

A. L. H.

## FOUR v. SIX CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some time ago I entered into a very interesting discussion in your columns with Mr. S. F. Edge, in regard to the merits and demerits of six-cylinder motors. I pointed out that, in my opinion, the six-cylinder motor possessed no features of advantage which were not possessed by a four-cylinder engine, equally well made; while at the same time, in the six-cylinder, many disadvantages were in evidence. The result of the Town Carriage competition recently finished bears my previous statements out to the very letter. Leaving out of the question the electric and steam vehicles, and making the comparison between the petrol-driven cars in the competition for cars costing over £600, what do we find? Fifteen petrol-driven vehicles competed, fourteen four-cylinder, and one six-cylinder, and let us take the judges' awards under the various headings.

(a) General design of complete car. The six-cylinder is placed last on the list, as I assume the judges were of the opinion that the ungainly and abnormal long bonnet, necessary in connection with a

(Tourin, France. LaPorteGayole, Boulogne-sur-Mer.

six-cylinder engine, and projecting out over the front wheels, could not be considered as either elegant or handsome. (b) General appearance and finish of body work. This obviously calls for no comment. (c) Absence of smell and smoke. The six-cylinder takes second place to a four-cylinder car. (d) Absence of leakage of lubricant. The six-cylinder ties with eight other four-cylinder cars. (e) Absence of noise—stationary and running. On this heading we have always been assured that a six-cylinder always scores over a four, and yet the six-cylinder car only tied for second place with a four-cylinder car, another four-cylinder car being placed first. (f) Absence of vibration—stationary or running. Here the six-cylinder gains the award over the four-cylinder by one point. (g) Smoothness of running. No less than nine four-cylinder cars are placed on an equality with the six-cylinder. (h) Ease of cleaning. Seven four-cylinder cars are in front of the six-cylinder. (i) Ease of access for repair. The six-cylinder car is placed second, and I would congratulate the makers on their wisdom in making due preparation under this heading. (k) Ease of starting and smooth action of clutch. The judges on this point were satisfied that nine of the fourteen four-cylinder cars were as good, if not better, than the six-cylinder car. (l) Ease of stopping and changing speed. Ten four-cylinder cars are here announced as being equal to the six-cylinder. (m) Ease of manoeuvring. Here we have a splendid comparison as to the great disadvantages of the six-cylinder car for work in town. The abnormally long wheel base and ungainly proportions of the six-cylinder car in comparison with the handiness of the four-cylinder cars compelled the judges to place twelve of the fourteen four-cylinder cars in front of it. What better argument could be given in favour of a

four-cylinder car for use in town? (n) Comfort of passengers, and (o) comfort of driver, call for no comment, as they do not affect the comparison.

Here, then, is the whole case summed up from results obtained in an official competition, run under the auspices of the Automobile Club and judged by independent judges. Captain Deasy's trial of a four-cylinder car against a six proved some time ago the fallacy of the idea that with a four-cylinder car it was necessary to change speed oftener than with a six-cylinder, and now I think Mr. Edge has proved, through entering a six-cylinder car in the first competition in which the various points set out above have been carefully considered, that so far from a six-cylinder car having advantages over a four-cylinder, it is, on the contrary, not as good—at least as six-cylinder cars are made at the present day.—Yours truly,

CHAS. JARROTT.

### DIFFICULTY IN STARTING ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“C. M.” in the *M.C.J.* of the 3rd inst., offers an explanation which, though it may occur occasionally is, I believe, a very frequent occurrence with the majority of users of De Dion Bouton cars as the trouble almost invariably arises through ignorance of the correct method of adjusting the contact breaker. Anyone who has difficulty in starting a single-cylinder De Dion car should write to the London agents for a copy of their instructions. I am sure if they will follow the same they will have no further difficulty in the matter.—Yours truly,

H. W. H.

Mr. S. F. Edge on the first 16-h.p. Napier, 1901.

### REPAIRING A HONEYCOMB RADIATOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if any reader of the *M.C.J.* could inform me as to the proper way to repair a honeycomb radiator? I have a car in which the radiator is of this type, being built of a multitude of small tubes, and it has sprung a leak that I find myself unable to repair. In using a soldering iron and solder to close the holes, the effect is to loosen all the tubes adjacent to the leak, by melting the solder away from them. I am afraid to attempt any further experiments with the radiator for fear I may spoil it altogether; I suppose, however, there must be some way of effecting a satisfactory repair, and it is with this view that I venture to invite the assistance of brother motorists.—Yours truly,

W. J. JOHNSON.

### MOTOR-BUSES AND THE HOSPITALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am anxious to tender the thanks of all persons interested in this institution to the managers of the six motor-omnibus companies which, till quite recently, used King William Street as a short cut to and from the Strand and Charing Cross Road, W.C.

Having personally pointed out to their representatives, who visited some of the wards and other premises last week, how detrimental to the recovery of our inmates were the unavoidable noise and vibration connected with motors of all sorts, I had the pleasure to receive an assurance that, if after taking counsel together the competing companies found themselves in unanimity, their omnibuses would for the future take some alternative route. Unanimity has prevailed, and now a

sympathetic feeling on the part of the following firms has secured an invaluable boon to many sufferers.

The firms alluded to are:—The London Motor (Vanguard) Company, Ltd., the Associated Omnibus Company, Ltd., the London General Omnibus Company, Ltd., Mr. Henry Turner, 205, Camberwell Road, S.E., and Mr. C. S. Burtwell, 14, Harper Street, New Kent Road, S.E. To these I may add the Pioneer Company, which adopted another route long ago.

Thanking you for your courtesy in finding space for this letter,—Yours truly,

KILMOREY, Chairman.

Charing Cross Hospital, London, W.C.

### THE COURTESY OF MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I had an instance on Sunday week of a further benefit from the Automobile Association. Owing to the makers sending me out from Birmingham with run down accumulators I was stranded on the road miles from any village, and a fellow motorist very kindly offered to get me assistance if he could, and met Mr. Soley, the local road agent of the Automobile Association, some seven or eight miles further on. Although it was pouring in torrents and getting dark, Mr. Soley most kindly came back on his car the whole eight miles to offer me the loan of one of his accumulators, which enabled me to get up to London without further trouble. I feel I cannot allow such an instance to pass without noting it, and would like to thank Mr. Soley again through your columns, if possible.—Yours truly,

R. H. H.

### A PECULIAR IGNITION TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter of Mr. W. Ramsbottom appearing in the *M.C.J.* of the 3rd inst., it was my misfortune recently to experience a similar phenomenon on my own car. Mysterious mis-firing occurred while the car was running, but with the bonnet raised the firing was perfect. After considerable investigation I discovered the cause, namely, that when the bonnet was lowered one side of it came very close to the sparking plugs, and that occasionally the spark would jump from the end of the sparking (i.e., where the wire terminals were screwed on) to the side of the bonnet, causing a mis-fire in the engine whenever the above-mentioned misconduct occurred. The fault was particularly noticeable when the car was running over rough roads, owing to there being a little lateral movement on the bonnet. I had the side-panel of the bonnet slightly altered, and my troubles ceased.—Yours truly,

M. S. 222.

### POLICE REGULATIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is all very well for the motor-bus manufacturers to cry out about the police regulations and say that their trade will suffer, but they do not appear to have had any consideration for the owners of property, the depreciation of which they have helped to cause.

Of course it depends on the point of view. For instance, an owner of house property with no financial interest in motor-buses feels that the roads were formed and houses built long before motors came on the scene. His property is let and he depends upon the income for his living. Then a company is formed and the motor-buses start running. What is the result? Occupiers and owners have to suffer, rents go down and the rates are affected. The bus company, which virtually pays no rates and has no expensive upkeep of a track (like a tramway), is allowed to trade for the benefit of its shareholders and the bus manufacturers. It is no justification for them to say that, owing to the police regulations (which the public are only too grateful are going to be put into operation at last), “labour will suffer.” Consider the other trades already adversely affected by the motor industry.—Yours truly,

H. HARRIS.

### VALVE POSITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much interested in Mr. Anderson's letter on the above subject in the *M.C.J.* of the 13th inst., and venture to give you my views on the matter. Americans seek freedom from worry as to where best to place valves in their favourite two-cycle system by doing without any, and by letting the piston do extra duties in closing and disclosing suitable ports for the admission of vapour and expulsion of exhaust gases. This practice is simple and cheap, and, I may add, inefficient. Simple and cheap, because the parts to manufacture and look after are reduced to an absolute minimum; and inefficient, because the lack of proper scavenging and compression militates against a powerful working stroke. I do not say that they are necessarily wasteful as regards fuel, power for power; but, bulk for bulk and weight for weight, they do not compare favourably with valve-equipped engines, in spite of the claims of their partisans.

Yankees are past-masters in the production of catalogues, and I have often been amused by the nice “working pictures,” supposed to show the action of these two-cycle motors. A sectional view is produced of the cylinder, for instance, wherein a series of arrows indicate the ingress and egress of the gases; and the funny part of the sketch

consists in the contortions of the arrows hurrying round impossible corners and baffle plates in what must be an incredibly short space of time; whilst, on the other hand, the frantic efforts of the last little exhaust arrow to huddle up close to its companions, and keep as far away from the advancing host of induction arrows, almost makes me weep. At the same time, I cannot help wondering why the two bodies of arrows keep so carefully apart from each other, considering that what I presume is intended to represent a more or less perfect vacuum is indicated by a blank space between them. Another fault I have to find with valveless engines is their want of flexibility. It is true that their speed within certain narrow limits may be varied when running light, and within still smaller limits with a very small load on; but, once put them to work in earnest, and they will be found about as elastic as a veteran 'bus horse, as regards variation of pace at which they will pull.

But where the Americans have plumped for simplicity, other brains have struck out in quite a contrary direction. One idea, heralded in some few years ago now with a great spluttering of the ink horn, consisted in cramming three little induction valves in the space usually occupied by one. The theoretical advantages claimed for this depended on the larger combined area of the circumferences of the three valves, as against the area of one large valve within whose circumference they could lie. The obvious practical disadvantages, however, have apparently led to the abandonment of the invention.

And now we come to another complication, the merits of which will certainly not go unchallenged, for it is by no means obsolete, and its adherents number some of the best engine designers of the day. I allude to the practice of using two camshafts with their attendant extra gear pinions, bearings and valve pockets on either side of the combustion chamber. That extra weight, friction and expense are involved cannot reasonably be denied, and it remains to be seen how the opposed arrangement of valves can compensate for all this. Before touching on the question of counter advantages, however, I must in fairness state that neither the extra weight, friction, nor expense are by any means large matters, and that we may concede that a fairly small show of gain, either in efficiency as to working or as to benefit in disposal of parts, should be held as reasonable ground for the complication alluded to.

Briefly, then, the claims for the "double-siders" may be stated as follows:—As to efficiency, an advantage is alleged to be gained by the disposal of the inlet and outlet parts on opposite sides of the combustion chamber. For it is argued that a sweeping or cross scavenging action is set up, in consequence of the momentum of the gases tending in one direction. The high velocity at which the mixture is sucked up one pipe and its consumed products expelled down another forms practically one continuous flow; and as, further, in a well-timed engine there is alleged to be a partial vacuum at the moment of closing the exhaust valve, caused by the force with which the burnt gases have been expelled, it is submitted that any depression thus obtained helps the progress of the incoming charge to sweep across the piston. That there is something in this idea I believe; but, on the other hand, we must not forget that the inlet valve is shut during three strokes of the piston, which should give the mixture ample time to stop and, as it were, rebound, so that in reality the action is pulsating and not continuous. Again, as to any vacuum at end of the exhaust stroke, if it exists in one method it exists in the other, and there is perfect facility during the suction stroke, if the valve and portway are large enough, for a cylinder to get its fill of explosive gas. And, further, we must not forget that having the valves side by side does away with the objectionable feature of double pockets, which are unavoidable with opposed valves. For this reason the ideal position for valves would be in the cylinder head, which, of course, abolishes pockets entirely, were it not that this involves the complication of up-stairs cam-shafts, with all the encumbrances thereby implied.

We now come to the claims of the double-siders as to the advantages of location of such parts as induction pipes and carburettor and exhaust branches, and here I think all who have fitted up engines will agree that if we can avoid crowding everything on one side we gain something worth consideration, and that the opposed valves arrangement must score a point. Of course, with adjacent valves we can carry the carburettor over the other side or anywhere we like by means of a longer pipe, but there still remains the disadvantage of having to do so, and the juxtaposition of the flanges and branches from the contiguous parts of the exhaust and inlet valves to contend with.—Yours truly

A. E. S. CRAIG.

#### AN INTERESTING QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice a paragraph in the *M.C.J.* of the 13th ult. stating that Colonel Fox's car overturned owing to the off wheels rising from the ground when turning a corner. On mentioning this to a friend he said that the near side wheels should have risen when the vehicle turned the corner. Could any readers of the *M.C.J.* enlighten me on this point, as opinions seem to differ?—Yours truly,

CHAS. A. GUTTERIDGE.

A DUBLIN correspondent suggests that those who advertise situations vacant should reply to those applicants who enclose stamped addressed envelopes.

## CLUBS AND ASSOCIATIONS.

### MANCHESTER.

THE Manchester Automobile Club held their first soiree and reunion of members during the winter recess on Wednesday of last week, at the Midland Hotel. About 150 members and friends were received by the President, Mr. J. A. Morris, and Mrs. Morris. The small concert hall was converted into a cafe chantant for the time being, and a most enjoyable evening was spent. The committee are arranging a house dinner and smoking concert for Tuesday even ng. December 11th.

THE Yorkshire Automobile Club inaugurated their winter session with a successful smoking concert at the Hotel Metropole, Leeds, on the 9th inst. The chairman of the club, Mr. E. H. Hepper, occupied the chair, and during the intervals in the musical programme called attention to the various gatherings which would be held in the ensuing winter.

THE annual dinner of the Motor Yacht Club will take place at the Savoy Restaurant, London, on the 20th inst.

THE Clyde Branch of the British Motor Boat Club is growing very

From a Caricature

Madame du Gast.

(in "Le Chauffeur.")

rapidly. Mr. Percy Lowcock, one of the founders, has had to retire from the hon. secretaryship owing to pressure of business, and his post has been taken up by Mr. P. W. Dunlop.

THE members of the Notts. Automobile Club gathered in strong force at the Black Boy Hotel, when the winter session was inaugurated in the usual way by a supper and smoking concert. Mr. A. Barlow occupied the chair, supported by Messrs. G. H. Kirk, A. Metheringham, J.P., Booth Granger (hon. secretary), M. Ross-Browne, B. W. Winter Dr. A. Barron Goss, Dr. R. G. Hogarth, H. Bircumshaw, and others.

### A PARSON'S LOST TEMPER.

THE Rev. A. Langdale-Smith was summoned at Bullingdon for assaulting W. J. Adcock, chauffeur, at Forest Hill on October 30th. Adcock was driving towards Oxford with Lord Vernon. They overtook a trap, and as the car passed the occupant slashed him with the whip across the face. The trap was in the middle of the road, and the car was slowed up well on the inside, and the horn blown. Defendant said he was allowing the car a good half of the road. He admitted that he lost his temper, and struck out with his whip, but it was under provocation. The pony was frightened by the sound of the horn, and became very restive. Fined 10s. and 8s. costs. Defendant: I hope the gentleman will accept my very sincere apologies.

## CASES UNDER THE MOTOR-CAR ACT.

### SECTION 1.—RECKLESS DRIVING.

Described as chauffeur to Sir Clifton Robinson, William Liddington, of Hammersmith, answered a summons at Kingston-on-Thames Police Court on the 8th inst., for driving a motor-car to the danger of the public at Surbiton. Mr. W. G. Gritten, a barrister, stated that he was cycling with Mr. A. Langden, K.C., along the Ewell road towards Surbiton when the motor-car, driven by the defendant, dashed by at a furious pace, nearly brushing against the witness's right arm. His friend took the number of the car, which appeared to be of a racing type, and then called and reported the case to the police on public grounds. Mr. Langden, K.C., said that when he heard the car coming up behind he knew it was going furiously, and he at once decided to take its number. If anyone had been riding in the middle of the road at the time he would assuredly have lost his life. The defendant said that his speed did not exceed more than fifteen miles an hour, his car was of 135-h.p., and seated two persons. The chairman said that in his opinion this was about the worst case that they had ever heard. (Addressing the defendant): In our opinion you are not a fit and proper person to have charge of a motor-car, and the public are not safe with a man like you on the road. You will have to pay a fine of £10 and £1 costs, and your licence will be endorsed and suspended for three months. The magistrates declined to hold over the endorsement of the defendant's licence for one day in order that he might drive the motor-car home.

In Edinburgh Sheriff Court Hans F. Kufek, of Glasgow, was charged with having driven a motor-car recklessly or negligently on the South Bridge, Edinburgh, whereby Alexander Cook was knocked down and had his nose and cheekbone fractured. The accused pleaded not guilty. Accused in his evidence said he saw Cook about fifty yards off, and sounded his horn twice. Cook then looked round, and witness swerved to the left, but on seeing Cook retrace his steps he swerved to the right. But for Cook losing his head the accident would not have occurred. His Lordship, in finding the charge proven, said he was satisfied that the car had been driven recklessly. Whatever the distance was at which the injured man was seen the real point was that the car reached him in too short a period, and was thus driven too fast. He had no doubt Kufek did all he could to avoid Cook. The maximum penalty was £20, but in this case he would limit the fine to one of £5.

Sir Clifton Robinson, Chairman of the London United Electric Tramway Company, appeared at West London Police Court on Monday to answer a summons for driving a motor-car along Holland Park Avenue in a dangerous manner. Mr. Hanson, for the defence, said that the motor-car was a Mercedes racing car, capable of going at the rate of 100 miles an hour at top speed, and was 135 horse power. The maximum speed at which the motor-car could go on its lowest speed throttled down and not accelerated was fifteen miles an hour, while the minimum speed of the second speed was about forty miles an hour, so that it could not go at the rate of twenty-seven miles an hour, as alleged by the police. The defendant gave evidence to this effect, and he was confirmed by Mr. J. E. Hutton, who stated that if a man attempted to drive such a motor-car beyond the maximum pace of fifteen miles an hour on the first speed he would ruin the motor-car. The magistrate said he was not satisfied that the motor car was going at the rate suggested by the police or in a manner dangerous to the public, and dismissed the summons.

### SECTION 2.—REGISTRATION.

Mr. Theodore Ridge, of Clement's Inn, Strand, appeared before Mr. Fenwick at Bow Street Police Court on Saturday to a summons charging him with driving an unregistered motor-car on a public highway. Mr. R. J. Drake, who defended, said the car in question had been manufactured by the Pull-car Company, of Preston, and it was claimed for it that, owing to its novel construction, it would not skid. A syndicate, of which the defendant was the director, proposed to put 500 of these cars on the streets of London to be used as cabs, but before they did so they desired to put the car to a thorough test. For that purpose it had been driven about 4,000 miles along the most crowded and most greasy streets in London. No one but members of the syndicate and their friends had used the car, except on one occasion when an intending purchaser tried it. The car bore the general identification mark of the manufacturers, and he contended that that was quite sufficient while it was being used for trial purposes only. The defendant gave evidence in support of this statement. He said the car had been submitted to the Scotland Yard authorities on two occasions, and they raised no question as to the general identification mark.

Mr. Fenwick said that what constituted a trial in a case of this kind was a question of fact and also a question of degree. There must, of course, be a limit to the period during which a car could be said to be on trial, but although this car had been driven for some weeks he regarded it as a bona-fide trial, and the summons would be dismissed.

### SECTION 3.—THE SPEED LIMIT.

At the Worthing Petty Sessions, on Wednesday of last week, Mr. Edward Manville was summoned for driving a motor-car at a speed beyond the legal limit, on the Findon main road. Mr. W. P. Cogan prosecuted, and Mr. Staplee Firth defended. P.S. Payne deposed to timing the car over a measured quarter of a mile. The distance was covered in 35 sec., representing 25 miles 1,257 yards an hour. The car

was stopped by signal, and defendant said "Surely you won't summon me for five miles?" Witness replied, "It's nearly six." In cross-examination, Mr. Staplee Firth referred to a collision which followed the stopping of Mr. Manville's car, in obedience to a signal, and as a result of which, the witness admitted, a motor-cyclist who was riding close behind was thrown senseless on to the side of the road. Witness could not see, from his position behind the hedge, the motor-cyclist at the rear of the car. Defendant, giving evidence on his own behalf, said he was a consulting engineer, and had travelled thousands of miles by motor-car in England and Europe. He was a frequent visitor to the South Coast, and especially Brighton and Worthing. After he had pulled up in response to the police signal, he felt something crash into the back of the car. He told the sergeant that he had no right to deliberately stop the car and thus cause an accident. He was confident from his speedometer that the speed of his car never exceeded twenty miles an hour. The Bench retired, and, after some few minutes' consultation, the Chairman said they considered there was a doubt, and that defendant was entitled to the benefit. The case would be dismissed, and no order made as to costs. A great deal had been made of the unfortunate accident. It had been clearly proved by the evidence that no blame attached to Sergeant Payne, as he could not possibly have seen the motor-bicycle behind the motor-car.

At Snaith, George H. Reynolds, chauffeur to Mr. Stanley Wilson, M.P., was summoned for driving a motor-car at twenty-nine miles an hour on August 17th on the Selby and Doncaster road at Eggborough. For the defence, the defendant said that within twenty-four hours he was told three times of the trap. His employer and himself were journeying from London to Hull, and they were told at the Doncaster Motor Garage, and by a man working on the Eggborough railway crossing, which is less than half a mile distant from the trap. He knew its exact position, having passed through it on six previous occasions. There was a speedometer on the car. Throughout the journey through Eggborough this instrument indicated a speed of seventeen and eighteen miles an hour. It had been proved to be accurate both before and since the incident. Mr. H. Wray, of Hull, said that Mr. Wilson was most desirous to come to the court to testify on oath to the extreme care and caution with which the defendant had always driven him, but he regretted that he was kept away on important business in London. Defendant, who had two previous convictions, was fined £3. Three other defendants were fined £1 each.

At the Greenwich Police Court a speed of 36 miles 510 yards an hour was alleged against Henry Ray Anderson, of Sainsbury Road, Gipsy Hill, Upper Norwood, summoned before Mr. Baggallay for exceeding the speed limit. The defendant said the offence was committed unwittingly. He did not think he was doing more than twenty miles an hour. Mr. Baggallay.—If you cannot judge better than that after driving for three years you ought not to have a licence. This is a bad case. Pay £5 and costs.

## THE HORSE-POWER RATING OF PETROL MOTORS.

WE have received the following communication from the Automobile Club of Great Britain and Ireland:—

There appears to be a general desire that the A.C.G.B.I. should officially issue a simple formula which shall serve as a rating for internal combustion engines such as those in common use on self-propelled vehicles—that is to say, engines of the ordinary single-piston four-cycle type using petroleum spirit as fuel. This rating is required so that the public may arrive at the approximate power of any given engine in comparison with others. There is, obviously, only one accurate way of determining the effective h.p. of any particular engine, and that is to try it on the brake. For the purpose, however, of a general rating formula, an approximation will suffice; indeed, it is the only thing possible, owing to the many variable factors which affect the power developed by any engine.

In a formula for rating purposes it is desirable to eliminate, as far as possible, the various factors which affect the h.p. Horse power is a matter of foot-pounds per unit of time, and resolves itself, in a motor-car engine, into pressure on, and the linear velocity of the piston. The linear velocity of the piston is the product of the stroke and the number of revolutions. It being assumed that all makers aim at supplying the most effective mixture from their carburetors, the maximum pressure on the piston depends on the ratio of the compression space to the volume swept by the piston. This ratio varies but little in most types of modern motor-car engines. The high limit of compression is reached when pre-ignition of the charge occurs, and the low limit need not be considered; but, as a matter of fact, most designers aim at about the same degree of compression, and, if this be admitted to be the case, then this factor may be eliminated from the formula.

The maximum linear velocity which can be prudently and economically employed is fairly well established at the present time, and it can safely be said that the best constructors are working approximately to the same figures. For the purpose of the "A.C. Rating Formula" the linear velocity of the piston is taken as a constant and the formula correspondingly simplified. There remains, therefore, as a basis for the rating formula, the area of the piston only, and this is proportional to the square of its diameter ( $D^2$ ): so the formula resolves itself into  $\frac{D^2 \times N}{X}$  where N is the number of cylinders: D the diameter of the piston in inches, and X a constant. The numerical value of this constant depends solely upon the allowance which it is

determined to make for the variable factors already referred to. If this allowance be small, so that the result obtained shall approximate to the maximum horse-power obtainable from any given engines, two would not appear too small a figure. If two be taken, then the h.p. of a four-cylinder engine of four-inch bore would be rated at thirty-two, which is approximately the h.p. which could be obtained as a maximum from such an engine; if three be taken, then 21-1-3-h.p. is obtained, which is a low figure for the result which such an engine should give on the brake. A constant giving a result mid-way between the maximum and minimum limits which may be expected from engines of the highest or commonest designs respectively has therefore been adopted, and 2.5 will be found reasonable and sufficiently accurate for all comparative purposes.

The Club has therefore decided to adopt as the "A.A. Rating Formula"  $\frac{D^2 \times N}{2.5}$  or 2.5 of D<sup>2</sup> N. This formula is for a "rating" only, and is not to be considered as an accurate or scientific calculation of actual horse-power. The Council of the Society of Motor Manufacturers and Traders have recommended the members of the Society to adopt the formula for their catalogues.

### THE FLORIDA RACE MEETING.

As already announced in the *M.C.J.*, the annual race meeting on the Ormond-Daytona Beach, Florida, is to be held from the 22nd to the 27th January next. From a copy of the programme which has been furnished

In our issue of the 27th October last we gave an illustration of the first Wolseley motor-vehicle, built in 1895-96. The above illustration depicts the second experimental machine; it was constructed in 1897, and was fitted with a 3-h.p. horizontal engine, having two cylinders 2½ in. bore by 4 in. stroke, and tube ignition; the power from the engine to the gear-box was transmitted by belts. Two sets of shoe brakes, operated by foot and hand levers, acted on rims bolted to the rear road wheels.

us by Mr. S. F. Edge, we learn that the open-to-all events comprise a mile race with flying start for the Dewar World's Championship trophy; a flying mile for petrol cars; two miles "Two miles-a-minute," flying start; five miles International World Championship record race; ten miles, standing start; ten miles handicap; fifty kilometre record race, flying start; sixty miles, open to all American entries in the 1906 Vanderbilt Cup race; 100 miles Minneapolis International World's Championship.

The touring car events will be:—One mile American Championship "mile-a-minute," cars to carry at least four passengers, flying start; five miles, £300 or less, cars designed for four or more passengers, standing start; five miles, cars between £300 and £600, for four or more passengers, standing start; five miles, cars between £600 and £1,000, for four or more passengers, standing start; five miles, cars over £1,000, to carry four or more passengers, standing start; ten mile handicap; thirty mile, all classes, American championship, first three to represent the United States in the International Touring Car Championships.

The following events will be confined to amateurs, the owners to drive:—One mile, all classes of petrol cars, standing start; five miles touring cars all classes, standing start; five miles, all classes, standing start; ten miles, all classes, standing start; ten miles cars of 50-h.p. or less, best average of three races, standing start. There will also be a thirty mile open race for all classes of foreign touring cars; the first three to compete in a thirty miles International touring car championship. Facilities will be provided for record trials by all classes of cars entered in the races at the following distances: one kilometre, one mile, five miles, ten miles.

### STRIKE OF MOTOR-BUSMEN.

ON Friday of last week some of the employees at four of the garages of the London General Omnibus Company struck work. The dispute originated in a proposal to establish for the drivers a system of grading. Up to the present the wages of a driver have been fixed at 7s. for an eleven hours' day. Under the new scale it is proposed to pay men in the three grades to be established 8½d., 8d., and 7½d. per hour respectively.

On the part of the men it was urged that the proposed system of grading placed the men at the mercy of the officials. Moreover a twelve months' agreement was required by the company.

At a meeting of men the following demands were formulated:—One grade of driver, at 7s. per day of nine hours, with a Sunday of 13½ hours, at 10s. 6d.; any agreement as to terms to be made with the union. No deductions of pay for accidents. Half-pay per hour for overtime when men are left stranded on roads, beyond usual time. More time for each journey, to obviate exceeding of the speed limit. Half-hour daily for meal.

The trouble began at the garage at Cricklewood, and extended to those at Mortlake and Acton until nearly one hundred and fifty omnibuses were affected and by Monday the following routes were affected:—Cricklewood to Elephant, Cricklewood to Victoria, Finchley to Oxford Circus, Barnes to Liverpool Street, Child's Hill to Victoria.

During Tuesday the directors met a deputation of the men, who told the board that they would not accept the journey system, and insisted upon being paid 5s. a day instead of 3s. 6d. whilst the cars are

being laid by in garage. They also asked that they might be allowed half an hour at some point of the road or between the journeys during which time they might get a square meal. The men's arguments were listened to with attention by the board, who promised that they would give the matter their careful consideration and let the men know the result.

Out of a total of 154 buses, 50 were running on Tuesday.

### MOTORIST v. MOTORIST.

In the Berwickshire Sheriff Court at Duns, Mr. Charles H. Benton Knutsford, Cheshire, has been charged with wilfully preventing hindering, and interrupting the free passage of a motor-car on the public road between Lander and Earlston. The evidence for the prosecution went to show that in the dark accused, while driving his motor-car, was overtaken by a car belonging to Mr. C. B. Balfour, M.P., travelling from Edinburgh to Newton Don. The chauffeur of the Newton Don car signalled that he wanted to pass, but accused persistently prevented a passage by keeping his on the centre of the road and swerving from side to side. A herd of cattle having been met, Mr. Benton's car suddenly stopped, and the Newton Don car, unable to draw up in time, ran into it and a slight collision took place. The evidence for the defence was to the effect that the front car was at full legal speed, and that the condition of the road made it dangerous to attempt to allow another car to pass. Sheriff Dundas found the charge proved, and fined accused 21s. An appeal to the High Court of Justiciary was intimated.

## PUBLIC MOTOR SERVICES.

THE Richmond Corporation have made representations to the Home Secretary and the Chief Commissioner of Metropolitan Police on the subject of the nuisance caused by motor-omnibuses plying between London and Richmond on Sundays. Residents of Barnes and Mortlake are signing a petition to the Surrey County Council in similar terms.

In view of the agitation in and about Manchester against motor-buses, the trial of a Ryknield motor-omnibus last week attracted much interest. A party of members of local governing authorities was taken from Manchester to Lower Peover, through Alderley Edge, returning by way of Knutsford, when all who had participated in the run concurred in the opinion that the bus had passed the experimental stage, and that the general comfort of the passengers far exceeded the most sanguine anticipations.

THE Southport Company Housekeepers' Association have adopted a resolution protesting against motor-cars being allowed to ply for hire on the Promenade.

THE Highways Committee of the London County Council has reported that three motor-vehicles have collided with the parapet of Waterloo Bridge since October last; and, in consequence, they suggest that the attention of the Local Government Board and the Commissioner of the Metropolitan Police should be called to the control of motor-bus traffic over Thames bridges.

At the Hove Borough Bench, on Monday, Charles Ayling, of Brighton, was summoned for "using a certain locomotive upon the highway called Church Road, Hove, on November 2nd, which did not consume so far as practicable its own smoke." P. C. Brown stated that he saw the defendant driving a motor-bus along Ventnor Villas, which was emitting a large quantity of smoke. He spoke to the defendant, who said, "I can't help it, I have just brought her out of dock." Witness watched the bus along Church Road, and saw it continue to emit smoke in such quantities that he could hardly see the back of the vehicle. The Chief Constable (Mr. T. Davies) said this was the first case of the kind brought before the Court, whose decision in the matter therefore would be very important. Mr. Trangmar pointed out that the proceedings were taken under section 30 of the Locomotives Act, which applied principally to traction engines and such like heavy vehicles, and which the Motor Car Act of 1896 had repealed. By this last named Act an exception was made in favour of vehicles so constructed as to consume their own smoke "except from any temporary or accidental cause," and the motor-bus was such a vehicle. The bus in question was on its first journey and the smoke had stopped before the bus had got to Castle Square. He submitted that the smoke was due to a "temporary or accidental cause," and explained that the company took very great precautions to prevent undue smoking. The magistrates retired to consider their decision, and, on their return, the Mayor said the defendant must pay a fine of £1 and costs, or seven days. Mr. Trangmar said he wished to appeal, and asked the Bench to increase the fine to £2 ls. to enable him to do so. To this the magistrates agreed.

AN extraordinary general meeting of the Manchester District Motor Omnibus Company (Limited) was held at Cannon Street Hotel, London, on Tuesday, for the purpose of considering a resolution for the voluntary winding up of the company and the appointment of Mr. E. I. Husey, of 58, Coleman Street, E.C., as liquidator. This service was started in July last and ran for five or six weeks, when an extension of the route was decided upon. Then a local outcry arose and a deputation waited upon a committee of the Manchester Corporation. A resolution was passed recommending the Watch Committee not to grant any further licences, and that those already granted should be allowed to lapse. That decision had, to all intents and purposes, closed the Manchester district to companies running motor-omnibuses. There was little else to do, and considering that their licences would lapse in about fourteen days' time, they at once withdrew the service and began to cut down expenses. The directors had discussed the position with many of the larger shareholders, and had decided to wind up the company and go into voluntary liquidation, thereby saving as much money as possible. There were a certain number of buses which belonged to the company, and these would have to be sold for what they would fetch. He concluded by moving a resolution in favour of the voluntary winding up of the company, which was seconded and adopted.

## NEW COMPANIES REGISTERED.

LONDON MOTOR-CAR COMPANY.—Capital, £5,000. To take over the goodwill and connection of Mr. J. R. Fawcner in the business of an engineer, motor-car expert, &c. 1, Cathedral Mansions, Vauxhall Bridge Road, S. W.

ALL-BRITISH CHASSIS BUS COMPANY.—Capital, £100. Public issue. Messrs. W. Tattersall and B. M. Goode.

LAYSTALL MOTOR ENGINEERING WORKS.—Capital, £2,000. To acquire the business carried on by Messrs. F. T. Bersey and S. O. Eade at 27 and 29, Laystall Street, Rosebery Avenue, London, E.C.

DURAX DUSTLESS ROADS.—Capital, £50,000. To adopt an agreement with the Granite Patents, Limited. First directors, Messrs. G. Briggs, H. Edmunds, H. J. Grace, F. M. Manuells, W. M. Roscoe, P. A. Shaw, A. H. Wheeler, and J. G. Simpkin.

MOTOR TYRE AND RUBBER MANUFACTURING COMPANY.—Capital £60,000. To acquire the business carried on by the Empress

Manufacturing Company, Ltd., at 7A, Upper St. Martin's Lane, W.C., and at Hythe Works, Willesden, as the Motor Tyre Manufacturing Company. Address, Hythe Works, Hythe Road, Willesden, N.W.

## ROAD REPORT.

CHESHIRE.—At the last meeting of the Cheshire County Council, Alderman Sandbach (chairman of the Main Roads Committee) declared that a stretch of the main road from Manchester to Chester in the Knutsford district had been seriously damaged by dust-laying experiments. When wet weather came the road broke up and became perfectly rotten. The county surveyor estimated that it would cost about £500 to remake the road. Chloride of calcium had so far proved the most satisfactory dust-layer.

## MOTOR-CAR ACCIDENTS.

DR. WALDO, the coroner for the City, has just held his first inquest on the victim of automobile traffic in London. The jury returned a verdict of "Accidental death" and attached no blame to the driver of the motor-omnibus.

ON Tuesday evening a motor-car belonging to Mr. G. H. Robertson, of Plas Newydd, Llangollen, while going along the Wrexham Road, near Chester, ran over a man lying on the roadside, inflicting such serious injuries to his head that he died shortly afterwards at Chester Infirmary.

## POLICE TRAPS.

THE chief constable of Shropshire has issued a warning that motorists who drive recklessly may expect drastic measures to be taken against them in that county.

AT Eggborough, on the Selby and Doncaster road, is a police trap in frequent operation.

THERE is a measured furlong in the Kennington Road, London, S.E., over which the police frequently time motorists.

## LOCOMOTIVE OR MOTOR-VEHICLE.

THE appeal of Garrett v. Lingley from a decision of the magistrates at Woodbridge, Suffolk, recently came before the Lord Chief Justice and Justices Lindley and Darling as a Divisional Court. Mr. Leslie de Gruyther and Mr. Ernest Charles (instructed by Mr. Arthur Hunter) appeared for the appellant and Mr. Stewart (instructed by Mr. Wood) for the respondent, the superintendent of police at Woodbridge. Mr. Charles stated that on May 22nd last the appellant was driving a motor tractor owned by Messrs. Geo. Powdrill and Son, of Luton, through Woodbridge when he was stopped by a police-constable and subsequently summoned under Section 9 of the Locomotives Act, 1898, for using a "Locomotive" not duly licensed. On the hearing of the summons the motor licence issued by the Bedford County Council was produced by the owner of the tractor, and it was in evidence that the car had been constructed to work under the heavy Motor Car Act. It was contended that the tractor was a motor-car within the meaning of the Locomotives on Highways Act, 1896, and the Motor Car Act, 1903, and therefore was not subject to the provisions of the Locomotives Act, 1898. It was also urged that the registration as a heavy motor-car was sufficient evidence to exclude the application of the provisions of the Locomotive Act, 1898, and that the occasional emission of smoke deposed to by the prosecution was not relevant to the particular charge. The Bench, however, convicted the defendant and inflicted a fine 10s. and 15s. 6d. costs.

After hearing counsel for the respondent the Lord Chief Justice delivered judgment, stating that there was no evidence upon which the magistrates could come to the conclusion that the tractor in question was not constructed in the manner required by the Locomotives on Highways Act, 1896, and the Motor Car Act, 1903. His Lordship stated that the certificate of registration issued under the provisions of the Motor Car (Registration and Licensing) Order, 1903, was not in itself conclusive evidence of proper construction, but such registration did raise a prima facie case which in the present instance had not been rebutted. The conviction would be quashed and the appeal allowed with costs.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

# THE Motor-Car Journal.

VOL VIII.]

LONDON, SATURDAY, NOVEMBER 24, 1906.

[No. 408.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

LIKE the dragon that preys upon all obstacles in its way, the desire to bring everything into a common ownership seems to invade all shades of thought, and now Mr. J. C. Wedgwood, M.P., has been suggesting that the manufacture of motor-cars should be undertaken by the Government. The proposal is not intended to utilise the knowledge of cars possessed by such men as Major Holden and Major Lloyd in the common interest, nor has it any association with the leakage from the Army to the motor trade that has taken place of late; but it is made on the sympathetic basis of finding work for the labourers and others who have been, and are being, discharged from Woolwich Arsenal. Hence the question addressed by Mr. Wedgwood to the Secretary of War on Monday, asking him to consult with the Postmaster-General as to the manufacture of bicycles and motor-cars at the Arsenal for the use of His Majesty's postal service. Mr. Haldane gave a common-sense and decisive reply. The question, so far as it related to bicycles, had been considered and dismissed. And then, added the War Minister, "the arguments against the manufacture of bicycles at the Arsenal apply to a greater extent to motor-cars"—a proposition that will be appreciated by all who are cognisant of the subject. Still the young M.P. kept to his point, giving instances where ordnance works had taken up "side lines," until Mr. Haldane was forced to closure the discussion by remarking upon the financial difficulties that had frequently attended such experiments. Far better is it that the public services of the country should have a wide range from which to select vehicles for the particular requirements of each Department than that they should waste the taxpayers' money in the endeavour to establish an official type in the assembling of which red tape and other unnecessary accessories would probably play a part. Mr. Haldane's firmness in at once dismissing the matter will be acknowledged in many other circles besides those associated with the motor-car.

### A Show Question.

MANY exhibitors at the Show have been chagrined at the restricted areas of their stands, and also at the manner in which they have been induced to take space. They hoped for adequate representation of their interest; but when we consider large firms with extensive selections of accessories have been cut down to most meagre displays, there need be no surprise felt at their sense of disappointment. This, however, is not shared by those exhibitors who wisely retained their freedom of trade and who declined to be bound to show only in one place. They have now the advantage of the publicity gained at Olympia to attract the public to their stands at the Agricultural Hall Show at the beginning of the next selling season. With regard to that Exhibition many new models are assured, several makers of cars having been unable to get their vehicles ready before the spring.

Hence an important factor in the continued success of what was the pioneer of the motor trade exhibitions, and which is still recognised as the inauguration of the actual selling season of the year.

### No Taxation by h.p.

AMID the plethora of after-dinner speeches to which all associated with Motorism have been compelled to listen during recent days there has been a danger of some really important pronouncements being lost. One at least deserves more than a passing word, viz., the declaration of Mr. Walter Runciman, the Parliamentary Secretary of the Local Government Board, to the effect that there will be no taxation by horse-power—a view subsequently approved by Major Cole on behalf of the provincial motorists, and referred to by the Hon. Arthur Stanley on the following day as of great importance. It is very satisfactory to know that the officials of the responsible Department have rejected this method, which, had it been seriously regarded, might have wrought considerable mischief to the industry. At a time when the production of high-powered cars seems to be the great desire of makers, the idea of the imposition of a tax by horse-power cannot have a good effect, and Mr. Runciman deserves the thanks of all engaged in the industry for the statement he made—apparently with full recognition of his responsibility in the matter.

### The Position of the Industry.

WITH reference to the present prosperity of the automobile industry some interesting figures were given by the Hon. Arthur Stanley, M.P., at the luncheon which inaugurated the show now in progress at Olympia. He calculated that the British production of motor-cars during the past nine months had totalled three millions sterling, while the imports of vehicles had exceeded that sum by half a million. Mr. S. Straker, in voicing the sentiments of the Society of Motor Manufacturers and Traders, pointed out that they had been in negotiation with many Government Departments during the year, and that there was generally a disposition among those in official positions to regard the automobile industry as one of the institutions of the country—a very different attitude to the original prejudice with which it was assailed.

### A Scottish View of English Methods.

THE interest aroused by the legal decision in the case of *Bastable v. Little*, recently chronicled in our columns, is by no means confined to the English side of the Border. A Scottish reader calls our attention to a leading article upon the judgment in the "Glasgow Herald," which explains that "it is a little difficult for the Scottish motorist to appreciate the importance of the case; and it is still harder for the Scottish non-motorist or anti-motorist to understand the degree of interest that is aroused by the judgment, because on this side of the Border the motor-trap is a most uncommon object of the roadside." The many technicalities of the matter are cogently discussed, and then our contemporary goes on to say, with

intelligent appreciation of the position:—"It is not that the Scottish driver, on the open road, is guided by an unctuous rectitude to which his English brother is a stranger. Police traps are rare in Scotland, because we do not believe that the force is maintained for the manufacture of technical offences, nor do we regard motorists who exceed the limit, without endangering or inconveniencing other road users, as outlaws to be bled freely for the relief of local rates. But in the south motor-trapping is a sport pursued in many districts with energy and zeal. In some localities, such as the notorious borough of Andover, it is not so much a sport as an important local industry."

#### An Australian Trial.

LAST week the Dunlop Reliability Motor Contest was held over 1,000 miles of the best roads in Victoria, six days being allowed for the trial. There were four classes, viz., A, for single-cylinder cars; B, for multi-cylinder cars with a total piston displacement of not more than 130 cubic inches—equivalent approximately to 13-h.p. at 1,000 revolutions; C, for multi-cylinder cars with a piston displacement ranging from 131 to 200 cubic inches; and Class D, for cars with a total piston displacement of over 200 cubic inches—approximately over

Gabriel on the 120-h.p. De Dietrich Racer he drove at Blackpool.

20-h.p. at 1,000 revolutions. The formula used for determining the total piston displacement was as follows:—

$$\frac{\text{Bore in inches (square)}}{4} \times \frac{22}{7} \times \frac{\text{Stroke (in inches)}}{1} \times \frac{\text{Number of Cylinders}}{1} = \text{total piston displacement.}$$

The event was won by a 12-h.p. Darracq, fitted with Continental tyres.

#### The Police and Public Services.

UNQUESTIONABLY the streets of London are quieter than they were a few months ago, and it is apparent that the absence of many of the motor-buses that were then plying on the roads is partially responsible for the comparative calm that is now our lot. Many designers and makers naturally desirous of getting their vehicles into early service hurried things forward only to find the public carriage department at Scotland Yard prepared to reject them altogether. A few hundred vehicles are now awaiting police sanction, and the amount of capital thus lying idle is a serious drain on the firms whose enterprise led them into this branch of motorism. Fortunately the police authorities have been accessible, and have, to a great extent, taken the makers

into their confidence by the circulation of draft regulations for criticism before finally taking a decided stand. The revised Regulations were issued last week—their publication synchronising with the public utterances of Sir E. R. Henry, the Commissioner of Police, on the subject. At the conference between the public and the motor-bus interests in January, regulations with regard to structural details were settled on fairly unanimous terms, but the provision as to "undue noise" left occasion for contention; and, as has been proved in practice, has been the cause of difference ever since.

#### A Standard of Noise.

THERE is, as yet, no standard of noise and Sir E. R. Henry is now trying to secure such a desideratum. As he told the Society of Motor Manufacturers and Traders last week, he is in consultation with a scientist who is devoting his abilities to solving this problem, and who is in communication with Lord Rayleigh. Hitherto they had been compelled to judge noise by the effect that it produced upon the auditory senses of those whose business it was to give a decision. A noise might produce upon one man an irritating effect that it would not produce upon another. They had taken that into account, and had arranged that the omnibuses should be tested by several officers. When the vehicle was brought up it was tested by the Superintendent of the Public Carriage Department, and his decision would be reviewed by a committee of three, two of whom were in no way connected with the Public Carriage Department. When an omnibus, already licensed, became a nuisance, owing to over use or want of care, they did not order it off the streets at once, but got a report from the officer who had visited and watched the place where it ran. They did not accept his report until it had been tested by another officer, and when those reports agreed as to the defects of the omnibus, they issued precautionary notices requiring the owner to remedy the defects, under the penalty of his omnibus being forbidden to ply until it came up for re-inspection.

#### Ladies and the Cars.

LADIES' days at Exhibitions are always a popular feature of such displays providing the opportunity for a little relaxation from the ordinary hours of business. And that organised by the Ladies' Automobile Club on Thursday was no exception. The ladies are as keen motorists as the men, and although they may lack the mechanical knowledge, and the practical acquaintance with the disagreeable details of breakdowns, they take a real interest in most things that appertain to automobilism. They appreciate the social side of club life as developed in the country; they had their place at the anniversary dinner last week, and their influence is the reason of many of the little fitments to be seen on modern cars. Of course they look first at the upholstery and coachwork of cars, but a great number want to see much more than that, and their motor catechism is becoming more and more extensive.

#### Llandudno Speed Limit Refused.

THE Motor Union and the A.C.G.B.I. have been successful in their opposition to a proposal to establish a reduced speed limit for motor-cars on certain streets in Llandudno. The County Council of Carnarvon applied to the Local Government Board for an order to reduce the speed to ten miles an hour, and a local inquiry was duly held, at which the Secretary of the Motor Union attended, and opposed the application on behalf of the Union, the A.C.G.B.I., and the North Wales Automobile Club. The Motor Union have now received a letter from the Local Government Board, in which they state:—"That having regard to the circumstances of the case, and after consideration of the report of their inspector, the Board have informed the County Council of Carnarvon that they do not feel able to comply with their application, at any rate to its present extent. Upon this both the motorists of Wales and the non-motorists of Llandudno are to be congratulated."

### A Chance for Local Bodies.

INSPIRED by the offer of substantial prizes of £100 and smaller sums, the townships of the County of York, in Canada, are setting their roads in order. The Toronto Automobile Club has devised this scheme of prizes in order to induce the local authorities to improve their roads. The awards will be paid to the authority which secures the best improvement of one mile of road, regard being paid to the drainage, serviceable width, finish of surface, smoothness, and permanency of construction. The idea is that the prizes obtained shall be devoted to further improvements, so that the Canadian automobilists are doing a really useful work; and, it is satisfactory to learn, the authorities are accepting the challenge in the most public-spirited way.

### The Loss of a Livelihood.

WE do not extenuate the offence which has caused a chauffeur to be deprived of his licence to drive a motor-car; and also prevented him from obtaining a renewal for four months after the expiration of the licence now suspended. The case is briefly mentioned on another page, and seems to have been a bad one; but the matter is of general interest, for it is

up a petition against the suggestion, and quickly got sixty signatures. Then a meeting was held, and a dozen motorists, recognising the value of unity in preserving their interests, established the Harrogate Club, of which Dr. Ozanne is the president, while other good workers for the cause have been Dr. Holroyd, Mr. Birtwistle, and Mr. King. Local organisations like that at Harrogate are doing really great service to the automobile movement throughout the country.

### The Development of the East.

IN the development of eastern countries the motor-car will play a useful part, and anything tending towards its encouragement deserves consideration. Hence the interest of the meeting of the East Indian Association the other day, when Mr. Parveez, a Parsee citizen of Bombay, gave his views as to the possibilities of developing Indo-British trade with Persia. He attributed the non-expansion of British trade with Persia mainly to the absence of good communications, and suggested that a much more feasible project than an extension of the Queata-Nushki line to Seistan would be a motor-car service. In association with an English gentleman he had applied to the Indian Government for a motor-car concession to cover this route, but they were met with a flat refusal. Russia, on the

[Mrs. J. S. Turnbull.

almost the first time that a Bench has seen fit to extend the punishment beyond the period of suspension. Hence its interest both to those who drive cars and to those who pay the drivers. Of course, the magistrates have the power—under Section IV.; but it may well prove that its exercise may prove a far worse punishment than the imposition of a fine. For the licence is often regarded as a factor in a man's character when seeking a situation, and if a few endorsements tell heavily against him the prolonged period during which he cannot obtain a renewal will wreck him altogether.

### The Harrogate Club.

ELSEWHERE we refer to the annual gathering of the Harrogate and District A.C., the members of which are able to live on terms of amity with the police authorities, while the Corporation has so far recognised their existence by encouraging local experiments with regard to the laying of dust. Although only two years of age, the organisation has now fifty members in the town. Its origin was interesting. Just prior to its inception there were rumours of the desire of certain people to secure an eight miles per hour speed limit for the town, so far as motor-cars were concerned. Dr. Ozanne drew

other hand, in addition to making good roads in the north, had obtained concessions from the Persian Government for motor-car services on them. In such sparsely-populated tracts as lay along the Nushki-Seistan route the motor speed limit need not be over moderate to ensure the public safety, while the value of the motor-car was undoubted.

THE Burlington Carriage Company, Ltd., have recently supplied a 40-h.p. Delaunay-Belleville car, with limousine body, to Sir Max Waechter, who has ordered another car, a 20-h.p. of the same make, for town use.

THE partnership hitherto existing between Messrs. Huntley Walker and Warwick Wright has been terminated, and henceforth the style of the firm will be Huntley Walker, Ltd. Mr. Victor Miller, late of the Fiat Motors, Ltd., will be the manager.

THE business of the Duryea Motor Company, Coventry, has been recently purchased by Mr. Henry Sturmeay, who is now engaged in reorganising the works and the cars. In addition to the well-known three-cylinder models, a four-cylinder car with vertical engine and cardan shaft drive is being introduced, as well as a light 8-h.p. car for the Colonial markets, working with ordinary kerosene, and fitted with either a van or two-seated body.

## THE NATIONAL CONFERENCE.

**L**AST week we referred to the importance of the deliberations of the National Conference of Motorists, convened by the Motor Union at the Hotel Great Central, Marylebone, on the 14th inst., and to the adoption of twenty-four important resolutions, not only endorsing the conclusions of the Royal Commission, but setting forth the authoritative views of the motoring community with regard to the line upon which they desire legislation to proceed. The most remarkable feature of the great convention was the unanimity with which the ideas of the Legislation Committee of the A.C.G.B.I. found acceptance. All felt that they so fully comprehended the scope of the whole matter that discussion was really unnecessary, and, while a few minor criticisms were made, the tenour of the recommendations was regarded as accurately stating the position.

Below we give the recommendations of the Royal Commission as endorsed or supported by the Conference, with the resolution of the meeting where any difference of view was presented set out in smaller type.

I. Any General Motor Car Act should deal with traction engines as well as motor-cars.

Recommendation adopted, provided all classes of traffic be regulated by one Statute.

II. The present general speed limit of 20 miles an hour for light motor-cars should be abolished, where caution is required a 12-mile speed limit may be adopted by the local authorities.

III. These 12-mile limits should be indicated in small towns and rural districts by danger signal boards, and in London and large towns by notices in the "Gazette."

(a) The recommendation for the abolition of a speed limit of twenty miles an hour welcomed, but the imposition of a fresh speed limit of twelve miles an hour regarded as illogical.

(b) No speed limit shall be imposed without the consent of the Local Government Board.

(c) The suggested method for advertising limits is most inadequate.

IV. The speed limit of heavy motor-cars weighing from two to three tons and having non-resilient tyres should be reduced to five miles an hour.

Further experience of the working of the present regulations should be obtained.

V. The duty of a motorist as to stopping when any damage or accident has occurred should be enlarged and made more explicit.

VI. The revenue derived from the taxation of motor-cars should be devoted to the improvement of roads.

A Central Department should direct the allocation of the monies raised by such taxation to the different local authorities.

VII. Some additional power and facilities should be given to local authorities for obtaining the removal of obstructions to the public view on rural highways in certain cases.

VIII. Certain suggestions should be considered with regard to the amendment of the law as to extraordinary damage by traffic on highways.

The law as to extraordinary damage by traffic on highways should be consolidated and simplified.

IX. Annual registration of motor-cars with a small yearly fee should be enforced. A registration card should always be carried on the car.

No objection offered to the annual registration of cars, providing that the fees for registration and re-registration be fixed at five shillings and one shilling respectively.

That the present right of any owner to register his car with any registering authority that he chooses be allowed to continue.

X. Identification plates, of a slightly larger size than those at present used, should be supplied by the local authority only, and should bear their mark.

This recommendation would be vexatious in operation.

XI. The registering authority should have the power of weighing any car.

The definition of the weight of a car, laden or unladen, should be amended.

The definition of weight proposed is not a practicable one, and would operate harshly against commercial vehicles.

XII. Further facilities should be arranged for enabling members of the general public to ascertain the name and address of the owner of any motor-car.

That this Conference is of opinion that any legislation of this kind should be extended so as to enable the name and address of any user of the highway to be ascertained.

XIII. Owners of motor-cars should be liable to penalty if on summary conviction they are shown to have abetted their drivers in committing certain offences connected with the driving of a motor-car, and the duties of owners as to giving information leading to the identification of their drivers should be enlarged.

No objection offered.

XIV. The procedure with regard to the issue, renewal, inspection and production of driving licences should be simplified and slightly amended.

XV. More specific regulations should be made as to the position and illumination of identification marks.

This recommendation is in many cases impracticable.

XVI. The law as to manufacturers' marks should be simplified, with a view of securing greater freedom for the motor-car industry.

XVII. The provisions of the Locomotives Act, 1898, in regard to the closing of bridges to locomotives, should be applied to heavy motor-cars.

Having regard to the very unsatisfactory condition of many of the bridges in this country, the Government be invited to appoint a Special Committee to consider the question of the bridges of the United Kingdom, and what further legislation is necessary in regard to them.

XVIII. A special penalty should be imposed for being drunk when in charge of a motor-car.

XIX. The endorsement of licences should be at the discretion of the Court, except for the more serious offences. The holder of an endorsed licence should be entitled to obtain a clean licence after two years during which he has held a licence without further endorsement.

XX. A right of appeal should lie when endorsement or a fine of over 20s. has been imposed.

There should be a right of appeal in all convictions in connection with the use or ownership of a motor-car.

XX. The emission of smoke or visible vapour on a public highway in such a quantity as to cause annoyance or danger, and the causing of excessive noise or vibration not of a momentary description, should be an offence.

That this recommendation be approved, with the substitution of "a nuisance" for "annoyance."

XXII. Two lamps should be carried on the right and left front respectively of all motor-cars other than motor-cycles.

That all legislation as to lighting should be extended to all classes of road vehicles, and should be incapable of being superseded or of being added to by any bye-law.

XXIII. The taxes upon motor-cars should be increased, and should be raised by means of a consolidated scale of duties.

That the organised motorists represented at this Conference are prepared to consider any reasonable suggestions for additional taxation, provided that the revenue so derived is devoted to the improvement of roads under the supervision of a Central Department, as recommended by the Commission (see No. VI.).

XXIV. Trade motor-cars should pay one-half the taxes charged on pleasure motor-cars.

Motor trade vehicles should be treated exactly on the same terms as those drawn by horses, and differential treatment be accorded to cars used by doctors.

The following additional resolutions were passed dealing with matters not specifically referred to in the Commission's summary of their recommendations:—

### PRODUCTION OF DRIVING LICENCES AND REGISTRATION CARDS.

That a reasonable time shall be allowed for the production of driving licences and registration cards.

### LICENSING OF PUBLIC SERVICE VEHICLES.

That the refusal of a local authority in the provinces to license motor vehicles for public services or the imposition by such authority of impracticable conditions shall be subject to an appeal to the Local Government Board.

## A THREE-WEEKS' MOTORING TOUR IN BRITTANY.

BY G. C. ASHTON-JONSON.

FOR anyone wanting a short motor holiday, Brittany is "indicated," as the doctors say. For one thing, no time is lost in getting there, for although Havre—the best port of arrival—is in Normandy, a day's run will take one to Brittany, *via* Caen, Avranches, Mont St. Michel and Dinan. The hotels are unpretentious but clean and comfortable, the roads for the most part excellent, the scenery interesting and full of variety, and the people friendly and charming. In other parts of France the scenery may be finer, and the towns more interesting, as in the Auvergne, the Pyrenees, Savoy or Provence, but it takes longer to get there. The ideal short holiday should be like ancient Gaul, divided into three parts; a week to get to some place where there is a really good hotel in delightful surroundings and a pleasant centre for short excursions, a week there, and a week for the return journey by a different route.

Such a resting-place as I describe is to be found in Quim-

perlé, in the south of Brittany. This little town is one of the most loveable places in France. Two small rivers full of trout run together there, and, forming a tidal estuary, flow into the sea seven miles away, passing through a lovely forest and by a picturesquely situated old chateau, the Abbaye de St. Meurice. The forest is called La Forêt de Clohars-Carnoët, and several roads and glades run through it, offering many attractive spots for picnics. On the coast is a dear little sandy "plage," Le Pouldu, where the shore is broken up into little sandy bays so surrounded by high rocks that each forms a more or less private bathing place, and as such they are often used. "Tre," "Pol," and "Pen" figure almost as largely in Breton place-names as they do in Cornwall, and the language shows striking affinity to Welsh; so much so that when the Welsh Bards visited St. Brieuc, in the north of Brittany, this year, it was stated that the Bretons could understand the Welsh language of the visitors. Quimperlé itself is very picturesquely situated in a valley with part of the town climbing up the steep side of a high hill, at the top of which is an interesting old church. The streets are full of old houses, and where these

overhang the rivers the views are as picturesque, though different in colouring, as at Nuremberg, on the Pegnitz. The prevailing colour of the houses is a silvery French grey, toning with exquisite effect into the green of the creepers and trees, while bright dashes of colour occur here and there from awnings or flowers in the windows.

The Hotel du Lion d'Or is itself part of an old abbey and enjoys the reputation of having been haunted at one time by the ghost of one of the abbots. The rest of the building, including the cloisters, is now occupied by the Prefecture of Police. Adjoining this fine old building is a curious circular church in the style of architecture associated with the Templars. The hotel, which is kept in a generous old-fashioned French style, is one of the most comfortable of its kind. The proprietor personally sees to the comfort of his guests, and the servants contrive to infuse into the service the same friendly anxiety for one's enjoyment of the excellent food provided as is displayed by the Dragoman on the Nile dahabeeah. The service is indeed quite a feature of this hotel, the waiting being performed by four little Breton maids, all sisters, in their very picturesque national costume and dainty caps, who by their refinement and merry talk added a distinct charm to a sojourn in this excellent hotel.

The Place National, Quimperlé, Brittany.

perlé, in the south of Brittany. This little town is one of the most loveable places in France. Two small rivers full of trout run together there, and, forming a tidal estuary, flow into the sea seven miles away, passing through a lovely forest and by a picturesquely situated old chateau, the Abbaye de St. Meurice. The forest is called La Forêt de Clohars-Carnoët, and several roads and glades run through it, offering many attractive spots for picnics. On the coast is a dear little sandy "plage," Le Pouldu, where the shore is broken up into little sandy bays so surrounded by high rocks that each forms a more or less private bathing place, and as such they are often used. "Tre," "Pol," and "Pen" figure almost as largely in Breton place-names as they do in Cornwall, and the language shows striking affinity to Welsh; so much so that when the Welsh Bards visited St. Brieuc, in the north of Brittany, this year, it was stated that the Bretons could understand the Welsh language of the visitors. Quimperlé itself is very picturesquely situated in a valley with part of the town climbing up the steep side of a high hill, at the top of which is an interesting old church. The streets are full of old houses, and where these

As a centre for short excursions—short, that is, from the motorist's point of view—Quimperlé is unrivalled. Pont-Aven, the favourite haunt of artists, is only ten miles off. From there is easily reached a peculiar little bathing place called Port Manech, where there is a *succursale* of the well-known Hotel Julia at Pont-Aven. This establishment is only one storey high and built round a small octagon-shaped courtyard with the bedroom doors all opening into it. It stands on the edge of a cliff with the waters of the Bay of Biscay round it on three sides. Lying a little back on one side is the mouth of the river Aven, and here there is a picturesque little harbour with a miniature fleet of fishing-boats and an attractive and unsophisticated little "plage." Concarneau and Douarnenez, the headquarters of the sardine fishery, are within easy motor runs, the former, with its "Ville Close," a little mediæval fortified town on an island in the harbour, being well worth a visit. Quimper, too, with its fine cathedral, should not be forgotten. Indeed, the lover of ecclesiastical architecture, Norman and Gothic, will find Brittany a mine of wealth and interest.

(To be concluded.)

## CONTINENTAL NOTES.

## The Tyre-Inflating Apparatus Competition.

As already announced, the Touring Committee of the A.C.F. will hold a competition of tyre-inflating devices during the course of the Paris Salon, commencing on December 17th. The rules provide that apparatus in which gas is compressed by other means than those provided on the automobile shall not be eligible. The jury, in making the awards, will have regard to the safety of the apparatus and its ease of adaptation and use, and the trials will be made on 880 mm. by 120 mm. tyres. Entries for the contest will be received at the A.C.F. until December 15th.

## Non-Skid Devices in Paris.

A rumour is current in Paris that the Prefecture of Police will shortly issue a regulation requiring all motor-cars in Paris to have at least one anti-skidding tyre, in order to reduce the danger to the public attendant on the skidding tendencies of automobiles, especially in bad weather.

Photo by) Touring in France—A Wayside Incident.  
(Mr. A. M. Wasnage.)

## The 1907 A.C.F. Grand Prix Race.

At the meeting of the Sporting Committee of the A.C.F. last week the general lines of the 1907 Grand Prix Race were decided upon; it is to be over a distance of 800 kilometres, to be run off in a single day. Manufacturers may each enter three cars, the entry fee up to the 1st February next being £200 per vehicle. There will be no limit to the weight of the competing machines, the race being a combination of speed and fuel consumption. It has been decided, instead of restricting competitors to the use of petrol, to allow them to choose their own fuel, the proposed allowance of 240 litres for the 800 kilometres, or 9.47 miles to the gallon, being still retained. The drivers will be at liberty to decide whether they shall take in all the fuel allowed at once, or in two or more instalments. As regards tyres, a free choice is allowed, with the condition that all four wheels of the car must be shod with tyres of one firm's manufacture. Where non-skids are employed the make of the latter will be recognised, and not that of the outer cover.

## An Example to be Followed.

The Automobile Club du Centre de la France is to be congratulated on the new departure it has just made. The headquarters of the club are in Bourges, and near the Octroi depots at the various entrances to the old town they have fixed up the following notice:—

## BOURGES—AUTOMOBILE-CLUB DU CENTRE

## TOURISTES:

Visitez:

La cathédrale  
L'hôtel de Jacques Cœur  
L'hôtel Cujas (musée)  
La rue Mirebeau  
L'hôtel Lallemant

MM. les automobilistes sont priés d'aller  
lentement dans les rues de la ville.

The idea is an excellent one and can be commended to other provincial automobile clubs.

## The 1907 International Touring Car Race in Germany.

The German International Automobile Club has issued the preliminary regulations with regard to the International race for touring cars which is to be held in the Taunus in June next, over a distance of 500 kilometres. The event will be open for cars the cylinder capacity of which is not more than eight litres; other rules are:—1. Minimum wheel base 6½ ft. 2. The minimum weight, including body and tyres, but without fuel, water, oil or spare parts, 1,175 kilogram. 3. The use of detachable rims will be allowed, and, 4. Each car must carry two persons. Firms may enter a maximum of three cars each, the entry fee up to the 31st December next being £150 per machine. Full particulars of the race can be obtained from the Kaiserliche Automobil Club, 16, Leipziger Platz, Berlin, W. 9.

## The Reliability Trials of Heavy Vehicles for Military Purposes.

The reliability trial of heavy vehicles for military purposes, organised by the A.C.F., commenced on Saturday with the weighing in of the vehicles. The competition, which will extend until December 5th, consists of a run to Marseilles and back, which will be made in sixteen daily stages of from 40 to 128 kilometres. The vehicles are divided into three classes as follows:—1, for loads from 1 to 1½ ton; 2, for loads over 1½ ton; and 3, passenger vehicles capable of carrying more than fifteen persons. Twenty-two entries were received, and of these the following nineteen started:—Three Darracq-Serpellet steamers, a Peugeot, two Cohendets, two Turgans, a D'Espine Achard, two Lacoste and Battmanns, a Janvier six-wheel lorry, a Mors, two De Dions, two Oriens, a Berliet, and a Delaugère. The first day's run, on Monday last, was from Paris to Sens, 103 kilometres, Avallon, 107 kilometres, being the destination on Tuesday.

## Miscellaneous Items.

The President of the French Republic has consented to officially open the Paris Salon on the 7th prox.—Lancia, the well-known racer, is reported to have left the Fiat Company, with the object of commencing the construction of motor-cars on his own account.—A trial of industrial motor vehicles is to be held in Brussels during the course of the Belgian Salon, from the 12th to the 27th January next.—A new monthly journal, known as "Le Poids Lourd," has just made its appearance in Paris. It deals with commercial motor-vehicles, and is the first paper of its kind in France.—The Competitions Committee of the A.C.F. is reported to be considering a project to establish a large motor racing track in the Clermont Ferrand district.—Forty-one entries have been received for the reliability trials of 1907 models, which will start in Paris on Sunday next.

THE Mayfair Motor Company, Ltd., has removed from Shaftesbury Avenue, W.C., to new premises at 22, Mortimer Street, London, W.

PORTABLE ACCUMULATORS, LTD., have amalgamated with the British Ever-Ready Electric Company, Ltd., of Emerald Street, Theobalds Road, W.C., where all motor accessories made by the former firm may be obtained.

A WANDSWORTH carriage builder has just attributed his appearance in the local bankruptcy court to the advent of the motor-car.

THE Taunton Rural District Council is circularising similar

bodies throughout the country with a view to arousing their opposition to the proposal to nationalise the roads and abolish the speed limit.

MESSRS. NEILSON BROS. have a conveniently arranged garage at Kirkcaldy.

MESSRS. HILL AND BROWN have opened a garage at the Harbour Engineering Works, Perth.

MR. A. R. GARNETT has removed from Shaftesbury Avenue, W.C., to new premises at 181, Piccadilly, W.

MESSRS. WEST, LTD., are opening a depot at 85, Shaftesbury Avenue, London, W.C., for the sale of West cars.

£504 has been handed to Blackpool charities as a result of the recent races organised there by the Blackpool and Fylde A.C.

FRIDAY of next week will be the last day for receiving entries for the Commercial Vehicle trials of the A.C.G.B.I., which take place in February or March of next year.

THE Highways Protection League has met with a rebuff from the Llandaff District Council, which has described its programme as "full of fads," and ordered it to lie on the table.

THE L.C.C., at their meeting on Tuesday, accepted a suggestion made by Sir J. W. Bonn, M.P., that the Highways Committee report upon the general effect of the motor-omnibuses upon the traffic of London.

We learn that Mr. J. Sydney Arter has joined the Heron Motor Company, Birmingham, and that the business will in future be carried on as a private limited company under the joint management of Messrs. J. J. Horne and J. S. Arter.

MR. CATHCART WASON resumed his Parliamentary questioning on Monday, when he was informed by Mr. Gladstone that in the case of motor prosecutions it was in no case necessary for the police to prove the exact speed at which a car was travelling.

The 20-25-h.p. Brotherhood Car recently built to the order of Miss Hawker, of Plymouth.

As illustrating the extreme simplicity of control it may be mentioned that Miss Hawker's vehicle is being attended to and driven by her coachman, who until a few weeks ago had had absolutely no experience with a motor-car.

AMONG the novelties at Olympia, according to some of the daily newspapers, is the "White-Siddley car for the Queen."

THE Sirdar Rubber Company, Ltd., have received another repeat order from the War Office for Royal Sirdar buffer tyres.

A SET of the "De Fornier-Mayer" tyre protectors is in course of construction for use on the steam fire engine of the London Fire Brigade.

MR. WARWICK WRIGHT has, we learn, joined the firm of Messrs. Ernest Arnott and Holloway, Ltd., taking with him the concession for the four-cylinder Minerva cars.

IN connection with the ten years' anniversary of motoring, Messrs. Jarrott and Letts have issued an interesting booklet, containing a short history of the Dietrich firm.

MR. PETER REID'S garage in Prince's Street, Perth, is on the main road to Edinburgh, and is well equipped for the supply of accessories to motorists passing through the Fair City.

THE resolution passed by the A.C.G.B.I. last year, relating to the publication of speeds made at hill climbs, &c., has being rescinded, there being now no necessity to withhold these from the public.

MESSRS. JARROTT AND LETTS, LTD., inform us that in an agreement recently entered into by them with Messrs. Crossley Bros., Ltd., they have been appointed sole representatives for the whole of the output of Crossley cars.

MR. A. ROBERTS, of the "Roberts" Non-Skid Motor Tyre Tread Manufacturing Company, Gripwell Works, Birmingham, has an improved tyre gauge which has satisfied many of the motorists who have seen it at the Charterhouse Hotel, Charterhouse Square, E.C., during the week.

MESSRS. BOULT, TAYLOR AND CO., LTD., who have acquired the agency for the Nacke pleasure and commercial vehicles, made by Messrs. E. Nacke, of Coswig, Saxony, have just opened a depot at 12, Upper St. Martin's Lane, London, W.C., where free garage is now available and a large stock of accessories is kept.

ON Tuesday last the Enfield Autocar Company, Ltd., entertained its agents and friends to dinner at Frascati's Restaurant, London, W. Mr. Albert Fadie presided, and a most pleasant evening was spent. From the enthusiasm shown it is evident that the new Enfield car, under the guidance of Mr. E. H. Lancaster, will soon be one of the most popular in the country.

The 16-h.p. Turner-Miesse Landaulet built for Alderman G. T. Brown, J.P., of Chorley, Lancs. The vehicle is the first of the kind turned out by Turner's Motor Manufacturing Company, Ltd., and its owner is extremely pleased with its running.

DURING the past week the chassis of the new 40-h.p. Weigel car has been on view at the Hotel Great Central, Marylebone Road, N.W., where on Monday Weigel Motors, Ltd., entertained a number of their agents and friends to lunch. The new vehicle, of which some particulars have already been given in the M.C.J., attracted considerable notice, while the display of component parts, which formed part of the luncheon table decorations, show that no pains have been spared to turn out a car of the highest grade.

SIR PHILIP WATERLOW, Bart., has ordered a 28-h.p. Daimler chassis with 10½ ft. wheelbase.

THE Pembroke Motor Garage and Works has been opened in the Portsmouth Road, Thames Ditton, by Mr. R. Whitehead.

AN educational visit to the Clement-Talbot works in Ladbroke Grove was recently enjoyed by the students of the motor-car classes at the Regent Street (London) Polytechnic.

MR. J. KEYS, who has catered for the wants of motorists at the George Hotel, Buckden, has removed to the Turk's Head Hotel, Newport, Lincoln, where he will continue to give them special attention.

EXTENSIVE use is being made of motor-lorries by the Midland Railway in connection with the working of goods traffic in North Wilts. Goods depots have been established at Bradford-on-Avon and at Trowbridge.

MESSRS. RENNIE AND PROSSER, Ltd., of Glasgow, have issued an attractive booklet entitled, "What Panhard owners say?" and consisting of testimonials from those residents of the northern territory to whom they have sold these cars.

THE capital of the Motor Union Insurance Company, Ltd., having been largely over-subscribed, the directors went to allotment on Monday. There was a large number of applications for small allotments coming from all parts of the country.

MR. J. A. RYLEY, of 23½, Martineau Street, Birmingham, is very busy with "Vita" plugs, "Eclair" coils, and the "Amac" motor specialities. With regard to the "Eclair" coils he has not known, for the past three years, a single case of breakdown.

The Maudslayi 20-30-h.p. Extended Landulet.

A NEW glass screen arranged to be attached above the dashboard of a motor-car has just been brought out by Mr. A. Rivett, of High Road, Leytonstone, its feature being that it can be raised or lowered to any position, even while the car is in motion.

WE learn that Messrs. Gauthier and Co. have secured the British agency for the Sizaire-Naudin car, which took the first place in the recent reliability trial for voiturettes in France. A new 11-h.p. model is being introduced, for which Messrs. Gauthier are open to arrange for agencies throughout the country.

MESSRS. JAMES AND BROWNE, LTD., inform us that they have come to an agreement with the Lacre Motor Car Company by which the latter firm takes the whole of the output of J. and B. cars, both of the pleasure and business type, during the next ten years. All inquiries with reference to the "J. and B." vehicles, either of the horizontal or vertical engine type, should therefore be made direct to the Lacre Company.

THE "Vultrye" vulcaniser, which is being placed on the market by the Motor Patents, Ltd., 110, Cannon Street, E.C., is a simple apparatus which is screwed to the bench or table with the box part projecting in such a position as to hold the tyre under repair. The tube surrounding the puncture is cleaned, the special solution spread over the cleaned surface; the prepared patch, which in itself contains the vulcanising chemicals, is then placed over the puncture, and the iron block is heated and placed in position. In fifteen minutes the repair is made, being an amalgamation with the original tube. Doubtless motorists generally will be interested in the new device.

MR. D. B. WRIGHT has opened the Botanic Gardens Garage and Repair Works, in Vinicombe Street, Glasgow.

THE gift of a steam roller to the Highway Board of the Isle of Man by the A.C.G.B.I. may be regarded as a token of appreciation of past favour, as well as a hope of further consideration in the future.

MESSRS. MOORE AND SPIERS, of 1, Fenchurch Street, E.C., have obtained the use of several private tracks at Alexandra Park, Bexhill, Bristol, Rochdale, &c., for their forthcoming motor-car auctions.

MESSRS. J. W. BROOKE AND CO., LTD., Lowestoft, inform us that in future they will confine their attention entirely to six-cylinder cars, and that the whole output for a term of years has been purchased by a London Syndicate.

AT Plymouth, the Plymouth Engineering and Automobile Company, Ltd., have established theoretical and practical classes for motor tuition, commencing with fifty pupils, including thirty non-commissioned officers and men from the local barracks.

MR. C. H. CORBETT, M.P., acknowledging the receipt of a resolution of the Cuckfield Rural District Council with regard to the speed limit, disagreed with their views. He regarded this legal restriction of speed as quite unnecessary and impossible of enforcement.

SIR STANLEY AND LADY BOIS and party have been touring in the north of Ceylon on a 12-16-h.p. Horbick and a 7-h.p. Peugeot car. The roads were found to be in good order, and the possibilities of motor touring in the island were fully demonstrated.

"It is unfortunate," says the "Local Government Officer," "that the fate of our roads arouses little interest in Parliament," and, continues our contemporary, "we rather think the solution will be found in a Central Highway Board responsible for all main roads." That is the view to which all authorities are coming.

THE City Motor Garage and Motor Manufacturing Company, of Millsands, Sheffield, have a well-equipped garage, and, in addition to manufacturing the "Paragon" mud and dust collector, are making a feature of their patent pneumatic collapsible motor tyres, the prices of which have lately been reduced.

IN place of their old premises in Long Acre, W.C., which were destroyed by fire, Messrs. Ducros Mercedes, Ltd., have had erected a new and commodious block on the same site which ranks amongst the finest motor-car showrooms and premises in the country, possessing the advantage of being built for the purposes to which they are applied.

THE Liverpool Motor House, Ltd., whose garage has hitherto been in Atherton Street, Liverpool, have found it necessary to remove to larger and more suitable premises. Their new establishment is to be in Peter's Lane. The repair department is under the control of Mr. P. F. Rigden, and the general management is in the hands of Mr. John Wilson.

MESSRS. ALFRED RUSSELL AND CO., of Walsall, have issued a new list of their automobile lamps which should do much to extend a knowledge of their high-class specialities for motor-cars. The "Russell" self-contained headlights are now fitted with a patent concealed pivoted handle or carrier. This is instantly available for use when required, while when in the normal position there is no disfiguration of the contour and appearance of the lamp. The condensing lens is easily detachable for cleaning purposes, and the whole arrangement of the headlights is most simple, the lamp being equally satisfactory in its range of light. These headlights are self-contained, or can be had fitted with separate generator. The "Russell Sunlight" sidelight is another new model of the firm's production, which, if desired, can be fitted for electricity in addition to petroleum, the patent ventilating tube in the petroleum lamps providing a satisfactory method of conversion to and from an electric lamp. Messrs. A. Russell and Co.'s facilities of manufacture enable them to make a wide range of designs, and the high grade material employed is a security for the durability as well as the permanent good appearance of the lamps.

# The Olympia Motor-Car Show.

(Continued from page 823.)

General View of the Show.

## SOME TENDENCIES IN DESIGN.

**B**EFORE continuing our review of the exhibits at the Olympia Show, it may be of interest to briefly survey the general tendencies of the design of motor-cars, as exemplified in the cars that are now on view. The one great outstanding characteristic of the Exhibition is, of course, the rapid increase that has taken place in the number of six-cylinder cars. While there are still many who hold the opinion that four cylinders give all the advantages of the "six," with less complication, two firms at least—Napier and Brooke—have such confidence in the latter that they have resolved to entirely confine their attention in the 1907 season to six-cylinder vehicles. Another noteworthy and satisfactory feature is the steady growth in the number of British motor-car firms and the marked improvement in the vehicles being turned out in this country. By far the majority of the cars on view are of the petrol type, steam and electricity being represented by only two firms in each category. No radical change in the design of petrol motors is discernible, although we have been favoured with an opportunity of examining at the Show the drawings of a somewhat revolutionary type, in which, while working on the usual four cycle system, the employment of inlet and exhaust valves operated by cams, tappets, and springs, is entirely obviated. For the moment we are not at liberty to say anything of the new engine, but may add that one has already been constructed, and is said to be giving every satisfaction to its designer. The horizontal engine, although abandoned by the Wolseley Company, is still *en evidence*, and, in fact, would appear to be on the increase, they being shown by the New Engine Company, the Pilgrim's Way Motor Company, the Adams Manufacturing Company, Messrs. James and Browne, and the Anglo-American Motor Car Company. The principal practice is to cast the cylinders in pairs, although this is not universal, as some makers adhere to separately-cast cylinders, while, in one case, a six-cylinder engine is in two castings, and in three or four others the four cylinders are made in one block. Mechanically-operated inlet valves are now practically universal,

although whether it is better to place them side by side with the exhaust or to operate them off a separate cam shaft is still an open question with designers. As regards what may be termed engine subsidiaries, such as the water circulating pump and magneto, these are for the most part gear-driven and mounted directly on the motor. The design of carburettors with the view of rendering them automatic in action still affords engineers ample scope to display their ingenuity. In the case of ignition there is a tendency to fit two systems—accumulators and magneto—and it would seem, as regards the latter, that the high-tension type is gaining in popularity over the earlier low-tension magneto with make-and-break mechanism. The employment of an automatic governor is decreasing, foot and hand control of the engine being now largely relied upon, although there are a number of cars in which the clutch is so connected up with the throttle that as the former is withdrawn the speed of the motor is cut down. The fitting of metal shields below the engine and gear-box to protect the latter from dust and dirt is becoming more and more general, while with the object of rendering the 1907 petrol car even quieter than its 1906 prototype, several firms, in addition to using more efficient silencers, are now enclosing the valve stems and springs so as to deaden the slight noise made by the valve tappets as they strike the stems. The agitation against the emission of obnoxious smoke, owing to over-lubrication, has apparently caused motor engineers to devote special attention to this part of the automobile, the result being quite a number of ingenious and interesting mechanical lubricating devices. Clutches continue to show wide variety, and although the multiple disc and metal-to-metal type are growing in popularity, the leather-faced cone clutch is still far from being discarded. Ball bearings are being more generally adopted, while, prospects of patent litigation notwithstanding, the "gate" system of controlling the change-speed gear is quickly becoming universal. Direct drive on top speed is the more general practice, but a few instances are seen where the third speed is direct, the fourth being an indirect drive. As regards transmission, the tendency is still in favor of the cardan shaft and live axle for cars up to 30-h.p.,

while above that power the side chain drive is still the most popular. In connection with the latter it is satisfactory to find that more attention is being paid to the protection of the driving chains in the case of the chain-driven vehicles, the Sunbeam, Albion, and C. G. V. cars all being provided with gear cases. As regards the design of the cardan shaft and live axles there can be no question that considerable improvement has been effected. Manufacturers have recognised the weak points of this type of transmission, and, by dint of much thought, have evolved a combination which should give excellent results in practice. More attention is being paid to the suspension of the chassis, with the view of reducing the road shocks to the passengers; and not only are shock absorbers being freely employed, but a transverse spring at the rear supplements the usual four longitudinal ones in many cars. Looking at the vehicles from the body point of view, the tendency towards covered carriages continues a marked feature, and there can be no doubt that coachbuilders are now putting considerable energy into their department of automobile construction.

In concluding this necessarily cursory review we may draw attention to a feature which will no doubt result in a large addition to the ranks of automobilists. We refer to the reduction in prices which has been announced by many concerns. Although this is more noticeable in the high-powered cars than in those of more limited engine capacity, motorists of moderate means will find that their requirements have not by any means been overlooked.

#### The West Cars.

A new model of the West cars is seen at the stand of WEST, LTD., in a 20-22-h.p. chassis. The engine is one of the latest types of Astors, and is fitted with both high-tension magneto and accumulator ignition. The mixture is furnished by a White and Poppe automatic carburettor, in which the petrol supply is regulated in conjunction with the air. The clutch, of which we hope to give an illustration in a later issue, is of a new metal-to-metal expanding type, consisting of two shoes operated by two special cams, the latter having six inclined faces. A joint is provided between the clutch and the gear-box to allow for any want of alignment between the two parts. Three speeds and a reverse are provided, with direct drive on top speed, the power being transmitted through a cardan shaft to a live axle. The cardan shaft, which has a combined universal and telescopic joint at its forward end, is enclosed in a sleeve, which is mounted on ball bearings. The axle has only the driving strain to withstand, the power being imparted to the road wheels through dog clutches in the hubs. Ball bearings are used throughout, except on the engine, while the chassis in all the cars are

Fig. 13.—Chassis of the West 20-22-h.p. Car.

supported on five springs. For the 1907 season three sizes are being made—15-h.p., 16-20-h.p., and 20-22-h.p.—the exhibit comprising a 15-h.p. touring car to seat five and a 20-22-h.p. landaulet, both of which in view of their moderate price and sound construction, are worthy of notice. On the stand is also shown the 14-h.p. Academy car, built by Messrs. West, Ltd., for the Motor Academy, and which took part in the Tourist Trophy race.

#### The Mercedes Cars.

One of the finest stands in the Show is that of Messrs. DUCROS-MERCEDES, LTD., where are staged one of the 35-h.p. 1907 Mercedes chassis; a 35-h.p. car, with Roi des Belges body, painted and upholstered dark red, and fitted with double extension Cape cart hood, and folding wind screen; a 45-h.p. Mercedes, with limousine body, to seat in all seven persons; a 20-25-h.p. landaulet, painted and upholstered

Fig. 14.—View of Carburettor Side of new Mercedes 35-h.p. Motor.

in dark blue; and a 35-h.p. Roi des Belges double phaeton, with detachable closed-in top. The 35-h.p. and 45-h.p. are new models, the cylinder dimensions of the former being 110 mm. by 140 mm., and of the latter 45-h.p., 120 mm. by 150 mm. The carburettor is quite a new design, and in the absence of illustrations can only be briefly referred to. The air supply is admitted and controlled automatically instead of mechanically, and an adjustable needle in the jet is provided for regulating the supply of petrol, and so more effective carburation, in that it tends to spray the spirit instead of sending a solid jet from a plain opening. No hot air inlet is fitted, the mixing chamber being, instead, provided with a hot water jacket. The throttle valve, which is independent of the automatic parts which tend to maintain a constant richness of mixture, or which are adjustable to suit atmospheric conditions, is coupled up to the governor, which latter is in turn controlled by an accelerator pedal and a lever on the steering-wheel. The engine, gear-box, clutch, and brakes are the same as last year, but an improved lubricator has been adopted. The latter is operated by an eccentric off one of the cam shafts, a separate pump forcing the oil down each of the eight sight feeds, a hand pump, by which a charge of oil can be given to the engine at any time, being also provided. A pedal for operating a cut-out on the exhaust pipe is also provided, as well as a switch on the dashboard, by means of which the magneto can be short-circuited, the cut-off valve for the petrol being thus dispensed with. The hand pump for obtaining the necessary air pressure for the petrol supply is no longer on the dashboard, but is placed horizontally between the floor-boards, the handle alone projecting out on the near side. The mud-protecting shield below the engine and gear-box is provided with louvre openings, as is also the engine bonnet. The openings are arranged that while no dust can find its way in, the rush of air may assist the fans in cooling the heated atmosphere inside the casing. More effective cooling has been aimed at, a belt-driven fan being now fitted behind the radiator, in addition to the flywheel fan. The Mercedes Company are also building a 70-h.p. six-cylinder model, but none of these are yet to be seen in this country.

#### The Brouhot Cars.

Three sizes of the Brouhot chain-driven cars are shown by the BROUHOT COMPANY OF GREAT BRITAIN, LTD., 12-16-h.p., 16-20-h.p., and 24-30-h.p. The 12-16-h.p. is a new model, the four-cylinder engine having the valves located on opposite sides of the cylinders, while on the others they are operated off a single cam shaft. By means of a lever placed on the dashboard, the lift of the inlet valves can be varied. The crank chamber is divided into compartments, so that each cylinder is efficiently lubricated. The carburettor, which is provided with a hot-water jacket, is of the automatic type, while the ignition is by low tension magneto. The smaller car has three forward speeds, while the larger ones have four; in all the control is by a single lever working in a "gate." The lubrication of the motor is controlled by a pump, which forces the oil from the tank through a sight-feed lubricator on the dashboard. The control is by two sectors on the steering wheel, one actuating the ignition and the other the quantity of mixture allowed to pass to the cylinders. A feature of the Brouhot cars is the accessibility of such parts as the contact maker, clutch, &c. Any type of body can be fitted to the chassis, the

complete cars on view, including a luxuriously finished 24-30-h.p. landaulet.

#### The Vinot Cars.

The new Vinot 35-50-h.p. six-cylinder model naturally attracts considerable attention to the stand of Messrs. T. J. HARMAN AND Co. The cylinders, which are cast in pairs, are 103 mm. bore by 130 mm. stroke; the valves are mechanically-actuated, and are located on opposite sides. The ignition is by high tension magneto, and the mixture furnished by

#### The De Dietrich Cars.

Prominent on the stand of Messrs. JARROTT AND LETTS, LTD., is a chassis of the latest type of 40-h.p. De Dietrich car, in which a number of changes and improvements have been made. The four cylinders, which are cast in two pairs, are 130 mm. bore by 160 mm. stroke. The valves are all located on one side, and operated off a single cam shaft. The mixture is furnished by an automatic carburettor, with hot water jacket, specially designed to secure economical and silent running.

Fig. 15—The Vinot Six Cylinder Engine.

a Krebs automatic carburettor. A very neat arrangement of the admission pipes has been adopted, in order that each cylinder shall receive a full charge at each suction stroke of the motor. The engine is controlled by hand and foot levers, no automatic governor being fitted. The water circulating pump is fitted with a spring drive. The engine and gear-box are carried on a sub-frame, suspended from the main one, which is of pressed steel construction. The clutch is of the disc type, and the change-speed gear is actuated by a lever working in a vertical "gate" on the Vinot special system, the arrangement, however, having been improved. Four speeds forward and a reverse are provided, with direct drive on top speed to the differential shaft, and thence by side chains to the rear road wheels. The rear springs are of the three-quarter elliptical type, and the wheel-base is 10 ft. 4 in. The lubrication and brake system have all been carefully thought out,

The lubrication of the engine is automatically effected, a novel feature being the gauge and tap fitted in the crank case, which enables the oil level to be seen without it being necessary to open up the inspection doors. The ignition is by low tension magneto, the ignition plates being now placed at the side of the cylinders, instead of on top, as hitherto. To facilitate the starting of the engine, a special half-compression device, operated from the front of the car, is provided. The clutch, which is of the metal-to-metal expanding type, is connected by a universally-jointed shaft to the gear-box. The latter is adapted to give four speeds forward and a reverse, all being controlled by a single lever working in a special "gate" quadrant. The usual side chain transmission is retained, and ball bearings are fitted to all parts except the engine. For the 1907 season four sizes of De Dietrich car will be built—16-h.p., 24-h.p., 40-h.p. and 60-h.p.—all having four-cylinder engines and side chain transmission.

Fig. 16.—Chassis of 40-h.p. De Dietrich Car.

so that the new car should enjoy as excellent reputation as the Vinot four-cylinder vehicles, two examples of which—a 16-24-h.p. and a 24-32-h.p.—are on view. The first named is fitted with a handsome double phaeton, with hood and front glass to the rear seats. The cylinders are 95 by 130 mm., and the ignition by high tension magneto, the timing of which is fixed, so that the engine is controlled by a single lever. The clutch is of the Vinot self-centring leather-faced cone type. The 24-32-h.p. vehicle, which is on similar lines to the 16-24-h.p., is fitted with a double landaulet body, and is well designed for use as a town carriage.

The complete cars on view include a 16-h.p. landaulet by Kellners, of Paris. It is finished in green, with black mouldings and leather upholstery to match, and is a splendid example of a carriage for town work; and a 24-h.p. limousine body, also by Kellners. The latter is designed for town or country use, and has a striking appearance; in fact, it is one of the most highly-finished vehicles in the Show. Finally, reference must not be omitted to the 130-h.p. De Dietrich racing car on which Duray finished first in the Circuit des Ardennes, covering a distance of 375 miles in 5 hours 38 minutes, thus averaging 66½ miles an hour.

**The Humber Cars.**

Great as was the interest taken in the HUMBER exhibit last year, it is altogether eclipsed by the attention paid to the present display. Five cars are on view, two made at the firm's Beeston works and three at the Coventry factory. The two Beeston cars are fitted with

Fig. 17.—The 30-h.p. Beeston-Humber Car.

a new engine, which is much more powerful than that of last season, and is rated at 30-h.p. Considerable improvements have been made in the car; in particular, the back seats have been widened so that three passengers can be conveniently accommodated on same; a new transverse spring is placed at the back. The back axle has been re-designed. The road wheels run on ball bearings of large diameter, and ball thrust bearings taking the side thrust to the road wheels, mounted on the axle sleeve; there are thus no side strains on the shaft or differential. The driving shaft and the bevel pinion are also mounted on ball bearings, and ball thrust bearings are fitted on either side of the bevel wheel and behind the pinion. The front axle has also been re-designed, and is of H section steel instead of tubular as in the past. The engine comprises four separate cylinders, 110 mm. bore by 130 stroke, the normal speed being 900 revolutions per minute. Two systems of high tension ignition, magneto and accumulators, are provided. The clutch is of the leather-faced cone type, and the gear-box is adapted to give four speeds forward and a reverse, with direct drive on the fourth. The gear is designed so that the changes from one speed to another can be made without meshing the intermediate gear wheels. For example, a change can be made from the top to the lowest speed without interfering with either the second or third speed gear wheels. Both shafts run on ball bearings; the main shaft being fitted with an auxiliary bearing to prevent torsion.

Fig. 18.—The 10-12-h.p. Coventry Humber Landulet.

double-acting, internally-expanding, metal-to-metal brake on the driving shaft is operated by a pedal, while a side lever brings into action brakes of similar construction acting within drums connected with the rear road wheels. One of the two cars is provided with the standard type of body, and the other a landulet to seat five passengers in addition to the driver. The Coventry cars include the well-known

10-12-h.p. vehicle, with tubular frame, on which, amongst various other improvements, appear the following: wider springs, fitted with anti-shock leaves; wider track, giving greater lock, thus enabling the car to be turned in a much smaller radius; steering heads fitted with ball bearings; front wheels on cage ball bearings as on the rear wheels, and improved steering. A handy little two-seater, specially built on the 10-12-h.p. chassis for the use of medical men, is also now being turned out. It is fitted with wind-screen and hood. In addition to this, a new model, closely resembling the above 10-12-h.p. car, but having a 15-h.p. engine, a pressed steel brake, and improved body, has been introduced. The cylinder dimensions are  $3\frac{1}{2}$  in. bore by  $4\frac{1}{2}$  in. stroke. Three speeds and a reverse are provided, and the transmission is by a cardan shaft to a live back axle. The latter is of a new design, radius rods having been discarded, the thrust being now taken by the frame springs. The road wheels are mounted on the outer sleeve, and run on ball bearings, the power being imparted to the wheels by means of cross-shaped pieces fixed to the ends of the live axle, meshing with slots in the end of the hubs. The Humber cars are among the most popular of British-built vehicles, and it is evident from an inspection of the models on view that no pains are being spared to maintain the position they have so rapidly gained.

**The Delaunay-Belleville Cars.**

A very imposing display of the Delaunay-Belleville cars is made by the BURLINGTON CARRIAGE COMPANY, LTD., the exhibit comprising a 40-h.p. highly-finished chassis, a 40-h.p. limousine, with Burlington cerise exterior, and colours harmonising on the under-carriage and wheels; a 28-h.p. limousine, with green exterior and under-carriage; a 28-h.p. detachable limousine, the special point of the body being the absolute uniformity of appearance when the top is removed; a 20-h.p.

Fig. 19.—The 40-h.p. Delaunay-Belleville Car supplied by the Burlington Carriage Company, Ltd., to Lieut. Eyres Monsell, R.N. —

The vehicle is fitted with a Burlington touring body, the special features of which are the total absence of overhang the rear seats being well inside back wheels; the ample side entrance and neat shaping of doors; the Cape hood, which is fitted with side curtains, windscreen, &c.; the large size of rear tyres, 935 mm. by 135 mm.; and the ample room for luggage; a surface of 4 ft. by 5 ft. is available on the carrier at the rear, and, in addition to this, a large quantity of luggage can be attached to the side platforms, which are of extra width.

double landulet, specially constructed for town, touring, and general work; a 20-h.p. single landulet, fitted to a cardan shaft driven chassis; a 20-h.p. detachable top landulet—this is an especially noteworthy vehicle, as the landulet has the appearance essential to a town car, and, when the top is removed, is not distinguishable from a Roi des Belges open touring car; a 20-h.p. Roi des Belges seven-seater car, fully equipped for extended touring; and a 20-h.p. double landulet, with interior "de luxe" in drab. As regards the mechanical details, the 1907 models differ but slightly from those of the current year, a point which, in conjunction with the fact that the design is practically the same as the original of three years ago, is particularly noteworthy as illustrating the high degree of efficiency and reliability that has been achieved. The bore of the cylinders is somewhat larger than in the 1906 models, so that the power is greatly increased; the same gearing ratio is, however, used, the result being that the 1907 Delaunay-Belleville is to all intents and purposes a "top-speed" car. An additional air-inducing fan is incorporated in the flywheel, and extra louvres are formed in the casing under the chassis. The main oil tank, which supplies the base chamber, has been enlarged to double the former size, so that the refilling process is not of such frequent occurrence. The engine lubricating system is one of the special

features of these cars, and one which has contributed in no small measure to their success. To sum up briefly, the Delaunay-Belleville chassis rank among the leading types of the present day, the body-work, as fitted by the Burlington Company, being of an equally high order, the combination resulting in a vehicle which is rapidly becoming a favourite in Society motoring circles.

#### The Brasier Cars.

For the 1907 season Messrs. MANN AND OVERTON'S, LTD., inform us that the Brasier cars will be made in two sizes—18-26-h.p. and 28-42-h.p.—both having side-chain transmission. An example of the larger type is on view, and an inspection of it reveals the fact that this well-known make of car is likely to fully maintain its high reputation. A sub-frame of tubular construction is still employed to carry the engine and gear-box; the main frame is now narrowed in front to increase the lock of the steering-wheels. The four cylinders are cast in pairs, with the valves all arranged on one side; the dimensions of the 18-26-h.p. engine are 90 mm. bore by 120 mm. stroke, and of the 28-42-h.p., 112 mm. by 130 mm. The crank shaft is *desaxé*, that is to say, it is slightly out of line with the centre of the cylinders. Ignition is by low tension magneto, the operating shaft being located overhead with the strikers so arranged that each may be taken out independently of the others. The 28-42-h.p. car is fitted with a half-compression

"gate." Four hand brakes comprise the braking system. Two of these operate on steel drums on the differential shaft, one on each side of the differential. The other two are on drums attached to the hubs of the rear wheels, all being of the internal expanding variety. Ball bearings are used throughout, except on the engine. Mr. Burgess informs us that the Miesusset Company also build 7-9-h.p. two-cylinder, and 12-16-h.p. and 30-40-h.p. four-cylinder cars.

#### The Hotchkiss Cars.

For the 1907 season three sizes of Hotchkiss cars—20-30-h.p., 25-35-h.p., and 35-45-h.p.—are being turned out. The two former have four cylinders, and the latter six, and it is the chassis of this type which attracts most attention at the stand of the LONDON AND PARISIAN MOTOR COMPANY, LTD., the British agents. It is undoubtedly a fine piece of work, and well repays any time spent on its inspection. The pressed steel frame is raised at the rear to give clearance for the differential case, and narrowed at the front to give a wide lock to the steering wheel. The cylinders, which are cast in three pairs and have valves arranged on opposite sides, are 120 mm. bore by 120 mm. stroke. The crankshaft, as is usual in Hotchkiss cars, is mounted on ball bearings. Ignition is by gear-driven Eisemann high tension magneto. Special attention has been devoted to the question of engine lubrication, which is effected by an improved form of lubricator mounted on the dashboard.

Fig. 20.—The Brasier 18-26-h.p. Landaulet.

device, operated from the front to facilitate starting of the engine. A new horizontal carburettor, with automatic supplementary air inlet, has been adopted, which, it is claimed, gives more power, greater flexibility, and increased economy of fuel. On the 18-26-h.p. model thermo-siphon water circulation is employed; the large model, however, has a centrifugal pump, and a radiator similar to those used on this year's racers. The leather-faced cone type of clutch is retained, a double-jointed shaft connecting it with the gear-box. The latter is adapted to give four speeds forward and a reverse, with single operating lever working in a "gate." On the top speed the drive is direct to the differential shaft. The steering-gear has been strengthened, and the steering column increased in diameter. Ball bearings are fitted to all parts except the engine. Each car is made in two lengths of chassis, so that any type of body may be fitted.

#### The Miesusset Car.

Quite a number of high-grade types of cars are now being built in Lyons, among which is the Miesusset, for which Mr. W. H. M. BURGESS has secured the British agency, and who is exhibiting a chassis of the 20-24-h.p. model. The vehicle follows the usual lines of chain-driven machines. The cylinders, which are cast in pairs, are 105 mm. bore by 130 mm. stroke, the valves being arranged on opposite sides. Dual ignition is provided, while the throttle on the automatic carburettor is controlled by both foot and hand levers. The clutch is of the leather-faced cone type, and the change-speed gear, giving four speeds forward and a reverse, is operated by a lever working in a

The admission piping is arranged in such a way that an equal distribution of gas to the six cylinders is obtained. The Hotchkiss distinctive type of honeycomb radiator with triangular tubes is retained. The clutch, which is of the leather-faced cone type, is mounted on an extension of the crankshaft. The gear-box, which is supported on cross members immediately behind the clutch, and is smaller in size than formerly, gives four speeds forward and a reverse, with direct drive on the high gear. The control is by a single lever working in a "gate" quadrant. From the gear-box the power is conveyed through a cardan shaft and bevel gear on to a live axle, the design being the result of several years' experience with this type of transmission. A chassis of the 25-35-h.p. Hotchkiss car is also on view; this possesses all the features of the "six," from which it differs only in the number of cylinders. The 20-30-h.p. model is represented by a three-quarter landaulet, an excellent example of the high-class bodies which are being fitted to the Hotchkiss cars.

#### The Rover Cars.

Six cars are shown by the ROVER COMPANY, LTD., ranging from 6 to 16-20-h.p. Generally speaking the 6-h.p. car follows the lines of the 1906 pattern, but is improved in many details, the most noticeable of which is the tulip-shaped body and upholstery. A side lever brake is now fitted to the 8-h.p. cars, two of which, equipped with four-seated bodies, are on view. The 16-20-h.p. are now provided with worm and segment steering, whilst the brakes have been much improved.

**The Daimler Cars.**

For the 1907 season the DAIMLER MOTOR CO., LTD., are again building four sizes of four-cylinder cars, 28-h.p., 30-h.p., 35-h.p., and 45-h.p., the first three being made in three lengths of chassis, and the latter in two lengths. With the exception of the 45-h.p. engine, which is a single casting, the four-cylinders are cast in two pairs, the bore and stroke of the different sizes being as follows:—28-h.p., 120 mm. by 150 mm.; 30-h.p., 130 mm. by 150 mm.; 35-h.p., 140 mm. by 150 mm.; and the 45-h.p., 150 mm. by 150 mm. The ignition is by accumulators and coil, provision being, however, made so that a magnet cap, if

Fig. 21.—The Daimler 30 h.p. Limousine.

desired, be added with a minimum of trouble. A new feature is the position in which the plugs are placed; formerly they were carried above the valves, but they are now fixed into the water-cooled portion of the cylinders, and consequently troubles with breakages and electric "shorts" should be practically overcome. The throttle and ignition are controlled by a single lever on the steering wheel. The radiator, while of the same pattern as last year, is considerably larger, the circulating pump being also of greater capacity. Looking over the chassis generally, we note that the frame is now constructed of pressed steel with strong tubular cross members. It has been considerably lowered, thereby facilitating entrance to and exit from the carriage body; the engine itself has, however, been raised in the frame, so giving greater road clearance. A flexible joint has been introduced on the driving shaft at the rear of the clutch sleeve, in addition to the front of the gear case, so that any tendency of the clutch to get out of alignment, even on the roughest roads, is prevented. The clutch itself now slides to and fro on the end of the crank shaft, which has been prolonged in the rear of the fly-wheel. This arrangement secures the permanent and automatic alignment of the clutch, and in this connection it may be noted that the clutch pedal tension has been considerably reduced, rendering much less effort necessary to declutch on the part of the driver. The relative positions of the driving shaft and differential countershaft have been reversed: the latter is now placed below the frame. It is suspended by brackets, and the sprocket pinions at each extremity are thereby brought level with the road wheel centres. This arrangement not only secures great mechanical efficiency, but also permits of the attachment of a much more commodious side entrance body. The well-known Daimler design of gear-box is retained. Both

Fig. 22.—View of Portion of Daimler 1907 Chassis, showing Clutch Shaft with two Universal Joints marked X.

the width and diameter of the brake drums have been increased, resulting in an increased "life" and a sweeter and easier action. Considerable care has been devoted to the question of springing with a view of securing the maximum of comfort. The 9½ ft. wheelbase chassis is fitted with a transverse rear spring, which has been found to greatly improve the smoothness of running, in addition to minimising the "throw" of short wheelbase cars on rough roads. In the case of the 10½ ft. and 11½ ft. wheelbase chassis, it has been found advisable to attach very long side springs only. Special attention has been devoted to the question of producing a car which shall raise a little dust as

possible. As regards the particular exhibits on the Daimler stand, these comprise a 30-h.p. 10½ ft. wheelbase chassis, painted white; 30-h.p. 11½ ft. wheelbase car, fitted with a seven-seated side entrance limousine, specially designed and built to the order of His Highness the Nizam of Hyderabad, through the agency of The Bombay Motor-Car Co.; the vehicle is painted yellow, relieved with red lines; the exterior upholstery is in red Morocco leather, while the interior seats are upholstered in cloth. The vehicle is luxuriously fitted with armchairs, electric light, speaking tube, silk spring blinds, &c.; 28-h.p. 10½ ft. wheelbase car with a five-seated landaulet body, painted blue with black mouldings, relieved with blue lines, and a 30-h.p. 10½ ft. wheelbase vehicle, with a five to seven-seated side entrance limousine body. Finally, we may mention that while the cars have been considerably improved in details, a considerable reduction in the prices of the 1907 models has been effected.

**The Darracq 40-h.p. Six-cylinder Car.**

The great centre of attraction at the stand of Messrs. HUNTLEY WALKER AND Co. is the new 40-h.p. six-cylinder Darracq car, the output of which they have entirely secured. The main frame is of pressed steel, a subsidiary one being provided to carry the engine and gear-box. The six cylinders are cast in three pairs, and have the valves all operated off a single cam shaft. The bore is 100 mm. and the stroke 120 mm. The mixture is furnished by an automatic carburettor, with a neat arrangement of admission pipes. Ignition is by gear-driven, high-tension magneto, a reserve set by accumulators being also provided. The contact-maker is located on the dashboard, and is operated by a vertical spindle and bevel gear. The water circulation is maintained by a gear-driven pump and the large ribbed-tube radiator with air-inducing fan. The clutch, which is of the leather-faced cone type, is connected with the gear-box by a shaft having a universal joint to allow for any want of alignment between the two parts. Four speeds and a reverse

Figs. 23 and 24.—Elevation and Plan of Daimler 1907 Chassis.

are provided, the control being by means of a single lever working in a "gate" at the side of the driver, this being a radical departure in Darracq cars, all of which have hitherto had the change-speed lever mounted below the steering-wheel. On the top speed the drive is direct through the gear-box, the cardan shaft, and bevel gear to a well-supported live axle. Ball bearings are used throughout, except on the engines. The road wheels, which are 880 mm. diameter, are of a special artillery type, having steel hubs and rims, with wooden spokes. The usual trio of brakes are provided, these being of great power. The car is being built in two lengths, one having a wheel-base of 10 ft. and the other 10 ft. 8 in., to allow of roomy side-entrance bodies to be fitted. On the stand is also to be seen the 100-h.p. Darracq racer driven so successfully in recent events, notably at Blackpool, by Mr. Huntley Walker.

**The Seymour-Turner Car.**

A new British built petrol car is to be seen on the stand of Messrs. SEYMOUR, LTD. It is known as the Seymour-Turner, and is constructed by Turner's Motor Manufacturing Company, Ltd., of Wolverhampton, who have hitherto confined their attention to steam cars. The 20-25-h.p. engine comprises four separate cylinders, 4-in. bore by 5-in. stroke, with the valves all operated off a single cam shaft. Big inspection doors are provided in the crank-case, and the lower half of the latter can be detached without disturbing the bearings. Ignition is by high-tension magneto. The clutch is of the Hele-Shaw disc type, and the gear-box gives four speeds forward and a reverse, with direct drive on the top speed through a cardan shaft to the rear live axle. The change-speed gear is operated by a lever working in a "gate," with a locking arrangement.

At this stand is also to be seen the 50-h.p. Vulpes light racer which has been successfully driven in several recent contests by Barriaux. A 12-15-h.p. Vulpes car was also expected, but had not arrived at the time of our visit to the stand.

#### The C.C.C. Cars.

The CHASSIS CONSTRUCTION COMPANY, Taunton, display a range of cars representative of those they are making a speciality of building for trade customers. While at all times open to construct vehicles to any specification, those on view are built up of M. and B. components, and are provided with Ballot engines, both of which are already well known for their sound and reliable construction. The chassis range from a single-cylinder 8-h.p. to a 24-30-h.p. chain-driven car, fitted with a handsome side-entrance double phaeton, with canopy. The details of the engine are all on modern lines, two systems of high-tension ignition, magneto and accumulators, being fitted. The mixture is furnished by a new carburettor, known as the T. and M., the feature of which is that three spraying jets are provided, petrol being sucked through one, two, or all the nozzles in accordance with the air supply. Attention may also be drawn to a 12-16-h.p. four-cylinder landaulet, designed to meet the Metropolitan police regulations with regard to motor-cabs. At this stand, too, Messrs. Gauthier and Co. are showing an 8-h.p. Sizaire-Naudin voiturette, of which an illustrated description has already been given in the *M.C.J.*, and for which they have just secured the British agency.

#### The New Arrol-Johnston Cars.

Far from discontinuing the manufacture of cars with two-cylinder horizontal engines, as has been reported, the NEW ARROL-JOHNSTON CAR COMPANY, LTD., inform us that not only is there no intention of abandoning this model, but orders for at least 150 vehicles are at present going through their works. The type is re-presented at the Show by a 12-15-h.p. chassis, similar in all respects to that of the winning car in the 1905 Tourist Trophy race. The model is also further represented by a graceful-looking five-seated touring car with a side entrance body, fitted with a Cape cart hood, and by an 18-h.p. side entrance car, the latter the actual vehicle driven in this year's T.T. race by Mr. J. S. Napier. The mechanical details have proved so satisfactory

Fig. 25.—The New Arrol-Johnston 24-30-h.p. Landaulet.

that they have practically been unchanged, a remark which also applies to the 24-30-h.p. car, with four-cylinder vehicle engines (Fig. 26). Special attention may be drawn to the motor, which has detachable cylinder heads and spun copper water-jackets. The method of securing the inlet valve-boxes by gate-lugs cast upon them is also worthy of notice, as is also the simple trip-gear of the low-tension ignition, actuated by the inlet-valve tappet rods. The throttle drum of the carburettor is slotted not only to apportion the supply of air at all speeds, but also to cut the mixture supply off when running down hill, and to admit only air. Special attention has been devoted to the matter of lubrication, a pump forcing oil to all parts. The clutch is of the multiple-plate type, and the change-speed gear is operated by a lever working in a "gate" quadrant. Shock upon the transmission due to sudden or careless starting is prevented by a spring-drive device on the bevel-shaft of the live axle, all the gearing of which is most accessible. The braking arrangements have been well thought out, an internal expanding brake being fitted to a drum on the bevel-gear shaft surrounding the spring drive, and internal expanding brakes to the rear wheel hubs. Roller bearings are provided to all parts of the transmission, from clutch to driving-wheels, any thrust being taken by ball races. Lastly, a most interesting exhibit on the Arrol-Johnston stand is the Doolittle removable rim, the invention of Dr. Doolittle, president of the Toronto Automobile Club. With this rim, for which the New Arrol-Johnston Car Company have secured the manufacturing rights in the United Kingdom, the damaged tyre can be removed, cover and all, and a spare one fully inflated can be put on in thirty seconds. Without illustrations it is somewhat difficult to describe the new rim, so that a full notice of it must be reserved until a later issue.

#### The Pilain Cars.

Mr. A. PILAIN exhibits two Pilain cars, one of 18-24-h.p. and the other of 20-30-h.p. The special features of these vehicles comprise a direct drive, or third and fourth speeds, an atmospheric brake in connection with the carburettor, the system of transmission by which the back wheels do not get out of alignment through wear. The governing movement of the differential is made by means of a cardan

joint on the countershaft, which also carries the differential, and is attached to the driving wheels by two gears, protected by gear cases. The back wheels, which have ball bearings, being carried on a fixed axle.

#### The Enfield Cars.

The new models—15-h.p. and 25-h.p.—of the ENFIELD AUTOCAR COMPANY, LTD., are attracting considerable attention; as, however, a full description was given in the *M.C.J.* of the 3rd inst., it is only necessary to refer to the principal features. The engine of

Fig. 26.—Elevation of chassis of the 24-30-h.p. New Arrol-Johnston Car.

the 15-h.p. car comprises four vertical cylinders, 95 mm. bore by 115 mm. stroke. A noteworthy point about the motor is the liberality of the water jackets and the general accessibility. The ignition is by accumulators and coil; the current being distributed to the plugs by a wipe contact. The two levers which control the throttle and the spark are situated above the steering wheel, and so arranged that they retain their respective positions irrespective of the wheel. The radiator is of special design; it is composed of corrugated films which have the appearance of a honeycomb type, but is claimed to be much stronger. The cellular or radiating portion is edged over so as to provide additional protection against leakage. The change-speed gear, which is operated by a lever working in a "gate," provides three speeds forward and reverse, with direct drive on top; a large inspection cover gives access to the gear-box, and, if necessary, the gear can be removed without difficulty, without disturbing other portions of the car. The transmission is through a cardan shaft and bevel gear to a live axle. The 25-h.p. model is generally on the same lines as the 15-h.p., the bore and stroke of the engine being 120 by 135 mm. respectively. The new models are not only moderate in price, but of sound construction, and ere this time next year we expect to see a good many of them on the road.

#### The Siddeley Cars.

The 1907 models of the Siddeley cars were so fully described and illustrated in the *M.C.J.* of the 10th inst. that it needs only be mentioned that the exhibit of the WOLSELEY TOOL AND MOTOR-CAR COMPANY, LTD., comprises examples of the 10-h.p. two-cylinder, fitted with double phaeton body, an 18-h.p. vehicle, a 30-h.p. live axle landaulet, with landaulet body by Hooper, this being a similar vehicle to that ordered by H.M. Queen Alexandra; a 40-h.p. with double landaulet body, canopy, and folding glass screen; the 15-h.p. limousine which won the gold medal

Fig. 27.—Elevation and plan of the Siddeley 45-h.p. Six-Cylinder Car.

in the recent Town Carriage Competition; and chassis of the new 30-h.p. four-cylinder and 45-h.p. six-cylinder vehicles. We give an elevation and plan of the latter in Fig. 27, and may mention that the six cylinders, which are 4½ in. bore by 5 in. stroke, are cast in two pairs. Dual ignition is fitted, and the clutch is of a new metal-to-metal design. The transmission is by side chains from the differential shaft, which carries two powerful foot brakes. Altogether the car is an excellent specimen of engineering, and reflects much credit on its designer.

**The Airex Car.**

Motorists on the look-out for a small car at a moderate price should be interested in the new vehicle known as the Airex (Fig. 28), which has just been introduced by the REX MOTOR MANUFACTURING COMPANY. Fitted with a side-entrance double phaeton on a pressed steel frame, it

Fig. 28.—The Airex 8-h.p. Car.

has accommodation for four passengers. The motive power is supplied by a 9-h.p. double-cylinder V-type engine, the bore and stroke being respectively  $3\frac{1}{4}$  in. by  $3\frac{1}{4}$  in. Ignition is by coil and accumulator, the contact-maker being located in front of the framed ribbed-tube radiator. The power is transmitted through a leather-faced cone clutch, a gear-box giving three speeds forward and reverse, cardan shaft, and bevel gear, to a well-designed live axle. On top speed the drive is direct, the square shaft in the gear-box engaging the cardan shaft by means of a claw with three projections, fitted with ball bearings. When on top speed, the secondary shaft remains stationary. On each side of the differential casing on the live axle is fitted a ball bearing, which can be adjusted from the outside by means of a screwed cup. The rear road wheels are also mounted on a ball bearing with a double row of balls. Altogether, the new car is of pleasing outline, and forms a notable addition to the list of moderately-priced cars.

**The Napier Cars.**

That Messrs. S. F. EDGE, LTD., have faith in the six-cylinder cars which they have so prominently kept to the front in recent

Fig. 29.—The Napier six-cylinder engine.

months is fully evidenced by the fact that their exhibit is entirely confined to this type of vehicle. The machines on view include a 40-h.p. chainless chassis, a 60-h.p. chainless Pullman limousine, and two 40-h.p. chain-driven cars. Briefly dealing with the features of the chassis, it

will be seen from the photograph of the engine reproduced in Fig. 29 that the six cylinders are cast in pairs, with the inlet and exhaust valves—which are interchangeable—on the same side, and actuated by one cam shaft. The cams are part of the solid shaft, and the whole valve-operating mechanism is entirely enclosed and protected from dust, and automatically lubricated. The ignition is by means of accumulators and coil, with synchronised high tension distribution. The single coil, with the contact-maker, is located on the dashboard, and is therefore easily accessible. The cylinder heads are provided for two sets of plugs, so that dual ignition—magneto and accumulator—can be provided if desired. The cooling water passes in at the bottom of each cylinder, and emerges at the top, so that the circulation, which is maintained by a pump, is also assisted by an arrangement of the pipes which possesses the advantage of the thermo-syphon system. In front of the engine there is a solid aluminium fan for drawing air through the radiator. As regards the lubrication of the engine, the oil is forced by means of a direct-driven pressure pump into the centre of each bearing under several pounds pressure, thus separating the shaft from the bearing by a thin film of oil. After the oil has done its duty, it falls into the base chamber, and after filtering into the pump-well is again pumped through the bearing. The result of this system is that very little oil is required, as it is used several times over, and that the engine cannot be over-lubricated, and, therefore, cannot emit smoke, the whole system being perfectly automatic. The clutch is of the metal-to-metal type, the faces being automatically oiled when withdrawn, which prevents any shock when it is inserted, and enables it to be slipped as much as required in traffic without fear of damage. The chassis is supported on five springs, the usual four longitudinals being supplemented by a transverse spring at the rear, while in addition "equalisers" are fitted to the springs, which eliminates all sudden jolts, thus greatly minimising the fatigue of travelling. The gear-box gives three speeds forward and reverse, with direct drive on top, without the use of any loose gear-

Fig. 30.—The Napier Six-Cylinder Touring Car, with Cape cart hood and folding glass screen.

wheels. Ball bearings, it may be added, are used throughout the chassis, except on the engine. Passing now to the actual cars on view, it may be stated that the 60-h.p. Pullman limousine has been built to the order of the Duke of Fife. It is mounted on a chassis having an extra long wheel base, viz., 11 ft. 6 $\frac{1}{2}$  in.; it is constructed to carry seven persons, the interior being fitted with comfortable seats for three passengers across the back of the car, and two large comfortable semi-revolving seats or armchairs. A canopy extension is provided over the driver's seat, with large glass wind shield, arranged to slide into the roof, and the roof of the rear portion of the carriage is arranged to carry luggage. The upholstery is on the most luxurious lines, and, together with the painting, is in the Duke of Fife's own colours. The 40-h.p. chassis is fitted with a double landaulet body of special design, arranged to carry five persons in the interior and two on the driver's seat. The upholstery of the interior is in drab cloth material, and the paintwork in a special selection of vertical stripes in dark green colours. Fig. 30 depicts the 40-h.p. chain-driven car, fitted with roomy side-entrance touring body, the seating accommodation of which is for seven persons. A waterproof Cape cart hood is provided, which, when folded down at the back, forms a dust screen, but when raised over the passengers, in conjunction with the folding glass wind shield, affords protection against the worst weather. A detachable and folding luggage grid is fitted at the back of the car, while accommodation for carrying spare tyres is provided at the side of the driver's seat. Space for tools is also arranged under both seats, and in a well underneath the tonneau floor, the car being specially fitted out for touring purposes. Needless to say, the Napier cars have been the object of much attention during the week, and fully repay any time spent on an inspection of their many interesting features, to but a few of which, owing to the pressure on our space, reference has been possible.

**The North British Car.**

A new car, known as the "North British," and made by the North British Motor Manufacturing Company, Ltd., is to be seen at

the stand of Mr. A. C. PENMAN. The vehicle is on the usual lines of cars with cardan shaft drive and live axle. The engine has four cylinders, 3½ in. bore by 4 in. stroke; they are cast in pairs, with all the valves arranged on opposite sides. The water circulation is on the thermo-siphon system, no pump being employed, while another feature of the motor is that the crank shaft is *desaxé*, or slightly out of line with the centre of the cylinders. Both hand and foot control of the throttle is provided, while the gear box is adapted to give three speeds forward and a reverse, with direct drive on top speed. The vehicle, which is fitted with a side entrance double phaeton body, appears to be of sound and reliable construction. Mr. Penman, who has achieved an excellent reputation as a motor body builder in Scotland, also displays a 24-h.p. Albion, fitted with a special landaulet body, and a 16-h.p. car of the same make, fitted up as a brougham, with a detachable top.

#### The Britannia Cars.

A new addition to the list of British-built cars is the Britannia, made by the BRITANNIA ENGINEERING COMPANY, LTD., of Colchester, an old-established firm of machine tool builders. The selling rights in the new vehicles have been secured by the Victoria Carriage Works, Ltd., who are exhibiting a polished chassis of the 18-24-h.p. model. No subsidiary frame is used, the engine and gear-box being bolted direct to the main pressed steel frame by means of side bolts. The four cylinders are cast in pairs, and the bore and stroke is respectively 104 mm. by 130 mm., and the normal speed 1,000 revolutions per minute. The valves are located on opposite sides, and are actuated by separate cam shafts, the driving gear of which is enclosed in the crank case. The water circulation is maintained by a gear-driven pump, which can be readily taken down. The radiator is of the honeycomb type, with air-inducing fan, the latter being supported on an eccentrically-

mechanism, the lubricating rack and switch being the only fittings. A special gun metal tray is provided to prevent the possibility of any oil dripping on the sloping footboard. A novel fitting is seen in the heel plates fixed on the sloping footboard, below the pedals, so that the driver may have a firm control of the latter. The frame is supported on five long springs, the shackles of which are fitted with lubricators. One of the complete cars on view is fitted with a removable top limousine body, and the other with a Roi des Belges double phaeton, both being the work of the Victoria Carriage Works, so that it is almost needless to say they are of a very high order. Altogether the new Britannia vehicles form a noteworthy addition to the list of British cars, and an inspection of the chassis on view can be recommended to all motorists. We understand that the Britannia Company are also building 12-16-h.p. four-cylinder and 24-40-h.p. six-cylinder cars on similar lines. The Victoria Carriage Works Ltd., also display a 25-30-h.p. Leon-Bollee car, with landaulet body.

#### The Rochet-Schneider Cars.

For the 1907 season four sizes of the well-known ROCHET-SCHNEIDER cars are being built—16-20-h.p., 20-24-h.p., 30-35-h.p., and 40-50-h.p. The first two have live axles and the others side chain drive, while all are being made in two lengths of wheel base. Messrs. DONNE AND WILLIAMS, LTD., the British concessionaires for these vehicles, exhibit a polished chassis of the 16-20-h.p. type, which is attracting considerable attention. The engines are all of the four-cylinder vertical type, cast in pairs. The valves, which are mechanically operated and interchangeable, are located on opposite sides. To facilitate starting the three larger sizes of motors are fitted with an independent half compression device. In the 16-18-h.p. model, Simms Bosch high tension magneto is used, while in the other types the magneto is of the low

Fig. 31.—Chassis of the Britannia 18-24-h.p. Car.

mounted spindle, so that any slack in the driving belt may be readily taken up. The carburettor is of the automatic air-regulating variety. Two systems of ignition, high or low tension magneto and accumulators, are provided. In the chassis on view the ignition is by low tension magneto; the tappets, which are located on the inlet side are a special feature, as the whole operating mechanism is lubricated by the oil in the crank chamber. The spark itself can be seen and adjusted by simply removing a cap similar to one of the valve caps. Besides this, there is a passage only one quarter of an inch in diameter between the tappet chamber and the inlet valve, which renders it possible to run the engine with any quantity of lubricating oil without it affecting the ignition. Lubrication is effected by means of a tank fixed to the side of the chassis, kept under pressure by means of the exhaust, and a 4-drip sight feed rack on the dash conveys the oil to each pair of cylinders, the crank case, and the bearings in the gear-box. The ignition and throttle levers work on a sector above the steering wheel, which does not rotate with the latter. Between the main throttle, which is controlled from the steering column, and the inlet valves is a special butterfly valve, connected with the clutch pedal, so that when the clutch is withdrawn the speed of the engine is automatically cut down. The clutch is of the leather-faced cone type, fitted with flat expanding springs. A universal joint is provided between it and the gear-box, and the tension of the clutch spring can be adjusted by simply turning one split brass nut. The gear-box is provided with long bearings, and a cover practically as large as the whole of the case, thereby facilitating the inspection of the gears. Three speeds and a reverse are controlled by a single lever, working in a "gate" quadrant. The transmission from the gear-box is by a cardan shaft and bevel gear to a well-supported live axle. The cardan shaft is of solid steel with square ends, brazed solid to the universal joints. The back axle is fitted with Hoffman's ball bearings. The dashboard is clear of all

tan ion variety, with make and break tappets. The latter are fitted with mica insulators, detachable, so as to easily permit of their being cleaned without interfering with the timing. The cylinder dimensions of the different sizes are: 16-20-h.p., 100 mm. bore by 120 mm.; 20-24-h.p., 100 mm. by 140 mm.; 30-35-h.p., 120 mm. by 160 mm.; and 40-50-h.p., 140 mm. by 160 mm. The lubrication of the cylinders is effected by means of a gear-driven pump, which supplies a drip feed rack on the dashboard. The supply of oil is proportionate to the speed of the engine, and can be regulated as desired. The oil tank is placed under the bonnet, and serves to feed the pump which distributes the drip-feed. Except in the 16-20-h.p. model the petrol is pressure fed to the carburettor. The mixture is furnished by a new patent carburettor, which automatically regulates the carburation in accordance with the engine speed, and at the same time greatly reduces the consumption of petrol. The engine is controlled by means of two levers placed above the steering wheel, one operating the throttle and the other the ignition. To facilitate the location of irregular firing each cylinder can be cut out separately, and to minimise noise, the gear wheels actuating the cam shafts, magneto, and water-circulating pump are all enclosed in the same casting as the crank chamber, and run in oil. Governors are fitted to the three larger cars; the 16-20-h.p., which has been specially designed for town work, has a novel system of control; the clutch is so connected up with the throttle that when the former is withdrawn by pressing forward the pedal the speed of the engine is cut down; a further pressure on the pedal just before letting in the clutch accelerates the motor ready to take the drive. The 16-20-h.p. and 20-24-h.p. models are fitted with a leather-faced cone clutch of large diameter. The other types are provided with a metal-to-metal clutch, formed by a segment fitted in a metal case connected to the flywheel by means of studs provided with flexible rings. The 16-20-h.p. car has three forward speeds and a reverse, while the others have

four speeds, the control in all cases being by a single lever working in a "gate." The change-speed gear, which gives a direct drive on the top speed, is the same as fitted to the 1906 cars; the two gear shafts are in the same plane, and to avoid torsion of the sprockets in the chain-driven cars the two halves of the differential shaft are the same length. A feature of the live axle cars is that the cardan shaft is

Fig. 32.—The Bental 9-h.p. three-seated Car.

enclosed in a casing, which is supported independently, and practically acts on the torque rod, two radius rods being also fitted. Great attention has been given to the suspension, and by the adoption of a system of three springs at the rear road shocks have been largely eliminated. We may add that ball bearings of the D.W.F. type are fitted throughout, except on the engine. Of the complete cars on view special attention may be drawn to a 40-50-h.p. model with a seven-seated Roi des Belges phaeton body.

#### The Bental Cars.

Built by the old-established engineering firm of Messrs. E. H. BENTALL AND CO., of Heybridge, Essex, the new Bental cars are not only a noteworthy addition to the list of British-built vehicles, but form, by reason of their novel design, one of the most interesting ex-

Fig. 33.—Part-sectional elevation and plan of Bental 16-h.p. engine.

hibits in the Show. Three sizes are being made, 9 and 11-h.p. two-cylinder and 16-h.p. four-cylinder. The following remarks, while based more particularly on the 16-h.p. type, may be taken as applying in general to the smaller models. As will be seen from Fig. 33 the cylinders are separately cast and are of a special curved shape, which enables the camshafts to be brought closely to the crankshaft and the gearing to be proportionately reduced in size, so diminishing the peripheral speed. The valves are mechanically operated and are placed on opposite sides of the cylinders. The

crankcase has a bottom cover which can be removed independently of any other part and enables the crankshaft, which is of the built-up type, connecting rods, and pistons to be withdrawn bodily from below without dismantling any other part. The ignition is by low tension magneto. Simple means are provided for regulating the spark in each cylinder, and also for taking up wear. The whole of the ignition mechanism on the top of the cylinders can be removed and does not require re-adjustment when replaced. By a special trip gear the break of the contact of the hammer with the plug is as rapid when the motor is turned by hand as when it is running fast, thus ensuring easy start-

Fig. 34.—Elevation of Bental 29-h.p. Car, showing novel system of transmission.

ng. The clutch is of the internal cone type, running in oil. The contact surfaces are Woodite (wood fibre) to metal, which is claimed to constitute a clutch of ample gripping power and yet never fierce. The change-speed gear, which is adapted to give three speeds forward and a reverse with direct drive on top speed, is controlled by a lever working between two notched quadrants held together by springs. The great novelty in the car, however, lies in the transmission, which is by bevel gear on to a live axle. The gear-box has no connection with the frame but is supported at the front end by the main gearshaft being carried in a universal trunnion bearing held in a bracket from a cross-member. At the rear the support is by two rigid radius rods extending to the back axle casing. The shaft which connects the gear-box with the live axle cannot be termed a cardan in that it has, in contradistinction to the usual practice, no universal joints whatever, it being enclosed in a sleeve which is rigidly bolted up at each end. It is claimed that the new type of transmission, which has been subjected to a long trial ere being put on the market, secures the following important advantages:—It removes a source of trouble arising from rapid wear of universal

Fig. 35.—Sectional plan View of Live Axle on Bental Cars.

joints, and consequently reduces noise and vibration; it simplifies construction; reduces friction; ensures alignment; obviates necessity of torque and radius rods; and makes distortion of the cardan shaft impossible. There is no question that the departure is an interesting one, this being proved by the notice which has been given to it by engineering visitors to the Show. The weight of the car is carried by the axle sleeve, the axle proper conveying the power to the rear road wheels through its tapered ends, on which the hubs are keyed. Semi-elliptic springs are employed at the front of the pressed steel frame and double elliptic at the rear, while ball bearings are fitted throughout, except on the engine. The complete cars on view include a 9-h.p. with detachable brougham top and a phaeton with spider seat at the rear (Fig. 33). We may add that Messrs. James and Whittall are the selling agents for the new vehicles.

### The Regent Cars.

Three highly-finished examples of the 18-h.p. Regent cars are staged by the REGENT MOTOR COMPANY, one being fitted with a landaulet body and the others with standard touring bodies, with Cape cart hood and folding wind shield. Special attention has been paid in the landaulet to secure a perfectly noiseless vehicle. To this end all the windows have bevelled edges and are fitted in cloth slides, so that rattling is prevented. All the interior fittings are silver-plated and ivory, while the upholstery is of a fawn shade Bedford cord. The driver's seat has an extension top, and the folding head over the passengers has an automatic locking device so that it can be raised or lowered from the interior. As regards the details of the chassis, the frame is pressed steel, the side members being narrowed in front to afford ample steering lock. The engine is supported by the crank chamber brackets directly on main frame, and placed in front of the crank chamber is an independent gear-case, affording a dust and oil proof accommodation for the cam shaft, magneto and water pump driving gear. The four cylinders, which are 90 mm. bore, 120 mm. stroke, are cast in pairs, with the induction valve chambers on the right and the exhausts on the left. The two cam shafts are outside the crank chamber, and are held in position by detachable cover plates, making them readily accessible. Over each cam shaft are two independent cover plates, secured obliquely to the wall of the crank chamber, and carrying the guides for the valve tappet rods. The ignition is by low tension magneto, driven off the inlet valve cam shaft. The make and break plugs are mounted on ignition plates, bolted to the flanks of the induction valve chambers, and are operated by ignition tappet rods, actuated by cams on the induction camshaft. In order to vary the timing, movable rollers suitably supported in guides are connected by levers to a rocking shaft carried in brackets on the crank chamber. This shaft can be partially rotated by the ignition lever on the steering wheel, the levers being thereby rocked over, so as to cause the rollers on the lower ends of the ignition tappet rods to come into earlier or later contact with the ignition cams, and so vary the moment of breaking

Fig. 36.—The Regent 18-h.p. Landaulet.

contact, and consequently of firing the charges. The carburettor is accessibly placed on the same side as the magneto, and has the regulation form of float-feed chamber, obtaining petrol from the rear tank under pressure. No automatic air valve is fitted to this apparatus, but the throttle valve is connected to an auxiliary valve, which allows the proportionate ingress of air as the throttle is opened. The throttle lever on the steering wheel is connected to the governor, the operation of which is thereby regulated as desired. The water circulation is maintained by a honeycomb radiator with fan, and a pump of the centrifugal variety. Large inspection doors are fitted in the crank chamber. A device which assists in rendering the engine exceedingly silent in operation is that which obviates any clearance between the valve tappets and valve stems, this being obtained by spiral springs on the tappets, which keep the latter continuously in contact with the valve stems. The drive passes from the engine to the change speed gear-box through an ordinary form of leather-faced cone clutch, to meet which on withdrawal a spring plunger brake is fitted. The clutch and clutch shaft can be easily dismounted and withdrawn by detaching the coupling provided. The gear-box is adapted to give three speeds forward and reverse, with direct drive on top speed. Both the primary and secondary shafts rotate on ball bearings. From the gear-box the power is transmitted by a cardan shaft and bevel gear to the live axle. The propeller shaft runs in a long casing, carried in the socket forming part of the differential gear-case. The differential gear-case is divided horizontally, the upper half being easily detachable, making the inspection of the driving wheel and the crown wheel a comparatively simple matter. The cars, we may add, have a wheel base of 9 ft. 3 in., and an over-all length of 12 ft. 9 in.

### The Jackson Cars.

One of the exhibits appealing particularly to the motorist of moderate means is that of Messrs. R. REYNOLD JACKSON AND Co., who have a range of the Jackson cars on view. They are all on modern lines, being fitted with pressed steel frames, push pedals, framed

ribbed-tube radiators, and transmission by cardan shaft and bevel gear on to live axle. The well-known Jackson dog-cart is supplied with De Dion 5-h.p. or 6-h.p. engines, three speeds and a reverse being provided on both models. The 64-h.p. phaeton is a neat machine, the rear seat, access to which is through a tilting front seat, being removable, rendering the car well adapted for commercial or station work, as a large amount of luggage can be carried. The 9-h.p.

Fig. 37.—The Jackson 64-h.p. Phaeton.

vehicle can be supplied either with a De Dion single-cylinder or Gnome double-cylinder engine; it is built either as a two-seated or four-seated dog-cart, or as a standard side-entrance double phaeton. The latter is mounted on a longer chassis than usual, and a specially strong back axle. The ignition and throttle levers are also mounted above the steering wheel.

### Electrical Cars.

Only two firms are exhibiting electrically-operated vehicles, the ELECTROMOBILE COMPANY, LTD., and Mr. CARL OPPERMANN. The former concern is showing four types of carriages. The chassis is identical in each case. The motor is of a normal 8-h.p. at 1,500 revolutions; it is of the ironclad type, bi-polar and series wound, having two separate commutators each connected to its own armature windings. The transmission is through a duplicate train of double helical gearing direct to the differential, and thence to the hub of the rear wheels by live shafts, which revolve in an external tubular axle. Mr. Oppermann's new vehicle, which is designed for public service as a motor-cab, is constructed with an independent chassis. The springs are of ample length, and the body is so well hung that pneumatic tyres are only used on the hind wheels, whilst solids are used on the front. The motor, which runs at 1,000 revolutions per minute, is of 6-h.p.; it is of the four-pole type, with former wound armature and laminated field magnets, compressed copper commutator, and twin carbon brushes. The motor drives the intermediate shaft, which carries a differential gear, by means of a silent chain, the power thence being conveyed by side chains to the rear road wheels. All the chains run in dust-tight aluminium gear-cases. The controller is arranged to give four forward speeds. The battery consists of forty-four pasted-type cells, fitted into ebonite boxes carried in a strong teak tray, secured underneath the chassis, and designed so that it can be bodily removed when discharged and a new one put in its place in a few moments. The capacity of the battery is 150 ampere hours, sufficient to drive the vehicle, the total weight of which is 27 cwt., a distance of forty-five miles, although a run of sixty-two miles has been made on one charge. A number of these vehicles, fitted with taximeters, are shortly to be placed in service in London.

Fig. 38.—The Singer 7-h.p. Two-seated Car.

### The Singer Cars.

The new models of the Singer cars having been described and illustrated in the M.C.J., of the 10th inst., it need only be remarked that the SINGER COMPANY are exhibiting examples of their 7-h.p. double-cylinder (Fig. 38), 12-14-h.p. four-cylinder, and 20-22-h.p.

touring car, with Aster engine, and a three-cylinder, 10½-h.p. vehicle. Ball bearings are employed in the gear-box, main axle-wheels, and steering centres. The "gate" speed change gear system has been introduced, with automatic neutral position of lever, while another important feature is the sectionalised system of construction. The gear-boxes, foot levers, steering gear and engine, "gate" change mechanism, cardan shaft, back axle, &c., are all erected as distinct units, and can be easily and separately detached without disturbing any other parts.

#### The Isotta-Fraschini Cars.

The Isotta-Fraschini cars (Fig. 39) which made their debut at the Agricultural Hall Show in March last, have quickly gained a prominent position in the motoring world. They are of the highest class of Italian construction, as an inspection of Messrs. HALL CAPRIS AND Co.'s exhibit will show. Two sizes are exhibited, 28-35-h.p., and 50-65-h.p., both being fitted with side chain transmission. As the vehicles have already been fully described in the *M.C.J.*, it is unnecessary to deal with them at any length, but it may be mentioned that the motors have the valves operated off separate cam shafts, and that the ignition is by high tension magneto. The flywheel is adapted to act as a fan, while the clutch is of the multiple disc type. The usual brake on the differential shaft is supplemented by one on the forward end of the gear-box side shaft. An attraction on the stand is a 120-h.p. racer, one of a number the Isotta-Fraschini Company have built for next year's speed contests. The engine is of a special design, the inlet and exhaust valves, which open directly into the explosion chambers, being operated by an

compared with last year's pattern, it now having, similarly to the first Vulcan cars, a universal joint at each end, both the shaft and the joints being encased. The engine is provided with both foot and hand control, and the car, which has a wheel-base of 10 ft., is adapted to receive any type of carriage body. We may add that ball bearings are used to all parts, except the motor. The Vulcan 20-h.p. car is on similar lines to the foregoing, the main difference being in the engine, which comprises only four cylinders, of the same bore and stroke as that employed in the "six." It is well adapted to receive side entrance bodies, the landaulet on view forming an excellent town carriage. The 14-h.p. Vulcan differs in but few respects from the 20-h.p.; the cylinder dimensions are 3½ in. bore by 4½ in. stroke. The ignition is by accumulators, and the quadrant. A new model is seen in the 12-h.p. four-cylinder car, the price of which brings it within the range of many would-be motorists. It is on the usual Vulcan lines, the change-speed gear giving three speeds forward and a reverse, while the rear live axle runs on ball bearings. Altogether the exhibit shows that the Vulcan Company, while keeping the cost of their productions within moderate limits, intend to maintain them thoroughly up to date.

#### The Mayfair Cars.

Messrs. G. L. M. DORWALD AND Co., as agents of the Mayfair Motor Company, Ltd., display a trio of the Mayfair cars, of which a description was given in a recent issue of the *M.C.J.* These include a 6-h.p. two-seated car, fitted with a De Dion engine, a 15-h.p. four-cylinder car, and a 16-20-h.p. chassis. These are all on

Fig. 39.—Chassis of Isotta-Fraschini 28-35 h.p. Car.

overhead cam-shaft. The latter is operated by bevel gear and a vertical spindle off the crankshaft, the mechanism being also arranged to drive the magneto, which is mounted on the dashboard in front of the driver. The complete cars on view include a 28-35-h.p. three-quarter landaulet and a 50-65-h.p. limousine. On a separate stand Messrs. Hall and Co., of Tonbridge, are showing four of these cars all provided with high-class bodies, a notable one being an 18-22-h.p. fitted up as a coupe.

#### The Vulcan Cars.

The VULCAN MOTOR COMPANY, LTD., Southport, the agents for whom are the London and Parisian Motor Company, Ltd., have an excellent display of moderately-priced cars, ranging from a 12-h.p. four-cylinder to a 30-h.p. six-cylinder. The latter is the company's latest production, and will well repay inspection. The engine has the cylinders cast in three pairs, the bore and stroke being 3½ in. by 4½ in. The valves are arranged on opposite sides, operated off separate cam shafts, and two systems of high tension ignition—magneto and accumulators, the latter having a synchronised high tension distributor. The clutch is of the leather-faced cone type, and the gear-box, which is controlled by a lever working in a "gate," is adapted to give three speeds forward and a reverse, with direct drive on top speed. The transmission is by a cardan shaft and bevel gear to a rear live axle. The latter has only the driving strain to withstand, the weight of the car being carried by the axle sleeve. The power is communicated to the hubs of the rear road wheels by dog clutches on the ends of the live shafts. The details of the vehicle are all on modern lines; for instance, a joint is provided between the clutch and gear-box to allow for any want of alignment between the two parts, and also to enable either to be dismantled without disturbing the other. The cardan shaft, too, has been altered, as

the standard lines of live-axle vehicles, and their moderate price, combined with sound construction, render them well suited for motorists of moderate means. The largest car is fitted with a four-cylinder engine, having a bore of 98 mm. by 130 mm. stroke. In addition to the usual four longitudinal springs, a transverse one is fitted at the rear, which greatly adds to the easy-riding qualities of the vehicle. Messrs. Dorwald also exhibit a 30-40-h.p. four-cylinder engine of their own design, and adapted to run on either petrol or paraffin, the special automatic change-over carburettor recently illustrated in these pages being fitted. The four cylinders are 5½-in. bore by 5½-in. stroke. The crank shaft is *desaxé*—that is to say, it is set slightly out of line with the centre of the cylinder, the advantage of this arrangement being that during the explosion stroke the connecting rods are practically vertical and parallel with the sides of the cylinder, thus reducing side thrust on the walls of the latter. The valves are located on opposite sides, the two cam shafts being operated not by the usual spur wheels, but by worm and worm wheels, which run in oil in the crank chamber. Special attention has been paid to the question of accessibility, while all the parts are made on the interchangeable system.

#### Messrs. J. Keele & Co.'s Exhibit.

Messrs. J. KEELE AND Co.'s exhibit is a varied one, comprising as it does examples of the latest types of Darracq, Spyker, and Enfield cars, the last named being the most recent additions to their list of agencies. The Darracq cars on view include a 20-28-h.p. Darracq of the new type, in which the change-speed lever works in a "gate" at the side of the driver; it is fitted with a roomy side-entrance double phaeton body. Another vehicle of the same make and power is equipped as a landaulet, the body being of English construction, as

is also that mounted on the 10-12-h.p. Darracq chassis, this being one of Messrs. Keele's specialities. The Spyker car on view is one of the 14-18-h.p. models, with double phaeton body. The new 15-h.p. Enfield car, of which a description was given in a recent issue of the *M.C.J.*, had not arrived at the time of our visit to the stand. The one expected is fitted with a landaulet body, and has doubtless put in an appearance ere these lines are published.

#### The Mitchell Landaulet.

The new concern, MITCHELL MOTORS, make their *début* with a landaulet representative of a number they shortly intend to put in

Fig. 40.—The Mitchell Landaulet, of which a number are shortly to be put in service as motor-cabs in London.

service as motor-cabs in London. The vehicle, of which a general view is given in Fig. 40, is of pleasing design, the engine being located under the driver's floor-board, the usual bonnet being thus dispensed with. At the same time special attention has been devoted to rendering all its parts accessible. The motor is a White and Poppe four-cylinder, developing 14-h.p. at 1,400 revolutions per minute; it is provided with accumulator ignition, and is controlled by levers on the steering column. The clutch is of the leather-faced cone type; the gear-box is of the Soames pattern, in which the gears are always in mesh. This has been adopted in view of the cabs being driven by ordinary cabmen, it being impos-

#### The Crossley Cars.

Special interest attaches to the Crossley car stand of Messrs. JARROTT and LETTS, LIMITED, for, although somewhat unfortunate in its location, it has on it the chassis of the latest 30-h.p. Crossley live axle car, noteworthy not only on account of the new design but because of the fact that it is entirely the production of Messrs. Crossley Bros., Limited, the well-known Manchester firm of gas engine builders. The engine, which has the four cylinders cast in pairs, has a bore of  $4\frac{1}{2}$  in. and a stroke of 6 in.; and, although rated at only 30-h.p., develops over 40-b.h.p. The interchangeable valves are of large diameter and mechanically operated, the inlets being on the right and the exhausts on

Fig. 41.—The new Crossley 30-h.p. live axle Car.

the left side. A simple half compression gear is fitted to make starting of the easiest nature. The cam shafts and timing wheels are enclosed in oil-tight cases. Taps are fitted in the crank chamber, which can be opened by a lever from the dashboard to regulate the proper height of oil. Plugs are also fitted to drain out the oil when required. The motor is lubricated by pressure through eight feeds on the dash, one sight being provided for each half of the crank chamber respectively, and a third one for the oil distributed to the pistons. Ignition is by low tension magneto, which can be advanced and retarded as required. The water circulation is maintained by a positively driven centrifugal pump and a large honeycomb radiator with fan. The Xenia carburettor is retained; this is automatic in its action, and when set by the

Fig. 42.—Plan of Chassis of the new Crossley 30-40-h.p. live axle Car.

sible to change gear without the clutch is first withdrawn. The change-speed lever itself is mounted on the top of the steering wheel, instead of at the side; it operates a selector bar in the gear-box, which controls clutches by means of which any pair of pinions can be made to transmit the power by dog clutches. On the top speed the drive is direct. The car exhibited is fitted with side-chain transmission, but a live axle model is also being made. The car has a wheel-base of 6 ft. 10 in., and is capable of turning within the circle prescribed by the Metropolitan police authorities.

makers is correct for the proper mixture at all speeds. The petrol supply to the carburettor is by pressure from a tank carried at the rear end of the chassis. The clutch is of the expanding metal-to-metal type as formerly used on Crossley cars, but with certain modifications in the way of facilitating adjustment. The shaft between the clutch and the gear-box is fitted with universal joints. The change-speed gear gives four forward speeds and one reverse with direct drive on top, all operated by one lever working through a "gate." The gear-box is of a new type, having only one horizontal joint—that for the top cover; the gear,

shafts can be withdrawn and replaced in position at the ends by removing a circular flange; the latter contains a stuffing-box and gland, which can be tightened up on the felt packing as required. The selector or operating gear all lies in the bottom of the gear-box, and is not disturbed when the gear wheels are taken out. From the gear-box the transmission is by a cardan shaft, universally jointed at both ends, and bevel gear to a rear live axle; the latter is of exceptional strength, the road wheels are carried on the outer casing, within which revolve the two parts of the live axle, which communicate the drive to the road wheels through star clutches in the hubs. The live shafts may be withdrawn by removing the hub caps and a small clip, so that the whole of the differential can be taken out by removing the cover of the outer casing and two clips inside. This can be done without removing either road wheel, spring, or any connections. Ball thrusts are fitted to both the differential wheels on the driving shafts and the inner differential box. The steering gear is of the worm and segment type, and is so fitted that it can be raised or lowered as may be required. The control levers for the throttle and ignition are fitted on the top of but do not turn with the steering wheel; a foot accelerator is also provided. The silencer is of effective pattern, and is made so that it can be readily taken to pieces for cleaning purposes. The braking system is unusually powerful; one pedal controls the clutch, a second the clutch and a contracting brake on the rear end of the cardan shaft, and a third a similar brake behind the gear-box. In addition a hand lever actuates compensated internal expanding brakes working in drums attached to the rear road wheels. All the brakes are fitted with a simple means of adjustment which does not require the use of any spanner or tools. The car has a wheel base of 10 ft. 3½ in., and a track of 4 ft. 8 in. Although not exhibited, a chain-driven model on similar lines to the live axle car, except as regards transmission, is made, so that purchasers may have their choice of drive. In addition to the chassis a 40-h.p. car with double landaulet body to carry six persons and a 40-h.p. Roi des Belges double-phaeton are also on view. Altogether the new Crossley cars fully uphold the reputation of their builders and form a noteworthy addition to the growing list of British-built automobiles.

#### Wind Shields.

A very complete range of brass work—fittings and the like—for use in motor-car production is shown by Messrs. LOWE, BEVAN AND CO., whose specialities in wind shields may always be regarded as cer-

Fig. 43.—The "Pioneer" Wind Shield.

tain to include some good ideas. The Simplex wind shield, which we noted last year as embodying many points of convenience, and capable of being folded down without interfering with the line of vision, has been improved, and instead of being secured by a screw is now locked by a lever, which thus simplifies the operation—a point of advantage in motoring, especially in bad weather. The "Pioneer" wind shield, illustrated in Fig. 43, is another excellent device. Often does the glass become blurred by rain with consequent discomfort to the driver, but in the "Pioneer" the window can be sloped at such an angle that the rain is kept from the driver, and an unobstructed view still given of the road ahead. The shield is automatic in action, and can be easily regulated by a lever. In Cape cart hoods Messrs. Lowe, Bevan have several good designs, characterised by simplicity of adjustment, with consequent ease of detachment. Instead of the usual screws, etc., they are fixed by a lever, which secures their instantaneous displacement, and thus facilitates bringing them into service during stormy times. Many other excellent motor fittings are also on view, including folding seats, luggage carriers, brackets, inside fittings for covered cars, and all the many devices required by motor-car body makers.

#### Touring Conveniences.

Messrs. J. B. BROOKS AND CO., LTD., are responsible for many effective improvements in motorists' tool kits and similar accessories for the storage of luggage, &c. Their circular bags to fit within the spare tyres, and so economise the available space, have been improved upon since their introduction a few seasons ago, and now have separate compartments, with two independent lids, giving access to the interior, thus rendering them more useful for carrying repair outfits, overalls, wraps, &c., and the score and more little things to add to the comfort of motorists. A new patent tyre wrapper is also shown, which fits the tyre without wrinkling, and excludes dust and damp. The tool and spares cabinet, previously described in the *M.C.J.*, is another attractive feature of the display. This is adapted for use on the footboard, along which, on opening, the trays extend, the front panel acting as a strut for their support. In motor tool kits a new feature has been introduced, two or three flaps keeping the tools in position, thus doing away with the loops for each separate device usually employed. An important section of the business of Messrs. J. B. Brooks and Co., Ltd., is that of the provision of touring requisites, and here the selection is made complete and indicative of ingenuity in design. The "Tourist Necessaire" is the counterpart of the dressing-case, providing a convenient receptacle for clock, maps, cigar-case, flask, brushes, and other necessary articles for which little provision is generally made. Luncheon and tea outfits, kit bags, &c., are comprehended within this section of the exhibit. No reference to the display would, however, be complete without mention of the tyres and bands. The latter envelope the walls of the tyre and can be vulcanised on to any covers. An important feature of their construction is the patent stud, with hardened steel inset head, which secures a hard wear-resisting surface, while providing an efficient preventive of skidding.

#### Non-Skids and Tyres.

The SAMSON LEATHER TREADS AND TYRE COMPANY, LTD., take advantage of the occasion to introduce the Wilkinson Duplex tyre, which has a lining of rubber vulcanised to the inner surface of the casing, thus leaving the canvas body embedded in rubber and sealed between two resilient bodies. The resiliency set up by the running of the tyre is jointly absorbed by the inner resilient section supporting the canvas casing. In addition to this acquisition of resiliency, retardation of the spread of moisture following a puncture is secured by the vulcanising of the rubber to the inner face of the casing. The Wilkinson "Duplex" tyre is made with either a round or square tread. At the stand will also be seen the Samson tread. The fact that this has been used in many recent speed competitions with remarkable success is naturally made much of by the makers, who recall the fact that the 200-h.p. Darracq car on which Mr. A. L. Guinness lowered the flying kilometre record at Dourdan had Samson non-skids fitted to the tyres on the driving wheels. The features of the device are well known, the chief points being that the band does not cover the whole of the rubber, so that the tyre does not lose its elasticity. A band of leather forming the actual tread is fastened to the leather cover by projecting rivets in rows of from two to five, according to the width of tread required. Between the tread and the pneumatic tyre is an extra strip of leather, which is vulcanised to the cover, thus affording protection from the ends of the rivets. The treads can be fixed to old or new covers, and the Samson type is certainly one of note.

#### Fire Extinguishers.

The new type of petrol fire extinguisher to be seen on some of the cars on the ground floor is the main exhibit at the stand of the VOLO COMPANY, LTD., in the gallery. This is the "New Era" extinguisher, adapted to the purpose of the touring and pleasure car. It is on identically the same principle as that applied in the case of motor-buses, several hundreds of which are now fitted with the appliance. The cylinder is made of rolled copper, tinned on the inside to prevent corrosion, and the device has been tested to a pressure of 350 lb. to the square inch. A stream of fire extinguishing chemicals can be thrown a distance of 40 to 50 ft., extinguishing inflammable materials that cannot be extinguished by water. The idea has also been incorporated in a new form of appliance for motor-boats.

#### The Autoclipse Lamp.

The "Autoclipse" motor lamps are shown by Messrs. GEORGE W. HOUK, LTD., of 7, Snow Hill, E.C., and the demonstrations of their merits are gaining them many advocates at the Show. In this lamp is a combination of the bright and diffused light necessary when travelling on country roads with a self-eclipsing mechanism that cuts off the reflecting power of the lamp and thus brings it within the compass of an adequate light for towns. This is no haphazard arrangement but a thoroughly well-devised effect based on a scientific system, so that either description of light can be obtained at will. Discs are used to prevent the long-distance rays being thrown into the reflector, and it is only necessary to interpose these between the burner and reflector to secure their complete elimination. The Autoclipse lamps are made in several sizes, ranging from Model A, with its projective power of 700 ft., to Model D, which is admirably adapted for small cars, and will project its light 480 ft. These lamps are all of good appearance, and their workmanship vies with the sound principles of design upon which they are based. Messrs. HOUK, LTD., also show a new speedometer, reference to which will be made on a later occasion.

(To be continued.)

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
87-88, Charing Cross Road, W.C.]

### FOREIGN-BUILT CARS IN ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—That England should eventually become the great manufacturing country of the world for the building of motor-cars is, I think, the wish of every Englishman, but I cannot see that this end will be attained any the quicker by endeavouring to persuade ourselves that we are now at the top and by being misled as to the true state of affairs. As the latest example I would like to quote from the speech of Mr. Manville to the Daimler shareholders at the meeting of the 8th inst., in which he stated that England's prosperity in the automobile world betokened the falling off by manufacturers in other countries. To quote Mr. Manville's words in addressing his shareholders :—"They should,

### INDUSTRIAL ALCOHOL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—At the lecture which was delivered recently at the Institution of Automobile Engineers, on "The Combustion of Hydro-Carbons," Professor Bone referred very encouragingly to the prospects of the early substitution of alcohol as a fuel for motor-cars.

This being a point upon which a good many present were greatly interested, a communication was addressed to Professor Bone on this subject, who supplemented his remarks as follows :—

"Motorists are quite right about the importance of the thorough investigation of alcohol as a fuel for internal combustion engines, and I feel convinced that it will soon come to the front by force of circumstances. On general grounds, as well as on the results of my own observations, I believe it will prove a good and economical fuel. The question is doubtless quite ripe for investigation."

So convinced is the professor of the future of alcohol, that probably very little pressure would persuade him to take up the subject in a systematic way, if he could be assured of proper support.

In order to realise in the near future the ideal of a home-produced fuel, there is no doubt motorists will have to rely a good deal, in the first instance, upon the investigations of chemists, and doubtless i

The French Reliability Trial of Heavy Vehicles for Military Purposes. (See page 836.)

in the first place, recollect that this country (i.e. England) is, of all Europe, the best market for automobiles, and that, as the trade with the continent is already visibly decreasing, a similar shrinkage in the profits of foreign automobile companies may be apprehended."

As showing how inaccurate and misleading this statement is, I beg to set out below the figures given at the meeting of the French Chambre Syndicale on the 5th inst. The figures refer to cars only and do not include parts. The value of chassis exported during the first nine months of each year was :—

1904	...	55,000,000 francs.
1905	...	75,000,000 "
1906	...	103,000,000 "

These figures refer to French exports alone, and do not include those from Italy, which, as is well known, amount to a very considerable sum and are enormous compared with the exports from that country two years ago; and there is certainly a very great increase in German exports. What useful purpose is served the British industry in making statements which are not accurate in fact? The true fact is that the demand for automobiles is increasing enormously, but so far from England alone prospering, all the manufacturers—at home and abroad—are benefiting thereby.—Yours truly,

CHARLES JARROTT.

motor manufacturers determined to support the valuable work which has been done by Dr. Ormandy and Professor Bone, so much interest would be created amongst the scientific body of chemists generally, that very much valuable data would be available at an early date.—Yours truly,

RADFORD COOKE.

### VALVE POSITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see that Mr. A. E. S. Craig refers to the alleged vacuum in the cylinder of the four-stroke engine as generally used on motor vehicles immediately the exhaust valve closes. I do not think that this is generally maintained now unless perhaps when the engine is very much throttled down. Under ordinary circumstances there is a considerable pressure in the cylinder when the exhaust stroke is completed, and, in fact, I have found a pressure of as much as two atmospheres then. I have experimented a good deal with exhaust valves and ports with a view to getting a perfect exhaust, and learnt enough in consequence to see how very crude our present system is. I hope Mr. Craig will not mind if I venture to disagree with his remarks to the effect that the flow of the gas along the induction pipe is not ultimately interfered with by the shutting of the inlet valve owing to its having

the three strokes of the piston, during which it recovers from its state of agitation. I have carried out some highly interesting experiments showing that at high speeds there is a great disturbance owing to this cause, and I maintain that we do not and never can have a compression of four atmospheres in these engines under the present conditions.—Yours truly,

A. J. MCKINNEY.

#### FOUR v. SIX CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am surprised to see my old friend Mr. Charles Jarrott writing on the respective merits of six v. four cylinders, and I do not propose to argue the matter with him. The fact that seventy-eight of the leading manufacturers of the world have copied the six-cylinder principle is quite sufficient for me, and, with all due deference to Mr. Jarrott's opinion, I think the six-cylinder type will become absolutely universal for all powerful cars, and I only wish, for Mr. Jarrott's own sake, that he had appreciated this previously, so that he might not have to bolster up powerful four-cylinder cars, which I could understand if he was interested in a tyre factory and wished to use up as many tyres as possible.

Mr. Jarrott has previously given me advice that good motor-cars cannot be manufactured in Great Britain, and on this point I think he is hopelessly wrong. He has also previously written and said that powerful cars cannot be satisfactorily built with a live axle, and on this point I consider he is utterly and hopelessly wrong, as for the last two years nearly every important big road race has been won upon cars fitted with a live axle and direct drive as introduced by Mr. Napier in 1902. My opinion of Mr. Jarrott as a prophet is not nearly so good as my

A French Motor-Bus Service.—A Snapshot at Honfleur.

opinion is of him as a sharp business man, who is doing his best to hold up the powerful four-cylinder trade in its declining years. My best advice to him is to hurry up and change and do not waste time in trying to decry the six-cylinder principle, which is now an assured success. A visit to the Napier works at Acton would no doubt somewhat surprise him, where he could see some 1,200 people engaged in making Napier six-cylinder motor-cars.—Yours truly,

S. F. EDGE.

#### BRITISH CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Truly the ways of advertisers are passing strange. I have seen Worthington's motor beer bottle—a clever idea; but why a foreign chassis to help to swell the sale of British beer?

I, personally, have had an Argyll, and have now a Wolseley and 36-h.p. Daimler, and as regards value for price and reliability I would not exchange them for any other. Surely Mr. Alec Govan's reminder that every car built here in this country keeps three men and families for a year should influence wealthy firms, especially one that sells such an essentially English article as Worthington's pale ale, to buy an English car.—Yours truly,

O. 80.

#### PREFERENTIAL TAXATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There must have been some very special pleading at the meeting of motorists last week when a resolution was adopted in favour of differential treatment of the cars of medical men. Why they should be so favoured I cannot see, for the advantage of the automobile is already great to this body of men.

By the use of the motor-car the doctor will either be able to see more patients, and thus increase his revenue, or he will have more leisure, which should be welcomed in these days of much hurry and

scurry. Why, then, should the medical profession seek to avoid the payment of taxes which should, if they are to be equitable and just, fall upon all alike? I trust this spirit of suggesting different treatment for different classes of men will soon be eradicated. Should it develop to any degree, it can only disturb the harmony of the present position and divide motorists into camps.—Yours truly,

TAX, AND BE TAXED.

#### COVERED BODIES FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see in the Commemoration Number of the *M.C.J.* that you have shown some of the old type of cars. I should like to call to your notice that I was the first to design a motor brougham body with the side entrance. I registered it as far back as 1897, and I was paid royalty on it. The first one was made by Messrs. Offord and Sons, to whom I was and am now manager. I fitted it on an old 7-h.p. Panhard chassis, which I had to lengthen 14 in. to get the wheel base. When completed it was sent over to Paris to be copied.—Yours truly,

W. T. CROFT.

#### PLUG TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Lately the spark in my plugs has commenced to jump over the porcelain to the lower part of the plug. This more often occurs when the engine is running slowly. I should be obliged if you or any reader of the *M.C.J.* could tell me the cause.—Yours truly,

PLUG.

[The cause of the trouble is that the resistance of the gap between the sparking points has become greater, and the resistance between the metallic parts at each end of the porcelain has become less through moisture or some similar cause. Consequently the current is able to pass across either path with the same facility, and does so intermittently according to the actual conditions at the moment. As this occurs more often when running slowly, it shows that the insulation across the porcelain is so poor that the spark takes that route directly the resistance between the sparking points is increased by reduction of heat in the cylinders. To remedy this change the plugs, more especially at this time of the year, when connections are likely to become damp.]

#### SPEED INDICATORS AND THEIR OPERATING MECHANISM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a combined speed indicator and distance recorder on my car, which is driven by an enclosed flexible shaft from gears fitted to one of the front-wheel hubs, the indicator being located on the dashboard. Several times within the past year the gears have given out through tooth breakage, distortion and wear. I should be glad if any users of these indicators would state whether they have had the same experience with the gears as I have and the steps they have taken to overcome the difficulty.—Yours truly,

BROWN.

#### OVERHEATING TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should feel greatly obliged if any readers of the *M.C.J.* could give me any reason for the overheating of my car, a 9-h.p. Clement. The water boils after a few miles. The connections are all clear and new, the water tank clean, the circulation in the radiator pipes quite clear, and the pump acts. I should be very grateful for any hints as to how to keep the water cool. Would an induction valve on the induction pipe be of any use? There is not sufficient room for a fan.—Yours truly,

E. B.

[This seems to be another of the many troubles that may be remedied by dismantling the cylinders and clearing out the carbon deposit in the heads, the cause of which has been given many times. We doubt whether an induction valve would be of any great advantage.]

WE have been asked for the name of the publisher of a summary of the Motor Car Act of 1903, with the various Local Government Board regulations, by Captain Wright.

MESSRS. FRISWELL (1906), LTD., write to say that the advertisements now appearing in certain papers relative to Friswell, Ltd., have reference only to any creditors of that concern who may not have sent in their accounts to the company before its purchase by themselves. The announcement has no reference to Friswell (1903), Ltd.

"E. B." writes:—"I shall be glad if any of your readers will inform me who are the firms in England or United States who manufacture epicyclic or crypto gears, three speeds and reverse."

GLASS SCREENS.—"D. L." writes:—"Can any reader of the *M.C.J.* inform me what is the best preparation to use on 'Glass Screens' in a drizzly rain, as I find it very misleading? I have tried some solutions, but not met with any success."

MR. C. HAYES, 3, Villas Road, Plumstead, S.E., would be pleased to hear from any reader finding a large Milnes-Daimler wheel cap, which was lost between Woolwich and Islington on the evening of the 19th inst.

## THE MOTOR UNION.

## TENTH ANNIVERSARY OF THE 1896 ACT.

ON Wednesday of last week the Motor Union held an important dinner at the Hotel Great Central, Marylebone, when the Hon. A. Stanley, M.P., presided over a large attendance, which included the representatives of most of the provincial clubs affiliated with the Union as well as many public men, including Major Atcherley, chief constable of Shropshire, Col. Bosworth, of the Automobile Association, Sir Alexander Bruce, Sir A. Conan Doyle, Mr. H. W. Porter, M.P., Mr. E. G. Hemmerde, M.P., Sir A. Henderson, Bart., Sir E. R. Henry, Chief Commissioner of the Metropolitan Police, Professor Herkomer, R.A., Mr. Ballin Hinde, treasurer of the Motor Union, Major-General Hutchinson, Major F. L. Lloyd, Lord Montagu, Sir Henry Norman, M.P., Mr. C. D. Rose, M.P., Mr. W. Runciman, M.P., Earl Russell, and Mr. Rees Jeffreys (secretary).

The Chairman gave the toast of "The King and the Royal Family," and then Mr. E. G. Hemmerde, M.P., proposed "Motorism and the Motor Union of Great Britain and Ireland." He might, he said, a week before, have come to them and urged them not to break the law, but something had happened which would prevent his doing so. He might be charged with obstructing the police, if he were one of a society that urged them not to break the law. That was how he read Mr. Justice Darling's dictum. The minister might tell his flock not to break the law, but if he was a member of a missionary society banded together to prevent people from breaking the law, then Mr. Justice Darling would suggest that he might well come within the meshes of the law by defrauding the police of their lawful prey. One thing he had noticed about the Motor Union, that there were many members of it who had the courage to fight out to the end cases which ought to be fought out for the benefit of the movement in which they were interested. They had to face the same prejudice as every new instrument of progress had since the world began. Yesterday it was bicycles, to-day it was motorists.

The Hon. Arthur Stanley, M.P., responded. He said he need not say anything about the past of motoring, when they saw that three speakers on the toast list were pioneers of the movement. Of the efforts of Mr. Roger Wallace, the Club's first chairman, in the early days of motoring, it was impossible to speak too warmly. Then they had Mr. Claude Johnson, the first secretary of the Club, and last, but not least, they had Lord Montagu. As for the future, that was very well pictured on the front page of the programme, for which they were indebted to Professor Herkomer. He thought it would be difficult for anyone who had not followed it closely to realise the amount of work that had to be displayed by a body such as the Motor Union. He wanted to emphasise especially the unanimity and absolute harmony with which this great body, which had many divergent interests, had worked. He believed that this was due to one sole cause, which was that they were working with a single eye for the advancement of motoring, not only for the motor industry, but for the convenience and social well-being of the people of this country.

Sir A. Conan Doyle proposed the toast of "The Public Authorities of the United Kingdom." There was one thing about that toast that struck his eye the moment he looked at it in print, and that was that upon this occasion the police had got to respond to him. Legislators had to hold the scales between the fanatic on the one side and the fanatic on the other side, and to strike the balance. Looking back and remembering how they had started from the red flag stage, how they had reached the twelve-mile stage, and how they had developed into the twenty-mile stage, and knew they were on the threshold of a further development, he thought that they had a very great deal for which they might thank their legislators. The spirit of our law was to preserve the lives of the citizens. Where there was no danger there was no protection, and there was no danger where no man was in sight upon a country road with no crossings. Yet that was where the police in many cases chose to lay their traps. It was an insult to common sense to pretend that they would acquiesce in such a state of things, or that they would recognise it as other than a technical infringement of a law, which might bring profit to those who enforced it. He was sure that this was a passing phase. As a Surrey man, he would be glad to see the millennium arrive, when the Surrey police would climb out of that modest seclusion in which they had hitherto dwelt, would come out from behind the ditches and hedges, and would again resume that great duty for which they were qualified. In that very county within the last eighteen months there had been two murders, the perpetrators of which were now walking about unarrested.

Mr. Walter Runciman, M.P., Parliamentary Secretary to the Local Government Board, replying for the Houses of Parliament, said that he was grateful to Sir Arthur Conan Doyle for treating the Legislature more kindly than he had treated the police. He had a hundred or more suggestions which he could read to them. It had been suggested that cars should have a clearance of not less than 18 in. to prevent danger to people under the cars, which was a position, he understood, sometimes occupied by the general public and sometimes by motorists themselves. Innumerable suggestions had reached them as to emergency brakes. It had been suggested that all motor-cars should be fitted with cow-catchers. Lastly, it was urged that all horn-

blowing should be moderated on Sundays outside places of worship, and that all vehicular traffic should pass these holy places at walking pace. All sorts of conditions and punishments had been planned out by their correspondents, varying from hanging, drawing, and quartering anybody who drove a motor-car to the imprisonment of the car itself, should it unfortunately break the regulations. The Local Government Board had also to deal with the extremely difficult problem of the taxation of motor-cars. So far as they had gone on the latter subject, they had decided that they could not create a good and just scale of taxation on a horse-power basis. On the subject of taxation, he would only add that if they would provide the Local Government Board with a sensible scheme, he would be very glad to name the amount of the tax.

Sir Edward Henry congratulated the Motor Union upon the progress which automobilism had made in this country. It was a matter for great gratification that the large increase in the number of cars had not been accompanied by an increase in the number of instances in which the police had felt constrained to intervene, in order to secure observance of the law. There had not only been no proportionate increase, but, so far as he knew, no increase at all. That was not due to any cessation of vigilance on the part of the executive, but to the wider dissemination amongst motorists themselves of the feeling that he who drove a car should drive it with due regard to the safety, the convenience, and even to what he might deem the unreasonable prejudices of those whom he might encounter on the road.

Mr. G. L. Gomme, Clerk to the London County Council, responding for that body, said he would like to say this for the L.C.C., that at a time in the early days, when all sorts of ideas were in the air as to the limit of speed, the Council declined to put that limit on. Looking at the financial aspect of motoring, he was not sure whether they were not landing themselves in a considerable difficulty, because, if they were to attach the whole of the moneys which resulted from car taxation to the upkeep of the road, were not they in the danger

Instructing Italian Soldiers in the Art of Motor Driving.

of making that taxation the sole fund from which they could get the upkeep of the road?

Mr. W. J. Taylor, M.I.C.E., Hants, County Surveyor and President of the County Surveyors' Society, responding for the Highway Authorities, reminded them that there were in England and Wales 1,900 separate and independent road authorities, which had at least 1,900 different ways of attempting to do the same thing.

Mr. C. H. Dodd, vice-chairman of the Union, proposed the toast of "The A.C.G.B.I. and the affiliated clubs." Mr. C. D. Rose, M.P., responding. Major J. A. Cole, J.P., Chairman of the Lincolnshire A.C., responding also to the toast, said those who had come from distant parts of the country must have heard with great satisfaction the declaration of Mr. Runciman that they need not fear horse-power taxation in the future, and he thought they ought to try to avoid mares' nests or horse-power nests.

Mr. Claude Johnson, in proposing the toast of "The Pioneers of the Movement," expressed the great debt of gratitude they owed to those who pushed forward the movement in its early days. Mr. Roger Wallace, K.C., responded.

Lord Montagu of Beaulieu had great pleasure in proposing the toast of the most popular man in the room. The excellent work their Chairman had done in connection with the Automobile Club, the Motor Union, and the general movement, entitled him to be ranked amongst one of the best leaders they had ever had. The Chairman thanked them for the many kindnesses they had done him, and the almost excessive warmth of their greeting, especially as the toast had led to the almost unprecedented scene of the Chief Commissioner of Police indulging in what he could only describe as a disorderly proceeding. He knew that in the reception they had given to the toast they would include those sitting on the Union Committee, and the Chairmen of the Committees, and their able and energetic secretary, Mr. Rees Jeffreys.

## CLUBS AND ASSOCIATIONS.

### THE MOTOR UNION.

THE November meeting of the General Committee of the Motor Union was held at the Hotel Great Central, Marylebone, on the 15th inst.

The Hon. Arthur Stanley, M.P., presided, and there was a large attendance of delegates from all parts of the country. Altogether thirty-five provincial clubs were represented, in addition to representatives from the A.C.G.B.I. and of the individual members.

Among the business occupying the attention of the committee were a number of applications for legal assistance from members, and it was resolved in the case of two members—Captain Farrer and Captain Arthur—to make contributions from the "Defence Fund" towards the costs of appeals against the convictions of the magistrates, which convictions, in the opinion of the committee, were against the weight of evidence. Grants were given in other cases, and altogether twenty-five applications were dealt with.

It was also resolved to vote the sum of twenty guineas to the Motor Van, Wagon and Omnibus Users' Association for the purpose of testing the legality of certain notices which had been placed upon a large number of bridges in Cambridgeshire by the Great Eastern Railway Company, closing the bridges to heavy motor traffic.

It was also resolved that signs and notices indicating special circumstances, and bearing the name of the Motor Union, are desirable, the signs to be applied by the Motor Union at a price, on application, to any private persons or local authorities. It is intended that these special signs shall be in addition to, and not in substitution for, the ordinary warnings which County Councils are required to erect under the Act.

Sir A. M. Watkin, J.P., D.L., of Folkestone, Mr. T. D. Grimk-Drayton, J.P., of Newent, Glos., and Mr. N. A. Heywood, of Wickham Market, were elected life members, and it was reported that the Union now included eighty-two clubs, and that its aggregate membership was upwards of 14,000.

### HARROGATE.

At the annual dinner of the Harrogate and District Automobile Club the president (Dr. Ozanne) was in the chair, and the attendance also included the Mayor (Alderman James Chippindale), Mr. Chas. Jarrott (London), Mr. E. H. Hepper (chairman of Yorkshire Automobile Club), Mr. C. P. Wilson (secretary of Yorkshire Automobile Club), Supt. Keel, Dr. Holroyd (hon. treasurer of the H. and D. A.C.), Colonel Pierce, and a number of local motorists.

After the loyal toasts Dr. Holroyd gave the "Pioneers of Motoring," to which Mr. C. Jarrott replied. The latter said that automobilism was a great gift and privilege and enabled them to view the land they loved so much. He had been called a pioneer, but it was no great honour ten years ago, for they were often looked upon as a greasy sort of lunatic travelling on a sort of infernal machine that might blow up at any moment. Of course by some they were looked upon as a sort of brave individual. In those days motoring was not such an enjoyable experience as some might imagine at the present time.

Mr. A. Gask submitted the toast of "The Mayor and Corporation of Harrogate," and in doing so said it might perhaps come as a surprise to those members of the Corporation who were honouring them by their presence that evening to know that the members of the Harrogate and District Automobile Club were grateful and appreciated the services they had rendered to the town.

The Mayor, in responding, said that he was not particular how much he was criticised so long as he knew he was trying to do his duty honestly and fairly. He then referred to the trial of Akonia on the road on the occasion of the meeting of the Motor Union in Harrogate nearly two years ago. It was a success, had been used ever since, and motorists could now pass through Harrogate without disturbing the inhabitants and visitors as they used to do. Now it was a pleasure to live on the sides of main roads, where before it was almost miserable on account of dust blowing into their houses; so that the inhabitants of Harrogate had derived some benefit from the motorist "kicking up a dust."

Mr. T. S. Watney (Harrogate) proposed "The Motor Union and Affiliated Clubs," and referred at some length to the advantages of the Motor Union.

Mr. E. H. Hepper (Leeds, chairman of the Yorkshire Automobile Club), in response, remarked that the Motor Union had been of great benefit to Harrogate. With respect to the speed limit in certain streets in the town, Mr. Hepper said that no sane motorist would think of going more than ten or twelve miles an hour in those streets. If they got a speed limit throughout the town it would have been fatal to Harrogate. Respecting the dust nuisance, he was in a position to state that the reports of a number of surveyors in the West Riding were to the effect

that some form of tar macadam was the remedy, and the cost of that system was no more than the cost of the present method.

The toast of "The President" was enthusiastically received, and his retrospective response brought the speechmaking to a close.

LORD INVERCLYDE has been elected president, and Lord Angus Kennedy vice-president, of the British Motor Boat Club.

A PRESENTATION will be made to Mr. A. Birtwistle, hon. secretary by the committee of the North-East Lancashire A.C., at a special meeting and concert on the 27th inst.

THE Aero Club has removed from 110 to 166, Piccadilly, W.

PROFESSOR VIVIAN B. LEWES, of the Royal Naval College, Greenwich, has consented to read a paper before the members of the Motor Yacht Club after Christmas on "Chemical Problems of the Automobile Industry," having especial regard to the use of petrol *versus* alcohol in motor-boats.

### PUBLIC MOTOR VEHICLE REGULATIONS.

PROPRIETORS, before entering into contracts for new types of motor hackney carriages, would do well to send the drawings to New Scotland Yard for approval as to type, as well as study carefully the conditions for obtaining a certificate of fitness for motor hackney carriages which have just been promulgated under date November 15, 1906, and of which the following are of general interest:—

Hackney carriages propelled by mechanical means, and subject to the Light Locomotives Act (59 and 60 Vict., cap. 36) and Motor Car Act (3 Edw. VII., cap. 36) must comply with the requirements of those or any subsequent Acts, and of the Orders of the Local Government Board made in pursuance thereof.

The following measurements and requirements for a hackney carriage should be adhered to:—

Chassis, wheel-base.—Should be so proportioned that skidding or other improper movements shall be as far as possible avoided.

Chassis, springs.—The springs must be properly hung, of sufficient strength and flexibility to meet all purposes which may be required of them. Those springs carrying the load must be attached to, or bear upon, the back axle, as near to the wheels as possible, the distance between the outsides of the rear springs shall not be less than 40 in. The front springs must be as wide apart as possible, but not less than 26 in. from outside to outside.

Chassis, wheel track.—Centre of must not be less than 4 ft. 4 in., and in no case must the front be less than the rear.

Body, hansom pattern.—Inside, from the top of seat cushions to the roof at the lowest part, or, where the front window frames fold up toward the roof to the lowest part of the frame, must not be less than 40 in. The width must not be less than 40 in. From the back squab to the nearest point of door pillars must not be less than 26 in., and for knee space not less than 28 in.

Body, landaulet or brougham pattern.—Inside, from the top of seat cushions to the roof at the lowest part, must not be less than 40 in. Between the hinge pillars or shutting pillars the width must not be less than 40 in. The width of the door must not be less than 21 in.; where the carriage is provided with front and back seats the measurement between the front edges of cushions must not be less than 19 in.

There must be a handrail, commode rail, or other suitable means to assist passengers entering and alighting, and it must be properly and rigidly fixed.

The total overall length of the chassis and body must in no case exceed 13 ft., nor the extreme breadth be greater than 5 ft. 9 in.

Each carriage must be fitted with at least two independent brakes of sufficient strength so that either of them shall be capable of stopping and holding the carriage under all conditions. They must also, where necessary, be fitted with a compensating device.

Each car must be capable of being readily steered and able to turn on each lock, and proceed in a contrary direction within a roadway not more than 25 ft. wide from kerb to kerb.

The machinery should be so constructed that no undue noise or vibration is caused, and the maintenance of the carriage in this condition will be strictly enforced.

The machinery must be so constructed or placed that oil from the bearings shall not be allowed to drop on to the roadway. When trays are fixed to prevent this they must have suitable webs for retaining the oil when ascending or descending hills, or be otherwise suitably constructed with that object, and oil must be cleaned out frequently, and not allowed to accumulate from day to day.

Every vehicle must be provided with, and maintain in use at all times, an approved means of preventing or limiting side-slip.

Straps with holes must be placed on the window frames (where considered necessary), and metal or bone knobs must be fixed inside the carriage, to enable the windows to be partially closed.

Carriages, the floors of which are above 18 in. from the ground, must have suitable steps, and suitable commode rails for the convenience of passengers.

ON Monday the Home Secretary (Mr. Gladstone) who was accompanied by Mr. Herbert Samuel, M.P., the Under-Secretary, and Sir Edward Henry, the Commissioner of the Metropolitan Police, received a deputation on the subject of the licensing of motor-omnibuses.

Lord Montagu urged that more latitude should be given to 'buses ordered before the new regulations came into force.

Mr. Straker stated that over ninety motor-omnibuses made by his firm were awaiting licences, and over 150 were wholly or partially manufactured, all of which would have passed the necessary tests six months ago. Mr. Duff spoke as to his company having forty 'buses ready awaiting licences. Mr. Tilling appealed to the Home Secretary to consider the case of the smaller 'bus-owners who had embarked all their capital in the new vehicles.

In reply, Mr. Gladstone pointed out that Sir Edward Henry and the Home Office had to consider the public point of view. The great number of passengers already carried by motor-'buses was proof of their public utility. He quite recognised that the views put before him were legitimate, and the deputation might be assured that the interests of the manufacturers would continue to be considered as far as was consistent with duty to the public.

### NEW COMPANIES REGISTERED.

**CRAVEN AUTOMOBILE COMPANY.**—Capital, £5,000, to take over the business of automobile engineers and dealers carried on by Mr. W. C. Slingsby, at 20, High Street, Skipton, Yorkshire, as the Craven Auto-

## CASES UNDER THE MOTOR-CAR ACT.

### SECTIONS 1 and 2.—RECKLESS DRIVING AND REGISTRATION.

Mr. Wagstaffe and Mr. Robert Taig, a Dumbartonshire motor-car manufacturer, have been summoned at Birkdale for driving an unregistered car on October 30th and 31st. Superintendent Jervis said that Taig sometime ago sold a car to Mr. Parkes, of Birmingham, which was registered at Glasgow "G1,017." At Birmingham Mr. Parkes had it registered in his own name. Afterwards Taig sold another car to Mr. Wagstaffe and placed the number G 1,017 on this car, which was the same as on the car that went to Birmingham. This was on October 16th. For the defence Taig said that on October 16th he wrote to the registrar at Glasgow asking him to transfer the number. The letter never reached its destination. It was posted at a Welsh post-office. Taig was fined 20s. and costs and Wagstaffe 10s. and costs. The former was subsequently summoned for driving to the danger of the public on November 1st in Liverpool Road, Birkdale. A fine of 20s. and costs was imposed. A further case against Taig for not being able to produce his licence on this occasion was withdrawn on payment of costs.

### SECTION 9.—THE SPEED LIMIT.

Mr. Henry Richard Pope has been summoned at the Battle Petty Sessions to answer a charge of driving a motor-car at an illegal rate at Lunsford Cross, Ninfield, on July 8th. A letter was put in stating that

Motor Touring on the Continent.—At the Swiss-Italian Frontier at Pontesba.

mobile Company. First directors, Messrs. R. F. Roundell, W. C. Slingsby, H. Priestman, W. E. Slingsby, and J. L. Kidd. 20, High Street, Skipton, Yorkshire.

**MANCHESTER AUTO-CYCLE COMPANY.**—Capital, £1,500. First directors, Messrs. L. Stones and W. Stones. 65, Great Jackson Street, Hulme, Manchester.

**HILLS-MARTINI.**—Capital, £25,000, to adopt an agreement with Mr. A. C. Hills, for the acquisition of the benefit of an agency contract made between the Martini Automobile Company, Ltd., and the said A. C. Hills, and to act as sole agents in the United Kingdom and British Colonies and Dependencies (except Canada) for the motor-cars and chassis manufactured and sold by the said Martini Automobile Company, Ltd. The first directors are, Mr. A. C. Hills (managing director), Sir R. B. N. Gunter, Bart., Mr. R. M. Logan, and Mr. S. Cary. 13, Duke Street, Aldelphi, W.C.

**ARGYLLS, LIVERPOOL.**—Capital, £10,000. First directors, Messrs. H. J. Hamilton (chairman), A. Govan, and W. H. Buxton. 27, Leese Street, Liverpool.

**CALTHORPE MOTOR COMPANY.**—Capital, £5,000. To acquire the business of motor-car manufacturers carried on by G. W. Hands, Agnes Stamps, and T. R. Fletcher at 16, Barn Street, Birmingham, as the Calthorpe Motor Company. First directors, Messrs. G. W. Hands, T. R. Fletcher, and A. L. Stamps. Cherrywood Road, Bordesley Green, Birmingham.

defendant had had his licence suspended for another case, and was now in Turin. P.S. Waghorn spoke to timing defendant over a measured furlong, which he covered in sixteen seconds, equivalent to twenty-eight miles per hour. Witness gave a signal, and P.C. Duly stepped out of the hedge and stopped defendant, who was served with a written notice of the intended prosecution. P.S. Roberts, of Chichester, proved three recent convictions, defendant having been fined £20 at Beaconsfield Petty Sessions only two months ago, and had his licence suspended for twelve months. A fine of £20 and £2 6s. 6d. costs was imposed.

### SECTION 1.—RECKLESS DRIVING.

On Tuesday, at the Hove County Bench, Frederick Earle, chauffeur, of Hampstead, was summoned for driving a motor-car on the highway in a manner dangerous to the public at Patcham on September 30th. The prosecuting solicitor detailed the way in which the defendant had driven a motor-car and knocked down a cyclist who happened to be in his way. After hearing evidence the Bench decided to convict. Two previous convictions were reported and he was now fined £10 and £6 special costs. In addition, defendant's present licence would be suspended, and he would be deprived from obtaining another licence for four months after the expiration of the present licence.

A motor-car mishap, which occurred in Scotland in September of last year, near Dalwhinnie, on the road from Pitlochry to Kingussie, was the subject of an action heard in London on Tuesday, in which Mr.

Charles B. Iemay was plaintiff, and Mr. and Mrs. Edward Manville defendants. There were two ladies and a chauffeur in each car. Mrs. Manville was driving the one, her counsel stating that she had had great experience, and had taken part with success in the competitions for the Herkomer international trophy. It was alleged that Mrs. Manville drove so that her canopy caught the hood of plaintiff's car, with the result that the hinder part of the body was torn off the chassis. The jury found for the plaintiff, for whom judgment was accordingly given for £128 and costs.

### ROAD REPORTS.

**SOUTH-EAST LANCASHIRE.**—The motor-waggon traffic in South-east Lancashire has increased to such an extent, that several of the district councils are considering the question of applying to the County Council for increased grants for the maintenance of main roads. The Whitworth District Council state that, although only seven months of the financial year have gone, they have already spent on the roads more than has been allowed by the county authority, and the remainder will have to come out of the local rates.

**KNIGHTSBRIDGE.**—The Knightsbridge road has been undergoing repairs, as many visitors to the motor show in the vicinity have discovered.

**SIGNS IN ESSEX.**—A correspondent calls attention to the sign-posts on Essex roads as follows:—Suppose anyone not perfectly acquainted with the road wishes to get from Chelmsford to Harlow. After some enquiry in the town, he gets started off on the right road and continues for a mile or two, and then the trouble begins. He must stop at every turning and ask the way, for not a single sign-post will he see with "Harlow" on it till he is nearly at his journey's end. Then, on his return journey, at a turning a short distance from Harlow, a conspicuous post points one way to "Matching," the other way, at right angles, to "Ongar and Chelmsford." He naturally takes this, and will continue on for many miles, and just as he thinks he must be about half-way he is confronted with a post, "14 miles to Chelmsford." He has already come at least half that distance, and the two towns cannot be more than 17 miles apart.

**ABERDEEN.**—Road authorities throughout the country are watching with interest the action which the Aberdeen District Committee of the Aberdeen County Council is bringing against the Great North of Scotland Railway Company for damages to the road caused by the defendant company's motor-buses.

### ACCIDENT TO A MOTOR-CYCLIST.

At Wandsworth, an inquest has been held on the body of Oliver Gold Duncan, a dental surgeon, of 27, Eccleston Street, Fimlico, who was killed as the result of a collision in Wildcroft Road, Putney Heath. Deceased and a friend were riding motor-cycles over Putney Heath when a horse ridden by a young man named James Thornton, Wimbledon, came into collision with the machine ridden by the deceased. Both horseman and cyclist were thrown, the latter sustaining a fractured skull and dying in three minutes. Mr. Thomson was also injured, and is suffering from concussion of the brain. The jury returned a verdict that deceased died from the injuries caused by the collision, but that there was not sufficient evidence to show whether there was culpable negligence on the part of the rider of the horse.

### PUBLIC MOTOR SERVICES.

**DAMAGES** to the extent of £70 have been awarded in the City of London Court to Mr. Ralph S. Morrish against the London General Omnibus Company, from one of whose motor-buses plaintiff fell when it skidded in the Strand. The company intend to appeal. At Clerkenwell County Court Richard Ashton has obtained a verdict and judgment for £75 against the Motor Omnibus Company, Ltd., for injuries received through one of the defendant company's buses skidding and knocking him down as he walked along the footpath.

**THE Isle of Wight Express Company** intend to run a service of motor-cars between the Town Hall, Ryde and Oakfield every Saturday at cheap fares.

At the conference of the Motor Union held in London last week, the following resolution was adopted, on the motion of Dr. Hele-Shaw:—That the refusal of a local authority in the provinces to licence motor vehicles for public services or the imposition by such authority of impracticable conditions shall be subject to an appeal to the Local Government Board.

The strike of London motor busmen has come to an end.

### LIGHTS ON VEHICLES.

**THE Knutsford magistrates** have held that it is obligatory for there to be lights on both vehicles when one is being towed by another at night. On the night of Sunday, October 14, Mr. Geoffrey Boote, an Altrincham engineer, drove his motor-car into a dogcart that was tied behind a trap driven by William Green, of the Golden Lion, Knutsford. He was thrown out of the car, and one of his ribs was broken, and the

car was considerably damaged. He saw no light on either vehicle, but Green, in his defence to a summons for driving a trap without a light, was able to show that the first one carried a light. The magistrates said that one light would not do for the two vehicles, and imposed a fine of 5s. and ordered the defendant to pay 23s. 6d. costs.

### MOTOR-CAR TRACKS AS EVIDENCE.

A GRAPHIC description of a collision between a motor-car and a dray was given before Judge Moss at Llangollen on Monday, when Messrs. Drew, mineral water manufacturers, of Oswestry, sought to recover £18 from Mr. Smith, of Well Springs, Bradford, and Mr. Francis Horner, a solicitor, of Bradford, for injuries caused to a horse. The defendants counter-claimed for £14, damage to a motor-car. It was stated that the motor-car came round the corner on its wrong side and dashed into the dray, battering the lamps. Dr. Helme, who came upon the scene after the accident, described in detail the record left by the car-wheels and dray-wheels on the muddy road. These tracks, he said, showed beyond shadow of doubt to him that the motor was on its right side and the dray on the wrong side at the time of the collision. His Honour gave judgment for Messrs. Drew for £10, with costs.

### POLICE TRAPS.

ON Saturday, at the stand of the Automobile Association, a police trap in Holland Road, Kensington, was notified to visitors. The Association map indicating police traps, &c., is a subject of much interest.

**MR. HANS RENOLD**, the head of the Manchester chain-making firm which bears his name, has been presented by a number of his employees with his portrait in oils. The painting is by Mr. T. C. Dugdale, a Manchester artist, and the inscription on the frame records that the presentation is "to commemorate October 16th, 1906." Three years ago, when the business was converted into a private limited liability company, Mr. Renold distributed a number of shares amongst his employees, the only condition being that if during the ensuing three years any employee left the concern he should hand back his shares. The three years expired on October 16th, and the scrip was handed unconditionally to the fortunate holders; and it was to commemorate the occasion that the presentation was made.

Two new companies have been formed to handle the Argyll cars in the Liverpool and Manchester districts. In the former city Mr. H. James Hamilton has established Argylls (Liverpool), Ltd., who will occupy the premises in Leese Street lately tenanted by the Road Carrying Company. Argylls (Manchester), Ltd., has been formed by Mr. R. H. Carlisle and Mr. T. Hooydonk to handle these British cars in Cottonopolis. Extensive garage accommodation and repair shops will be established in Deansgate.

### TO CORRESPONDENTS.

*All communications intended for insertion in this Journal or relating to editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

*The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.*

*The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.*

*To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.*

*Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case; otherwise no liability will be accepted.*

*The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.*

## COMMENTS.

IF financial incentive be worth anything the battle of the airships is almost as good as won; for liberal patrons of aerial locomotion have been most generous in their offers of rewards to the successful air-voyager from London to Manchester. This outburst of interest has practically synchronised with the annual dinner of the Aero Club, which took place a few evenings ago at the Carlton Hotel, London, when the usual influential and fashionable gathering assembled to discourse of things that are not earthly. Mr. Roger Wallace, K.C., presided, and in responding to the toast of the Aero Club, proposed by Lord Northcliffe, observed that future developments would be in the sphere of the aeroplane, and it appeared to him that the secret lay in the question of materials. Lord Montagu's contribution to the interesting series of speeches was in optimistic vein. He did not believe that they should look for the solution of the problem merely in the decrease of weight. The question consisted in securing a more powerful machine than was now available. Already M. Santos Dumont had an engine which could, roughly, produce 1-h.p. for every 2 lb. of weight, but it was with the more powerful engine, rather than the lighter engine, that the future lay. Prizes to the aggregate value of over £17,000 now await the man who successfully negotiates the air.

### Business at the Show.

AMONG the many opinions expressed with regard to the recent show at Olympia, that of the accurate and observant correspondent of the "Morning Post" seems to have accorded well with the general experience when he wrote that "with the exception of half-a-dozen instances, the orders that have been booked have been somewhat of a disappointment to the exhibitors." Of course, those firms which, for one reason and another, had come prominently before the public just before the Show did well on the wave of publicity which would have carried them forward in any case. But those firms and agents who appeal to the buyers of cars are realising that the spring is, after all, the season when prospective motorists are most easy to convert into actual possessors of cars. Hence the general lack of orders and the meagre results that seem to have attended the presence of many firms not only on the ground floor but in the Gallery as well.

### Laying Dust.

AFTER due consideration the Roads Improvement Association has undertaken the conduct of a tar spraying competition, which should excite the interest of local authorities throughout the country, as well as of motorists and other victims of dusty roads. The efficiency of the devices will be regarded from various points of view, one of which is that they should be capable of being worked by the ordinary road labourers without skilled attendance. Other things being equal, the advantage will be with the machine which can move most rapidly, which consumes the least tar, which requires no skilled attendance,

which can use the tar cold instead of hot, which requires refilling less frequently, and other similar points. The first prize will be an award of £100 and a gold medal, the second distinction consisting of a prize of 50 guineas and a silver medal. It is to be hoped that the competition will attract a large entry, and that it will prove the beginning of a great national movement to improve the surface of our highways.

### Anticipating Events.

As will be seen from our Club news on another page, the Midland Automobile Club has already provisionally fixed the date of their open hill-climbing competition at Shelsley Walsh, Worcestershire, for next season. It would be well if all the organisations that propose to arrange competitive events in 1907 would make similar haste in announcing the probable dates, so that the over-lapping which has occasionally occurred to mar the chances of success of meetings that would otherwise prove attractive may be avoided. An early decision with regard to the provincial meets of the Motor Union would prove of assistance to secretaries in making their fixtures, and, although the towns need not now be determined upon, the dates might be settled.

### Preferential Taxation.

ALTHOUGH the conference to which we made full reference last week decided in favour of a resolution to the effect that medical men should be taxed on a different basis to ordinary motorists, the Motor Union committee has declared its disapproval. Major Cole, of the Lincolnshire Club, brought the matter forward. He confessed that his sympathies were with the doctors, but the Motor Union should remain impartial, and not allow itself to recommend something which they knew would not be practicable. He considered this suggestion was impracticable, and he would be very sorry to see the report adopt a principle which they knew full well would not be carried out. Consequently he moved that the last words in the section as to differential treatment of cars used by doctors be not approved by the general committee. This was seconded and adopted. Having regard to the fact that the original resolution was only carried by a very small majority, probably this solution of the matter is the best course to take under the circumstances.

### Sabbath Motorists.

THE spiritual use of the motor-car is, as Lord Tomnoddy would say, "quite a new thing," and has not received the attention it merits. Bishops and dignitaries of the Church have made diocesan visits by means of the automobile; General Booth's accelerated missions are a feature of the religious world; and Nonconformist leaders of the type of the Revs. F. B. Meyer and Silvester Horne have fulfilled flying preaching appointments by car, while the Rev. R. J. Campbell regularly uses his automobile to reach the City Temple. The plans of a place of worship now being erected in a Sussex village includes a garage for the convenience of the wealthy

members of the congregation. All this, however, is small talk when compared with what has occurred at a meeting of the Sheffield and District Federation of Free Church Councils, when from the Rev. W. Marcus came the novel suggestion that town ministers should go out into the country by motor-car on Sunday afternoons to take services. They could preach from their own pulpits morning and night, and nevertheless give the village churches a fillip. Elaborating the idea, he pointed out how many people went motoring on Sundays, and he proposed the services of these should be obtained to take out two or three men, dropping them at pre-arranged places, and calling for them subsequently. At the furthest point of the journey the chauffeur should be induced to stay for the service, instead of going off for his own enjoyment.

#### Begin at Sheffield.

THERE are many possibilities in such a plan. First, it destroys the objection which ministers are said to hold to Sunday motoring, for it includes them as persons who would not demur to motoring on the Sabbath day. It would undoubtedly improve the health of many of the town ministers, and possibly enlarge their vision by giving them new views of

A Snapshot from Bredenköpf, Germany.—Bringing in the last of the Harvest.

the country; but probably the chauffeur might wish to have his selection of preacher instead of being consigned to the man at the point furthest from the town. These are, however, details; the main point is the suggestion has been made, and we should like to hear what the Sheffield Free Church Council and the Sheffield Automobile Club consider of the idea. Possibly, if they arranged a conference on the matter, some useful ideas for the information of other associations would be promulgated.

#### Across London.

THERE is an appreciable difference in the traffic of London just now as compared with that of, say, a couple of months ago, as those who are in the habit of using the motor-bus with any regularity well know. Some noisy vehicles have been taken from the road, and somewhat less noise is now heard in the City. And yet no fewer than three hundred separate routes now converge on the capital. Some of the motor-buses are opening up direct routes between places which were previously difficult of connection. Not so very long since,

in order to get from the Elephant and Castle to such a place as Cricklewood two changes had to be made, and an hour and a-half occupied on the journey. Now there is a motor-bus making a through journey in two-thirds the time. The same thing is happening everywhere in town.

#### Delivery Vans.

MANCHESTER is becoming quite an important centre of the automobile trade and several new motor-car establishments have recently taken, or are about to commence, their abode in the great Lancashire centre. One of these companies intends to adapt to the requirements of the city a plan which was tried with much success at Newcastle-on-Tyne some time ago. In order to encourage tradesmen to try commercial vehicles in their business it is proposed to hire out light delivery vans and commercial cars of a greater power. The rates will be inclusive of driver, and should the particular vehicle be subsequently purchased, an allowance of half the sum paid for hire will be made. This should prove attractive to tradesmen anxious to be well in line with the times, but who are fearful to take the plunge without preliminary knowledge. Recent months have proved the value of the motor vehicle in delivery work, and the Manchester experiment should convert many keen business men in that city.

#### The Delivery of Bread.

ON this subject of delivery by automobile we have heard an objection to the use of the motor-car by bakers and the like. This is, perhaps, one of the few trades where the present system will last longest. As a rule the baker goes on his journeys alone. While he is delivering the bread the horse stands patiently on the roadside, and then leisurely walks to the next house at which a call is to be made. In the case of the motor-car superseding the horse, the housewife would probably fancy she smelt petrol and oil and general mechanical abominations when her bread was handed in. And yet the baker could scarcely afford to send two persons with one cart. The many halts that are necessary in a prosperous round are also factors that may retard the progress of the car with the baker. But there are many other trades waiting the services of the automobile.

#### The Inflation of Tyres.

THAT motorists are paying more scientific regard to the care of their tyres than was formerly the case is apparent from the number of tyre gauges that have lately been introduced with a view of guiding them towards the correct inflation. A tyre that is maintained at a correct inflation will last considerably longer than one allowed to run insufficiently inflated, and in their catalogues the makers of tyres are now giving useful advice on this subject. The minimum pressures which one leading firm recommends are as follows:—60 lbs. for 3 in. tyres, 70 lbs. for 3½ in., 80 lbs. for 4 in., and 90 lbs. for 4½ in. and 5 in. tyres. Where non-skids are employed the tyres should be inflated to a slightly higher pressure than plain covers.

#### Technical Education.

MOTOR-CAR education has extended to the provinces, and at Manchester, Bradford, Coventry and other centres of engineering, facilities for instruction in motor-car work are now provided. In addition, some firms in the industry have provided means of instruction for their drivers and work-people, while the scheme of examination in driving and also in mechanical proficiency prepared by the A.C.G.B.I. has been recognised by the Commissioner of Metropolitan Police and has also received the approval of the Royal Commission. It is well that already the demand for full knowledge of the technical aspect of the automobile is being recognised by the educational experts of the country, and that

laboratory research work can now be carried out in the leading institutions of the country. Such development cannot fail to have a good effect on the progressive advance of the British industry.

#### Signs on the Road.

BERKSHIRE deserves credit for the good work lately done by its County Council in having notice boards put at the entrance to its villages, indicating to users of the highway where they are.

The way in which this work is done by the Post Office authorities is not uniformly satisfactory, and on the suggestion of the Blackpool A.C. the Signs and Notices Committee of the Motor Union is providing boards for erection in special localities. This new committee is setting to work in a very businesslike way, and promises to prove a useful adjunct to the many other organisations already in the field, or, we suppose we should write, on the road. In our last issue

running cars leave behind in their locality; and they are not always encouraged as they deserve to be. Hence the note of harmony that prevailed on the occasion of the Argyll reunion was a pleasant interlude in a heavy week. Mr. W. A. Smith, from the chair, was able to strike a note of confidence with regard to the future; Mr. A. Govan to justify his development of the system of specialised production on a gigantic scale, and Messrs. Parker Thomas, of Cardiff, and George Owen (Stirling) to emphasise the great future before the motor-car movement in Wales and Scotland respectively, as well as in England, where it is well apparent, and where, as Mr. Massac Buist said, conduct is, after all, the most important factor in the education of public opinion with regard to the problems, as well as the dust, raised by the motor-car.

MOTORISTS generally are fairly familiar with trunks associated with the name of Mr. Louis Vuitton, at whose London establishment, 149, New Bond Street, W., may be seen a wide

General View of the Start of the French Reliability Trials of 1907 Models from Paris.

reference was made to similar energy being displayed by a club in France, and the way in which it is distinguishing the villages in that country might well be considered in this.

#### The Argyll Reunion.

THE Motor Union is not entirely out of the wood with regard to its insurance scheme, and the automobile agents throughout the country must not be expected—however much they recognise their obligation to the Union—to become

active advocates of its claims. That was indicated to Mr. Rees Jeffreys by one of the speakers at the Argyll dinner last week, when the heads of the Argyll Company and the secretary of the Motor Union enlogised the good work done by the agents in remote districts. Their task is often difficult and hazardous; they have to mediate between the maker and the user; they incur the odium, as well as the dust, that fast

range of specimens. The trunks are perfectly dust and watertight, while being light and neat in appearance, and being supplied in any colours to match the upholstery of the car to which they are to be fitted is a great point in their favour. They are supplied with the necessary straps for fixing safely to the car, and many of the types are provided with rubber bars to prevent the roof of the car being scratched. The fittings of some of the trunks are ingenious to a high degree, everything being adapted not only to utilise the available space to the best advantage, but care is taken that each compartment is really suited for the particular garments or articles for which it is designed. The Vuitton trunks and bags for automobiles are certainly calculated to add to the comfort of those who tour. A "Sac Chauffeur" has also been introduced for carrying spare motor tyres and utilising the inner space. This is covered with a waterproof material with expanding sides, and the lid can be raised to suit the height of the contents carried in the box.

# A Three-Weeks' Tour in Brittany.

By G. C. ASHTON-JONSON. (Concluded from page 835.)

FROM Havre we ran through Honfleur to the ferry on the Seine at Quillebeuf, the first place where this fine river can be crossed. Thence to Caen by Pont Audemer and Pont L'Eveque is an easy run. At this old capital of Normandy the churches of the Abbaye aux Hommes and the Abbaye aux Dames, with the fine parish church of St. Pierre, form a rich treat. Bayeux, with its magnificent cathedral, was the next point of interest, and via St. Lô we arrived at Avranches. The Hotel de France here is owned by a proprietor who takes a great interest in his garden, which he shows with much pride to his guests. The view from the public gardens across the bay to Mont St. Michel is superb. We revisited the famous "Mount," too well known to need description here, and our next stopping place was Dinan. After a run to Dinard and the neighbouring "plages," we struck right across the heart of Brittany through the district known as

the peasant women often exhibited unreasoning fear, scrambling out of their carts with unheeding speed, their terror, however, being unaccompanied by anything like resentment. Everywhere, indeed, the people seemed to regard the automobile with amused cordiality, the children often shouting out "Vive l'Auto" after us and waving us on. This attitude of the people, combined with the total absence of the futile speed limit and the fatuous police traps in vogue still in England, is one of the reasons, in addition to the excellent cooking and moderate prices of the hotels, that make motor touring in France so attractive and so satisfactory in every way.

Our return journey lay through Hennebont, a picturesque town on a small river, with memories of the English occupation of the country, and so *via* Baud, where there is a fine old church, and Calvary, to Josselin, the seat of the Duc de Rohan. The Duc is a model

Mr. and Mrs. C. Ashton Jonson on their 15-h.p. White Steam Car.

The Chateau de Josselin, Brittany.

the Montagnes Noires, high and hilly country, but neither black nor mountainous. Here the natives evidently did not see many motor-cars, for, although the horses never seemed to mind us,

of an up-to-date French nobleman, for he represents the district in the Assembly and is the Mayor of the little town. Moreover, he very hospitably allows visitors to see the

historical old castle and the beautiful gardens at any time, even when the family is in residence. The Castle is one of the most beautiful buildings in France, finely situated on the bank of a river. The architecture is of different periods—the fortified towers dating from the Middle Ages, whilst the inner side of the Castle is a gem of the later Gothic period. The town is full of quaint bits, and the church is exceptionally fine.

Thence to Nantes is a short day's run through fine open country. Nantes itself is, however, not a particularly attractive city, though commercially important and thriving. The Cathedral is very beautiful, and the ancient Castle stands picturesquely on the river, but we were glad to get on to Angers. Here the Hotel du Cheval-Blanc was one of the best we struck. The proprietor is watchful for his guests' comfort, and a testimony to his merit as an employer is afforded by the fact that dinner was served to us by an old waiter who had been forty-three years in his service, and had won the decoration awarded by the Government for thirty years spent in the same situation. At Angers the Castle is of the greatest interest, while in the Maison de Pincé there is a Renaissance house dating from 1539, in perfect preservation, that can compare with the Maison de Jacques Cœur at Bourges. The Cathedral at Le Mans is perhaps the finest on the route so far, being only surpassed, if then, by the famous Cathedral and the Abbaye de St. Ouen at Rouen. From the latter city we ran to Havre, visiting on our way the lovely ruins of the Abbeys of Jumièges and St. Wandrille.

Envious detractors are never tired of saying "motorists see nothing," the wish being doubtless father to the thought. As a matter of fact, motorists nowadays are the people who see everything, and those who have not a motor-car see comparatively next to nothing. In old days, i.e., a few years ago, when the traditional position of the motorist was on his back under the car, the envious gibe may have had some truth, but we did 1,100 miles on our 15-h.p. White steam car without a single mechanical road-stop. A tribute to the silence of the car was the fact that we frequently heard it described as "la voiture électrique." We had the misfortune to have five punctures, but on each occasion the cause was a long nail that would have gone through any tyre. We had no tyre-troubles caused by undue strain from the car or over-heating. Our car, which had done 10,000 miles last year, went better than ever, and carried two of us in front, with our man and a fair amount of luggage in the tonneau, with the greatest comfort. On the straight roads we often touched forty miles an hour on the level, and once the speedometer indicated forty-five, which was very near the limit of its registering powers. The price of petrol in France is twice as high as in England, which caused us to regret that we could not purchase the lower grade spirit that we use successfully in England at 7½d. per gallon.

The boats on the Southampton—Havre route are comfortable, provided one can secure a deck cabin, otherwise it is not to be recommended, except for the admirable way in which cars are handled at Southampton. It seems a point of honour with the companies that manage cross-channel boats—for all routes are alike in this—to see how closely they can approximate the food on board to that obtainable presumably at a cabman's shelter or third-rate coffee stall. Filthy coffee, made seemingly with one of the "coffee extracts," condensed milk, stewed tea, made apparently with water from the boilers, bread, at once stale but damp, sour and tough, and spread with margarine like butter, is the only fare procurable; a striking contrast to the fragrant coffee and appetising rolls and butter of the invariable French breakfast. Verily there are some things that they manage better in France, and many are the holidays that we hope to have in that beautiful and friendly country.

LIEUTENANT WINDHAM, R.N., has compiled an interesting book of 300 Motor Wrinkles for his brother motorists. These have been gained by years of experience in the driving of nearly all the leading types of English and foreign cars, and will doubtless be of service to the motorist in rendering first aid to his car. Messrs. Iliffe and Sons, Ltd., are the publishers.

## ARE WATER-COOLED BRAKES DESIRABLE?

FOR some time past the employment of water-cooled brakes upon heavy high-powered touring cars has not been uncommon. The intent of such cooling provisions as applied to metallic braking surfaces is to keep the temperature of the frictional surfaces below that at which lubrication ceases to be effective and at which rapid cutting of the metal takes place. A portion of the cylinder cooling water may be circulated through channels in the brake shoes, or, if the braking surfaces operate in an oil bath, may be jacketed with the circulating water. It is undeniable that in the descent of long hills ordinary metal-to-metal brakes may become, through use, so hot as to cut and wear so seriously as to call for extensive subsequent adjustment, if, indeed, they do not fail to hold before level ground is reached. Under such exceptional conditions the water-cooled brake may prove of great value. It is, however, remarks an American contemporary, a question, as it so often is in automobile practice, "whether the game is worth the candle," or, in other words, whether the result attained warrants the expense and complication involved.

Mr. Philip Dawson on his 45-h.p. Daimler Car.

By the employment of brakes having the largest allowable frictional surfaces and good heat conductive facilities, by the use of materials which will not cut or abrade one another unduly, except under extreme abnormal conditions, and the design of each of the two alternative braking systems of such power that either will control the vehicle under any condition—thus allowing of the alternate use of each and the simultaneous cooling of the other—the need for artificially-cooled brakes, with their attendant water connections, may be minimised. In cases in which exigencies of design limit the sizes of braking surfaces to dangerously small dimensions, water cooling may doubtless be adopted with advantage, but it is somewhat questionable whether it should be resorted to unless the resources of designing have been exhausted in an attempt to provide adequate surfaces capable of keeping sufficiently cool naturally. It may be remarked that the diameters of brake drums are generally not closely limited by any constructional condition, and that drums of large diameter are mechanically advantageous rather than otherwise, on account of the fact that the braking torque required to absorb a certain amount of energy decreases with the diameter of the drum, and all stresses upon the mechanism decrease with it.

## CONTINENTAL NOTES.

### The 1907 International Race in Germany.

The regulations with regard to the international race which is to be held on the Taunus circuit in Germany in June next are at present under consideration. It is proposed to restrict the engines to a cylinder capacity of 8 litres, the wheel base of the cars to 9 ft. 9 in., and the maximum weight of the machines with bodies to 1,175 kilogs.

### The French Reliability Trial of 1907 Models.

The reliability trial of 1907 models, organised by the French Automobile Club, commenced on Sunday last. The cars are divided into four classes, as follows:—1. Vehicles with single-cylinder engines, of a maximum bore of 105 mm., and carrying a load of 3.3 kilog. per square centimetre of piston area; 2. Two-cylinder cars, maximum bore 120 mm.; 3. Four-cylinder cars, maximum bore 105 mm.; and 4. Four-cylinders, maximum bore 130 mm. Forty-one entries were received, and of these the following thirty-seven were duly weighed in on Saturday: a Herold, two Unics, a Chenard and Walcker, three Clement-Bayards, a Couverchel, a De Chevre, two Westinghouses,

### The 1907 Grand Prix Race.

The Committee of the A.C.F. has accepted the proposals of the Sporting Commission with regard to the 1907 Grand Prix. These have already been outlined in the *M.C.J.*, but it may be recalled that the principal alteration is the abandonment of the 1,000 kilog. weight limit in favour of a restriction in fuel consumption.

### Another Reliability Trial.

The Autocycle Club of France has decided to hold, from the 18th to 20th May next year, a reliability trial for touring motor-bicycles, tri-cars and voiturettes. The competition comprises a run from Paris to Ostend and back, and a series of speed trials.

### The Stopping Power of Motor-Cars.

A series of trials were carried out on Sunday last in the Bismarckstrasse, Berlin, to test the distance in which motor-cars could be brought to a standstill as compared with horse vehicles. The experiments were organised by the Automobile Technical Society in view of the Bill about to be laid before the Reichstag regarding the responsibilities of motor-car owners and drivers. The result of the tests easily demonstrated the superiority of

Guippon, the well-known racing motor cyclist, at the wheel of the Lion-Peugeot Voiturette.

Gaudermann on the Clement-Bayard!

### THE FRENCH RELIABILITY TRIALS OF 1907 MODELS.

three Decauvilles, a Miesuset, a Martin-Lethimonnier an E.G.A., a Lucia, three De Dions, a Fouillaron, an Opel, a Lacoste, a Battmann, a Boyer, two Bolides, two Aleyons, three Lion-Peugeots, a Legros, a Darracq, a Prunel, and two Martinis. The competition consists of a run from Paris to Monte Carlo and back, the journey being made in eight daily stages ranging from 200 to 331 kilometres. At the end of the outward trip the competing vehicles will be on exhibition for three days in Monte Carlo. The first day's run was to Dijon, 311 kilometres, when the two Bolides met with accidents which put them out of the competition; the Miesuset being also *hors de combat* as the result of a skid. Lyons was reached on Monday and Marseilles on Tuesday.

### The Emission of Smoke and Over-Lubrication.

The activity of the police with regard to cars emitting blue smoke as a result of over-lubrication has brought about a marked improvement, the frequent fines having caused drivers to pay more attention to their engines. An important decision was given at one of the Paris police courts recently, when over 100 owners were summoned for allowing their cars to emit too much smoke, the magistrate deciding that it was the driver, and not the owner, who was responsible for the infraction of the law.

motor-cars. For example, in the trial between a motor-cab and an ordinary horse cab, the former stopped within six yards, the horse drawn vehicle taking thirty yards. In several similar tests the horse cabs lessened the distance, but the automobile always won.

### The Coupe d'Auvergne.

As a result of the success of the reliability trial for touring cars held last season, the Auvergne and Centre Automobile Clubs have decided to repeat the event in August next year. There will be five daily runs extending from 162 to 211 kilometres, while the programme will also include a series of speed trials at Bourges.

### Miscellaneous Items.

It is reported that the De Dion Co. are building several 60-h.p. eight-cylinder cars for competition in the touring car race on the Taunus circuit in Germany next year.—The reliability trial of heavy vehicles for military purposes organised by the A.C.F. is still in progress. Of the nineteen cars which left Paris early last week, fifteen safely reached Avignon on Sunday last.

HAVING already two steam rollers, the Highways Board of the Isle of Man finds itself unable to accept the offer of the A.C.G.B.I. to provide another.

MESSRS. ASTER, LTD., have lately issued a separate price list of spare parts for each size of the well-known Aster engines. Every part is given a distinct number, so that duplicates can be obtained rapidly and with a minimum of trouble.

MESSRS. BEEBE, COURTNEY AND SCOTT, of Shoreham, have built a motor-boat, fitted with a 15-h.p. Brooke motor, for Mr. Harry Preston, of the Royal York Hotel, Brighton.

THE East Westmorland Rural District Council have passed a resolution in favour of a speed limit of twenty miles an hour, after rejecting a motion for a maximum limit of fifteen miles per hour.

THE Victoria Street Garage, of 94, Victoria Street, S.W., have issued a tariff of their charges for letting cars on hire and of fees for their classes for instruction in mechanism, running repairs and driving.

RATEPAYERS in Cannon Place, Brighton, have been complaining of the noise made by motor-cars standing in their vicinity, and the matter has been referred by the Town Council to the Chief Constable.

THE Bowden patent wire mechanism is now being made in numerous sizes or diameters and in five different grades of finish, the material and price of each varying in order to adapt it for the many different purposes it is intended to serve.

BOUGHTON, although only a little place near Faversham, has an excellent motor-car repair establishment—thanks to the enterprise of Messrs. G. Lossell and Co. Being on the main road for Ramsgate from London, they have often been able to assist motorists in trouble.

THE Liverpool Motor House, Ltd., have secured a large building in Peter's Lane, Church Street, Liverpool, which they are having fitted up as a first-class garage, in which all the motorist may require will be found in the way of good accommodation, day and night.

THE Adams Manufacturing Company, of London and Bedford, offer a prize of £2,000 to the person who shall succeed in flying from London to Manchester in one day, with two stoppages en route to pick up petrol, provided the flight be accomplished with a British-made flying machine propelled by a British-built Antoinette motor.

THE 4,000 mile trial of the 25-h.p. Straker-Squire C.S.B. car, under the official observation of the A.C.G.B.I., has been completed. The various daily runs have been consistently uniform and without incident, while the Continental tyres fitted to the wheels of the car were not even pumped up after the start of the trial.

THE Continental Tyre Co., Ltd., have again laid motorists under a debt of obligation by the publication of their handbook "How to Treat and Repair Pneumatic Tyres." The work extends to one hundred pages, is fully illustrated, and deals with most of the hazards that are encountered on the road, with suggestive hints as to getting over defects in tubes and tyres, according to the most approved methods.

MR. L. SOUTHWOOD JONES, of Risca, Mon., who purchased a 7-h.p. Star car in February last, writes that he has driven it about 5,000 miles, and has found it most satisfactory. In a tour to the North of Scotland in September last he ran the car 490 miles in four consecutive days without an involuntary stop, and the whole tour of 1,300 miles was done on an average of over thirty-seven miles to the gallon.

M. KRAYN, of Berlin, has sent us a copy of the Automobil Technischer Kalender for 1907 that he has just issued. The work is on the usual thorough lines of this class of German publications, and includes a description of the components of the modern motor-car. Ignition, clutches, springs, steering gear, carburettors, and transmission systems, are all fully dealt with, the Kalender altogether forming an excellent reference book for motor-car designers.

## HERE AND THERE.

A CORRESPONDENT suggests the use of the words "convex" and "concave" instead of "male" and "female" to describe the two portions of a friction clutch.

It is announced that with the beginning of next season

Barnum and Bailey's world-famed "Greatest Show on Earth" will abandon railway travel and take to the highway in automobiles.

THE British Automobile Commercial Syndicate have lately supplied a 45-h.p. Mercedes car, with double landalet body by Rothschild, to the Marquis of Anglesey.

ENTRIES for the A.C.G.B.I. competition of devices to prevent the side-slip and skidding of motor-buses close on the last day of the present year. The test will include a road endurance trial of about 1,000 miles.

ON Wednesday last week Messrs. A. Darracq and Co., Ltd., entertained their agents and friends to dinner at the Trocadero Restaurant, London, W. Business was entirely tabooed, and, under the chairmanship of Mr. Rawlinson, a very pleasant evening was spent.

THE value of the motor-cars and parts exported from the United States during September last is returned at £61,551, as compared with only £38,899 in the corresponding month of 1905. Of the total Canada was responsible for £22,016, and England for £13,872.

A SIMPLE and efficient tyre gauge has been introduced by the Roberts Non-Skid Motor Tyre Tread Manufacturing Company, of the Gripwell Works, St. Mary's Row, Birmingham. This

provides a positive means of ascertaining the pressure inside the tyre, thus ensuring inflation to the correct pressure. The device is pictured in the accompanying illustration, and has the advantage that it need not be removed from the tyre until sufficient pressure has been obtained. The gauge is shut off during the process of inflation, and cannot be strained at every stroke of the pump. To read the pressure in the tyre only one movement is necessary, which cuts the pressure off from the pump and at the same time automatically raises the seat of the tyre valve, creating a clear passage from tyre to gauge, which registers the actual pressure inside the tube.

There are no taps or screws to manipulate and the gauge is entirely automatic in its action.

MR. F. WALTER, writing to the "Morning Post," says that the Royal Commission has wisely decided against the speed limit. "You might as well," he continues, "provide against gun accidents by forbidding the use of a cartridge which would shoot more than thirty yards. The idea that the moment speed limits are abolished we shall have people driving all over the place at forty miles an hour is absurd. The enormous majority of motorists drive as fast as they find safe under the circumstances, having regard to what is good manners to the occupants and drivers of other vehicles, and they always will."

"MOTOR Fashions for To-day" is the title of the Lacre Motor-Car Company's latest catalogue, which bears evidence of artistic taste and careful editing. In this many new designs in garments for ladies and gentlemen who motor are illustrated, a capital feature being the "Torrent-proof" material, which is a speciality of the concern. An interesting section, which we do not remember to have seen so fully represented elsewhere, is that devoted to children's motoring attire. The uncertainty of the English climate should lead to careful attention being given to this branch, and the Lacre Company deserve success for the skill with which they have designed and executed garments for youngsters. Aprons, muff's, gloves, gauntlets, boots, goggles, caps, &c., as well as clothing, are enumerated in this complete catalogue of the clothing department of the well-known Poland Street firm.

# The Olympia Motor-Car Show.

(Continued from page 852.)

## The Dennis Cars.

For the 1907 season Messrs. DENNIS BROS., LTD., will devote attention to three sizes of pleasure cars—14-h.p., 20-h.p., and 30-35-h.p.—all fitted with four-cylinder engines. Principal interest in their exhibit was centred on the polished chassis of the new 30-35-h.p. model, on which

Fig. 44.—The Dennis 30-35-h.p. six-seated Phaeton.

a number of special features are incorporated. Needless to say, the Dennis system of transmission by a cardan shaft and worm gear on to a live axle is retained. The engine is a new design, comprising four separately cast cylinders, 120 mm. bore by 130 mm. stroke, with the valves arranged on opposite sides. The ignition is by high tension magneto, a reserve by coil and accumulators being also provided. Synchronous firing is obtained by means of a single cam contact maker mounted on a spindle which runs at a speed four times that of the crank shaft. Thus any wear which may take place cannot bring about any variation in the time of the explosion in one cylinder as compared with the others. Special attention has been paid to the engine lubrication to prevent the emission of smoke. The oil is circulated from a sump by a geared pump to all the bearings, and drained back to the crank case, which is especially constructed to retain a sufficient amount to lubricate in case of the pump failing, by splash feed, and automatically to regulate the amount, so as to avoid any possibility of over lubrication by an ingenious overflow arrangement which allows any excess to pass from the crank case back into the sump. The clutch is of the leather-faced cone type, much larger in diameter than Messrs. Dennis have hitherto employed. The change-speed gear is arranged to give three forward speeds and a reverse, with direct drive on top speed. The weight of the car is carried by the sleeve surrounding the live axle, which latter transmits its power to the rear road wheels through dog clutches. Ball bearings are used throughout, except on the engine, while the road wheels are of the staggered-spoke, or double artillery type. The front axle is of tubular construction, the pivots being mounted on ball bearings. The usual spring hangers at both front and rear are replaced by halves of inverted semi-elliptical springs. Throughout the car bears evidence of careful design and construction, so that the Dennis vehicles may be expected to fully maintain the high reputation they enjoy. The complete cars on view included a 20-h.p. Roi des Belges phaeton with canopy top, an exactly similar model to the one run under the Automobile Club's observation last March, when it established a record for reliability of 4,007 miles without an involuntary stop, a 24-30-h.p. double phaeton with canopy, and a 24-30-h.p. limousine landaulet, the body work of which, of Messrs. Dennis's own construction, is of a very high class.

## The Unic Car.

In addition to the Brasier cars, Messrs. MANN AND OVERTONS, LTD., were exhibiting a couple of the well-known "Unic" cars. These show no alteration from the 1906 models, and as they have been illustrated and described in the *M.C.J.*, it is only necessary to mention that the 10-12-h.p. two-cylinder car on view was the vehicle which won a

silver medal in the recent town carriage competition, and is representative of a large number of motor-cabs now in service in the Metropolis. The 14-20-h.p. model, which is on similar lines, except that it has four cylinders, is fitted with a luxurious detachable limousine body. Although not actually on the stand, Messrs. Mann and Overtons had running outside the show a new 10-14-h.p. Unic cab in which the four cylinders are in one casting, and the valves all located on one side. The ignition is by high-tension magneto and the change-speed gear adapted to give three speeds forward and a reverse, with direct drive on top through a cardan shaft and bevel gear to a rear live axle. Ball bearings are fitted both in the gear-box and to the axles. We hope to deal with the new vehicle more fully in a subsequent issue.

## The Scout Six-Cylinder Cars.

A prominent feature of the exhibit of Messrs. DEAN AND BURDEN BROTHERS, LTD., was the new Scout 25-h.p. six-cylinder car, a view of the motor of which is given in Fig. 45. The crank chamber is of aluminium cast in two parts only, with the division running horizontally. The bottom half of the chamber is merely an oil tray, and may be removed without in any way disturbing the crank shaft bearings. At the same time three inspection doors permit the big ends to be readily inspected. The crank shaft is turned up from a nickel steel forging, and special attention has been devoted to obtaining a perfect balance. The connecting rods are of H section stamped steel, accurately machined to a given weight. The crank pin end of each connecting rod bearing is fed with clean oil direct from the lubricator on the dashboard to the middle of the bearing by centrifugal force. The cylinders, which are 10 mm. bore by 115 mm. stroke, are bored and ground to gauge, so that they are interchangeable, as also are the pistons and piston rings, gudgeon pins, &c.; the cam shaft and cams are produced from the solid bar in one piece. Two systems of high tension ignition are provided. The contact maker for the coil ignition is mounted on a vertical spindle, driven off the cam shaft by spiral gears, and we note that a dial and pointer is fitted to the commutator shaft to indicate which cylinder should be firing when testing the coil. The magneto is of the high tension type; it is gear-driven, and is fitted on the opposite side to the valves in the centre of the motor. The nickel steel valves are interchangeable, and are all actuated off one cam shaft. The governor is connected directly to the piston throttle of the carburettor by means of a light steel rod. The inlet pipes are so arranged that each cylinder receives the same quality and quantity of gas from a single carburettor, which latter does not need pressure feed to maintain the supply of petrol in the float chamber. The fan revolves on ball bearings, and is driven by a steel spring belt off a pulley on the cam shaft. The clutch, which

Fig. 45.—The Scout Six-Cylinder Engine.

is of the leather-faced cone type, is provided with three clutch springs externally adjusted by means of three hexagon nuts; it is mounted on an extension of the engine crank shaft, and is connected to the gear-box by a jointed shaft. The transmission is through a three speed gear-box and cardan shaft to a live axle. The frame of the car is of armoured wood. A useful feature is seen in the flywheel, which is

marked out with arrows indicating where each inlet and exhaust valve should open and close, as well as the point of firing of each cylinder. The motor can be run as slow as 180 revolutions per minute, and can be accelerated up to 1,800 revolutions per minute. The h.p. is 25 at 1,000 revolutions per minute. Messrs. Dean and Burden were also showing the 17-20-h.p. Scout T.T. 1906 car, which finished ninth in the Tourist Trophy race of 1906; and a 17-20-h.p. four-cylinder Scout with 'andaulet body.

#### The Junior Car.

Still another addition to the list of Italian built cars was seen in the 24-h.p. Junior chassis (Fig. 46), exhibited by JUNIOR, LTD. The engine

The throttle and governor control is so devised that there are but few wearing parts. The control is by a single lever on the steering wheel and an accelerator pedal, the latter being connected up to the governor and ignition. High-tension magneto ignition is used on the six-cylinder chassis only, all the other models being equipped with low-tension magnetos. A half-compression device is fitted to facilitate the starting of the engine. The clutch, which is of an improved plate type, requires no exterior lubrication, the crankshaft being hollow, by means of which such little lubrication as is required is furnished by the engine. A feature of the gear-box is that it furnishes a direct drive on the third and fourth speeds, this being obtained by means of two bevels on the end of the gear shaft meshing with two crown wheels arranged one within

Fig. 46.—Chassis of Junior 24-h.p. Car.

has the four cylinders cast separately, and the valves on opposite sides. The ignition is by low-tension magneto ignition, the igniters being operated by horizontal cams mounted on vertical spindles. The carburettor has an inter-connection between the hand-operated auxiliary-air valve and the petrol jet. The clutch is of the multiple-disc type, and the gear-box, which is controlled by a lever working in a "gate," gives four forward speeds and a reverse, the final transmission being by side chains.

#### The Berliet Cars.

The new models of the Berliet cars shown by Messrs. W. WATSON AND Co., Liverpool, and Messrs. J. E. HUTTON, LTD., London, comprised a number of interesting points. Pride of place was given to the

the other on the differential shaft. Both the bevel pinions are free to run on the propeller shaft, one or other being engaged as required by means of a dog clutch. The gear-box and differential case are one casting, but are divided internally into two compartments. Another interesting exhibit was a 40-h.p. four-cylinder light chassis weighing only 16 cwt. Except as regards the ignition, which is by low tension magneto, the arrangement is on similar lines to "six," the ingenious gear-box giving a direct drive on the third as well as on the fourth speed. The complete cars on view included a 22-h.p. Berliet, fitted with special side entrance body by Salmons; it is provided with a new form of disappearing auxiliary seats, the latter being so arranged that when out of use they are completely hidden under the back seat and when required for

Fig. 47.—Chassis of Berliet 60-h.p. Six-Cylinder Car.

chassis of the new 60-h.p. six-cylinder vehicle, of which an illustration is given in Fig. 47. The cylinders, which are cast in pairs, are 120 mm. bore by 140 mm. stroke, the valves being located on opposite sides. The fly-wheel fan has been abandoned in favour of one behind the honeycomb radiator. The lubrication is by means of a rotary pump driven off one of the half-time shafts, this forcing the oil up to the dashboard, where it is controlled by means of three easily adjusted sight feeds, two of which go to the motor and the third to the gear-box.

use can be quickly opened out into comfortable arm chairs. The new 22-h.p. Berliet town carriage was also worthy of notice, the frame being of the dropped type to enable the passengers to mount directly from the pavement into the vehicle with ease. A 22-h.p. car, identical in every respect with the chassis used in the Tourist Trophy Race in the Isle of Man, and which obtained second place, was also shown. On a separate stand Messrs. Hutton were showing examples of the latest types of Mercedes and Panhard cars.

### The Cadillac Cars.

Interest at the stand of the ANGLO-AMERICAN MOTOR-CAR COMPANY, LTD., was centred on the chassis of the new Cadillac 26-30-h.p. car (Fig. 48), with four vertical cylinders, this being the first appearance of the vehicle at an exhibition in this country. There are quite a number of interesting features on the car, of which we hope to publish a fully-illustrated description in an early issue. For the present we must content ourselves by stating that the four cylinders are separately cast, and are fitted with copper water jackets. The governor is of an exceedingly novel design, while the change-speed gear is of the epicyclic

Fig. 48.—General View of the Cadillac 26-30-h.p. Four-Cylinder Car.

type, giving three forward speeds and a reverse, the final drive being by a cardan shaft on to a live axle. The well-known Cadillac 9-10-h.p. car, with horizontal single cylinder, is still retained, but has undergone slight improvements, more particularly as regards the lubricator. It is supplied both as a two-seater and with accommodation for four persons. The body of the latter car is of ingenious design. The rear seats are made to fold up, so as to resemble a sloping tool-box. It forms an excellent vehicle for doctors' use, and has already met with a favourable reception at the hands of motorists.

### The Swift Cars.

Two new models of Swift cars were to be seen at the stand of the SWIFT MOTOR COMPANY, LTD.—a 9-10-h.p. double-cylinder and a 12-h.p. four-cylinder. The first named is well adapted for motorists of moderate cylinder dimensions are 90 mm. diam. by 110 mm. stroke, and the ignition is by accumulators. The transmission is through a cardan shaft and bevel gear to a well-designed live axle. The change-speed gear is designed to give three speeds forward and a reverse, with direct drive on top. The car, which has a wheelbase of 6 ft. 10 in., is built both as a two-seater and four-seater, the entrance to the rear portion in the latter case being through a swinging front seat. The great centre of interest at this stand was the chassis of the new 16-20-h.p.

Fig. 49.—The Engine of Beaufort 30-h.p. Six-Cylinder Motor.

Swift car, the high quality of which well repaid inspection. Throughout the details are on modern lines; the cylinders, which are 90 mm. diam. by 110 mm. stroke, have the valves so arranged that they are operated off a single cam shaft. Ignition is by high tension magneto, with accumulators as a reserve. The clutch is of the multiple disc type, and the change-speed gear-box, which gives four speeds and a reverse, with the usual direct drive on the fourth, is operated by a lever working in a "gate." The live axle is well supported, and the brakes are of liberal proportion and compensated. Ball bearings are

used throughout, except on the engine. The wheel base of the chassis is 8 ft. 11 in., which permits of any type of side entrance body being fitted, several highly-finished ones being on view.

### The Beaufort Cars.

The leading exhibit at the stand of the BEAUFORT MOTOR CO., LTD., was the chassis of the new Beaufort 30-h.p. six-cylinder car, in which several interesting features are incorporated. The engine (Fig. 49) has the cylinders cast in pairs, with the valves arranged on opposite sides; the bore is 100 mm., and the stroke 130 mm. Two systems of high-tension ignition—magneto and accumulators—are provided. The pressure in the lubricating oil tank is maintained by a small air-pump operated off the rear exhaust valve tappet. The clutch, which is of the disc type, is connected with the gear-box by a jointed shaft. A single lever working in a "gate" controls the four forward speeds and the reverse, the final drive being by side chains. Two contracting brakes are fitted on the differential shaft, those on the rear wheels being of the internal expanding variety. Fig. 50 illustrates the improved form of steering pivots of the front road wheels. As will be seen, the ends of the axle are forked, and the weight of the chassis is supported on two balls at each end. These balls rest in cups formed beneath each arm of the fork, corresponding cups on the vertical spindle member, which is itself also forked, being employed to complete the joints. The arrangement not only enables the weight to be carried on two points, but also allows the centre of the steering pivots to be brought very close to the wheel hubs, so facilitating the steering. Ball bearings are used to all parts except the engine, while the rear dumb irons are replaced by halves

Fig. 50.—Sectional View of Front Wheel Hubs and Steering Pivots on Beaufort Cars.

of semi-elliptical springs. The wheel base of the vehicle is 11 ft. 6 in. The four-cylinder cars exhibited included a 20-h.p. landaulet and a 28-h.p. double phaeton.

### The Benz Cars.

No more striking demonstration of the immense progress which has been made in automobile construction during the past ten years can be found than a comparison of the early Benz 3½-h.p. belt-driven machines with the powerful vehicles on modern lines now being turned out by the Benz firm. Prominent on the stand of the CANNSTATT AUTOMOBILE SUPPLY ASSOCIATION, the British agents, was a chassis of the new 50-h.p. live axle car. All Benz cars over 28-h.p. have hitherto been fitted with side chain transmission, so that altogether the vehicle is a fine example of engineering. The four cylinders, which are cast in two pairs, are 130 mm. bore by 140 mm. stroke. The valves are located on opposite sides, and the ignition is by low tension magneto, with accumulators and coil as reserve. No governor is provided, the speed of the engine being regulated by hand and foot levers. The clutch, which is of the leather-faced cone variety, runs on the crank shaft, which is extended beyond the fly-wheel for the purpose. The transmission is through a four-speed gear-box controlled by a lever working in a special design of "gate." The cardan shaft, which has only one universal joint, is enclosed in a casing. The braking system is on unusually liberal lines. Not only are the drums of great width, but the usual hand brakes are supplemented by two operated by pedal, one being located on the forward end of the side shaft of the change-speed gear, and the other at the rear of the gear-box. The 18-h.p. Benz live axle car was represented by a landaulet, the body being by Hooper. But few alterations have been found necessary in this model for the coming season; the half-speed wheels are now enclosed in oil-tight cases to give silence, and the lubricating arrangements have been improved. Fig. 51 depicts the 40-h.p. Benz car double phaeton in touring trim; except that the transmission is by side chains the car follows the general design of the other vehicles. One of the 1907 35-h.p. Mercedes cars was also displayed. The principal changes in this vehicle for the coming season have already been dealt with in the M.C.J., but we may mention that the carbure-

rettor is of an entirely new design, the mixture being automatically regulated by the engine speed. The method of lubricating the engine has been improved, and a fan is now placed behind the radiator in addition to the vanes in the fly wheel.

#### The Zust and Mascot Cars.

Prominent upon the stand of the FARMAN AUTOMOBILE COMPANY, LTD., was a chassis of the Zust 28-h.p. car, for which they are the British agents. Like the majority of Italian built cars, the vehicle is of the high class of construction. The engine has four cylinders, 130 mm. bore by 140 mm. stroke; ignition is by low tension magneto, and the mixture furnished by a special form of automatic carburettor. The clutch is of

Fig. 51.—The Benz 40-h.p. Double Phaeton.

the metal disc type, and the feature of the gear-box is that each of the shafts is provided with a bevel pinion meshing with corresponding bevel wheels on the differential shaft. On the top speed the drive is direct through the main shaft and its corresponding bevel drive. For the lower speeds the power passes through the side shaft, and thence to the differential, which latter is connected with the rear road wheels by side chains. Duplicate brakes are fitted on the differential shaft, and a noticeable feature is the provision for easy adjustment. The Farman Company make a special feature of the Mascot live-axle cars, of which they showed five sizes; the 8-10-h.p. and 10-12-h.p. cars having two cylinders, and the 12-16-h.p., 20-22-h.p., and 24-30-h.p. each four cylinders, the engines being of the well-known Aster type. Comparatively few changes have been made in these cars. A new type of change-speed lever is now fitted, this being pivoted at the lower end, and arranged to rock instead of slide sideways when changing over from one speed to the other. The 20-22-h.p. car is provided with two systems of high-tension ignition. An I-section front axle is employed, and the steel frame is carried on five semi-elliptical springs. The 8-10-h.p. "Mascot" two-cylinder car with landaulet body exhibited represents the type of which a large number are about to be placed in service in London as motor-cabs. The petrol capacity is sufficient to carry the vehicle 150 miles, and the change-speed gear is adapted to give speeds of 4, 12, and 18 miles per hour. The cab is specially constructed with the engine under the driver's seat, so as to give a short wheel base and allow it to turn within the small space of 25 feet, as required by the Scotland Yard authorities.

#### The Itala Cars.

Relatively few changes have been made in the new models of the Itala cars, another of the high-grade products of Italian motor-car works. Interest at the stand of ITALIA AUTOMOBILES, LTD., was mainly centred on the chassis of the 40-h.p. car. The cylinders are cast in pairs, and have large expansion joints to the exhaust junctions. The ignition is by Simms-Bosch low-tension magneto. The clutch is of the metal disc type. Four speeds and reverse are provided, operated through a "gate" lever. The cardan joints have metal cup protectors, and ball bearings are fitted throughout. The foot brake between the clutch and the gear-box is no longer provided, but the pedal previously used to operate it has been retained, it being now coupled up to the brakes on the rear wheels, which are also operated by a side-lever. The water-cooled foot-brake behind the gear-box is of course still fitted. The steering-connections are all of the ball-and-socket type. The joints are adjustable, the cups in which the ball ends of the rods rest being so made that they can be tightened up by means of a pin-spanner. The 20-h.p. car was fitted with an Italian-built park phaeton body, which formed one of the most graceful vehicles in the Show.

#### The Panther Cars.

A car in which new and special features are embodied was seen in the 14-h.p. "Panther," exhibited by Messrs. F. M. RUSSELL AND CO., whose works are at Willesden. To begin with the frame, this is built up of steel sheeting and angle-iron, the whole being riveted together and cambered in the front so as to allow of a large steering lock. The engine comprises four separately cast cylinders with the valves arranged on opposite sides; it is supported on a tubular sub-frame in such a way that by loosening the clips and removing the radiator it can quickly be withdrawn from the frame. The exhaust is ingeniously made to draw a current of cold air through the circular ribbed-tube radiator; the

carburettor is also of special design, the usual throttle being replaced by a double automatic valve. The clutch is of the metal-to-metal type, and the gear-box is adapted to give three speeds forward and a reverse, with direct drive on top speed through a cardan shaft and bevel gear to a live axle. The road wheels are fitted with Turquand detachable rims.

#### The Fiat Cars.

For the coming season four sizes of the well known Fiat cars are being made, 14-16-h.p., 18-24-h.p., and 30-40-h.p. four-cylinder and 60-h.p. six-cylinder. The latter naturally attracted considerable attention at the stand of FIAT MOTORS, LTD., especially as it fully maintains the high standard attained by the makers. The cylinders, which are cast in pairs, are 125 mm. bore by 150 mm. stroke, are cast in pairs, and fitted with removable pressed steel covers, which allow easy inspection and cleaning of the water jacket. The valves are placed on opposite sides of the cylinders and are interchangeable. The ignition is by low tension magneto with automatic advance and retard. The feature of the carburettor is that the petrol and supplementary air ports are moved together by a single automatic movement, which not only assures a constant mixture, but also tends to reduce the petrol consumption to a minimum. In fact, the high efficiency to which the new carburettor has been brought is claimed to give increased brake horse power with less consumption of petrol than in former models. The throttle is controlled both by the governor and by a lever on the steering wheel, a foot accelerator being also provided. The radiator is attached to the frame by pivoted joints, so that it is not strained by travelling over bad roads. The arms of the flywheel are formed as vanes, to act as a fan. The familiar type of dredger lubricator has been replaced by one more positive in action, cams actuating small plungers forcing the oil to each bearing, in place of letting it reach its destination by gravity. The clutch and change-speed gear is on the usual Fiat lines, the final transmission being by side chains. Two water-cooled brakes, controlled by a single pedal, are provided, one being mounted on the differential shaft and the other on the forward end of the gear-box side shaft. The brakes on the rear-wheel hubs have been considerably improved; they are of the internal expanding type, operated by cam action, and can be readily renewed. A feature of the 60-h.p. six-cylinder and the 30-40-h.p.—the latter being, except as regards the number of cylinders, on similar lines to the more powerful car—is the new Fiat self-starting device. The arrangement is extremely neat; reference to Fig. 52 will show that fixed on the crank case, between the engine and the radiator, is a miniature water-cooled cylinder which is really an air-pump, the piston of which is worked by a ball eccentric off the crank shaft. It compresses air into an ordinary cylinder up to a pressure of 12 atmospheres. A lever on the dashboard operates a valve which admits the compressed air to a pipe communicating with a series of

Fig. 52.—The Fiat 30-40-h.p. Motor. The air compressor in connection with the self-starting device is seen between the radiator and the engine.

supplementary inlet-valves arranged at the side of the exhaust valves. Simultaneously with opening the air-valve the same lever draws half-compression cams into action, so that the engine can start more easily. Once the engine is running on the carburetted charge, the supplementary inlets are automatically closed. The apparatus is fitted with an attachment to which a rubber tube can be fixed, which allows of the inflation of the tyres in a few seconds. The new 14-16-h.p. car, which had not arrived when we visited the stand, is fitted with cardan shaft transmission of exceedingly novel design. In the absence of drawings it is not possible to clearly describe the arrangement, but it may be mentioned that the differential is mounted behind the gear-box and not on the live axle as usual, the drive being conveyed to each half axle by concentric shafts and bevel gearing.

### The Brown Cars.

At the time we visited the stand of Messrs. BROWN BROTHERS, LTD., the chassis of the 40-h.p. six-cylinder Brown car, of which a description was given in a recent issue of the *M.C.J.*, had not arrived. Two of the standard 20-22-h.p. four-cylinder vehicles were, however, on view, one being fitted with a landaulet body and the other as a side entrance double phaeton. The construction is on the usual lines of live axle cars. The engine (Fig. 53), which has the cylinders cast in pairs, has a bore of

Fig. 53.—Sectional elevation of the Brown 20-22-h.p. motor.

100 mm. by 120 mm. stroke; a variable lift is provided in connection with the inlet valves, this being obtained by means of a sliding cam shaft. Two systems of high tension ignition—magneto and accumulators—are provided. The clutch is of the internal leather-faced cone type, the pedal operating it being so connected up to the variable lift device to the inlet valves that as the clutch is withdrawn the speed of the engine is automatically cut down. The gear-box, the shafts of which run on ball-bearings, gives three speeds forward and a reverse, with direct drive on top speed. Fig. 54, gives a sectional view of the live axle, which, as will be seen, runs on ball bearings. Altogether the Brown cars, without comprising any radical departure from what may be termed standard practice, are of sound and reliable construction.

### The Renault Cars.

Considerable interest was shown in the 105-h.p. racer shown by Messrs. RENAULT FRERES, and which was driven to victory in the Grand Prix contest this year by Sizé. The pleasure cars on view included an 8-9-h.p. single-cylinder cab of the type of which a large number is about to be put in service in London, a 10-14-h.p. landaulet, a 14-20-h.p. with similar body, a 20-30-h.p. chassis, and a 35-45-h.p. with special limousine by Messrs. Joseph Cockshoot and Co., of Manchester. Slight modifications have been made in the radiator, which is still located in front of the dashboard, and in the automatic carburettor. The two larger models are also now being fitted with a change-speed gear of the sliding pinion type.

### The Morgan Cars.

There are quite a number of special features in the 24-28-h.p. Morgan cars exhibited by Messrs. MORGAN and CO., LTD. The engine comprises four cylinders,  $4\frac{1}{2}$  in. bore by  $5\frac{1}{2}$  in. stroke. The cylinders are cast separately, with ample water jackets, particularly round the valve chambers. The valves are arranged on opposite sides of the engine, and are all interchangeable. There are two ignitions, magneto and

Fig. 54.—Sectional Plan of live axle on the Brown 20-22-h.p. Car.

accumulator, and both are advanced and retarded by a lever on the steering wheel. In addition to many other improvements, the engine is fitted with a variable lift, of simple design, also with a special carburettor. The main features of the latter are that no float-feed chamber or jet are employed. The petrol flows from a small auxiliary tank, in which it is maintained at a constant level from the main supply, straight into a large annular pipe, which also forms the main air inlet. Petrol and air descend together, and pass out into a chamber through specially-cut orifices, which impart to the mixture a rotary motion. The carburetted air is drawn up through the suction pipe, which is placed concentrically in the pipe forming the main air inlet.

An automatic valve, controlled by the suction of the engine, is fitted, in order to regulate the size of the orifice through which the petrol flows. Transmission is through a leather-faced cone clutch, four-speed gear-box with "gate" control, and thence by a cardan shaft and bevel gear to a rear live axle. The carriage bodies exhibited by this firm were worthy of special notice. One car was fitted with a limousine with a movable top and seating accommodation for seven persons, all facing forward. A second vehicle was provided with a patent landaulet body, which can quickly be converted into a perfect open carriage. The new Cromwell roller hood, invented by Major Samuel, who was also responsible for the design of the Cromwell wind screen shown with it, was also a feature of the exhibit. The hood is carried on a ratchet roller in a box stretched across the rear of the car. This box is large enough to contain the whole of the supports and curtains, so that everything can, if desired, be stowed away out of sight.

### The Germain Car.

The display of Capt. THEO MASUI was entirely confined to the well-known Germain chainless 14-h.p. cars, which have given such satisfaction in practice that the changes for next year are being confined to matters of detail. The leading feature of the car is, of course, the engine, which has four separate steel cylinders with brass water jackets. The inlet valves, which are operated off their own cam shaft, have a variable lift controlled from the steering wheel. The transmission is through a gear-box giving three speeds forward and a reverse, cardan shaft and bevel gear to a well-designed back axle. The complete cars on view were worthy of careful notice. Fig. 55 depicts the 14-h.p. landaulet with body by Van den Plas, of Brussels; it is painted blue, and is fitted with electric light inside. A neat tyre carrier is also provided. A well-

Fig. 55.—The Germain 14-22-h.p. Landaulet.

designed double phaeton with canopy, specially designed for service in India, was also shown, the usual front glass screen being replaced by one of wire gauze to prevent the passengers being annoyed by flies and mosquitoes.

### The Minerva Six-Cylinder Car.

The exhibit of Messrs. ERNEST ARNOTT and HOLLOWAY, LTD., was confined to a display of the new 40-h.p. Minerva six-cylinder cars, which, by reason of their excellent design and sound construction, attracted considerable notice. The cylinders are cast in pairs, with the valves arranged on opposite sides; the dimensions are—bore, 105 mm., and stroke 120 mm. The crank shaft is *desaxe*, that is to say, it is set slightly to one side of the centre of the cylinders. Dual ignition is provided—high tension magneto and coil and accumulators. The mixture is furnished by an automatic carburettor, and we noted that the inlet pipes are so arranged that the distance between the carburettor and each of the explosion chambers is practically the same, so that each get an equal charge. The speed of the engine is controlled by both hand and foot levers. A noteworthy feature of this large car is that the water circulation is on the thermo-syphon system, no pump being employed. The pipes are of large diameter, while the radiator, which is of framed ribbed tube type with fan, is of ample size. The clutch is of the leather-faced cone type, with cork insertions, and the gear-box, which is operated by a "gate" lever, gives three forward speeds and a reverse, with direct drive on top. The drive is by a cardan shaft and bevel gear to a live axle. The cardan shaft, which has a single universal joint, is entirely enclosed, while the rear axle, which has only the driving strain to withstand, and

does not carry the weight of the car, conveys the power to the hubs of the rear wheels through the squared ends. Except on the engines, ball bearings are employed throughout. The usual longitudinal springs are supplemented by a transverse one at the rear. The complete cars on view included a limousine and a landaulet, both having accommodation for seven persons.

#### The Westminster Car.

With the view of meeting the demand for a four-cylinder car at a moderate price, the Westminster Motor Works have recently introduced

these mesh with corresponding bevel pinions on the end of the gear shaft, either pair being made to drive by means of clutches. A special form of automatic carburettor is employed on these cars; it is so arranged that the petrol supply can be entirely cut off, and cold air admitted direct to the cylinders.

#### The "British" Cars.

Three types of the "British" cars were exhibited by the BRITISH MOTOR AND ENGINEERING CO., LTD., all being relatively low in price

Fig. 56.—The Westminster 10-h.p. Four-cylinder Car.

the vehicle illustrated on Fig. 56, and one of which was exhibited on the stand of Messrs. F. M. RUSSELL and Co. The engine, which develops 10 h.p., has all the four cylinders in one casting; the bore is 76 mm. and the stroke 90 mm. Dual ignition is fitted—magneto and accumulators—and the mixture is furnished by a Longuemare carburettor. The transmission is through a leather-faced cone clutch to a gear-box giving three speeds forward and a reverse, with a direct drive on top speed. The final drive is by a cardan shaft and bevel gear to a live axle. The frame is provided with a transverse spring at the rear, in addition to the usual longitudinal ones. The usual foot and hand controlled brakes are

so that they should meet the requirements of a large clientele. The 7-h.p. two-seated vehicle, which has a wheel base of 6 ft. 8 in., is fitted with a 7-h.p. twin-cylinder engine having mechanically-operated valves with variable lifts to the inlets. Water circulation is by gear-driven pump. Three forward and reverse gears are provided, the top speed being direct to the live axle. A more powerful car was seen in a 14-h.p. vehicle (Fig. 57). This has a pressed steel frame, and has a Fafnir four-cylinder engine. Arrangements are, however, in hand to fit a motor of equal power, but of British manufacture. The clutch is of the leather-faced cone type; the gear-box, which gives three speeds

Fig. 57.—The British 14-h.p. Car.

provided, while the speed of the engine is regulated by means of levers on the steering wheel.

#### The De La Buire Cars.

Three sizes of the well-known De la Buire cars were shown by the HOLLINGDRAKE AUTOMOBILE COMPANY, LTD. A feature of the new 12-18 h.p. vehicle, which is of the live axle type, is that the four-cylinders are in one casting, with the valves arranged on opposite sides. The 15-20-h.p. car is chain driven, the change-speed gear being so arranged as to give a direct drive on the second and third speeds. This is obtained by means of two bevel wheels, concentric with each other;

and a reverse, is of special design, the pinions being always in mesh. One of the shafts is square, and has two sliding dog clutches upon it. These, upon being moved one way or the other, bring the three forward speeds and reverse into operation one at a time, as required. The changes are effected through the medium of a lever working in a "gate," in conjunction with which is a locking device, designed by Mr. A. E. S. Craig, which prevents the possibility of two speeds being in mesh at the same time. The lock is positive in action and works entirely without springs. A similar car, with landaulet body, by Vincent, of Reading, was also exhibited.

### The Spyker Cars.

Prominent on the stand of the BRITISH AUTOMOBILE COMMERCIAL SYNDICATE was a chassis of the latest type of 30-40-h.p. Spyker car, in which an effort has been made not only to render it free from dust-raising proclivities, but also of making it smokeless by preventing any chance of over-lubrication. The engine comprises four cylinders, 130 mm. bore by 130 mm. stroke, cast in two pairs, with the valves arranged on opposite sides. Large inspection doors are fitted to the base chamber. The circular honeycomb radiator is provided with an air-inducing fan mounted on a vertical pillar, fixed or screwed into the crank chamber; around the pillar is fitted a spring, which keeps the belt tight enough to drive the fan, and so does away with the necessity of tightening the belt. To facilitate the starting of the engine a half-compression lever is fitted in front of the radiator. The lubrication of the motor is effected by means of a cog wheel pump which draws the oil from a well formed at one end of the crank chamber and sprays it on the moving parts of the engine. Mr. Wellington informs us that it is only necessary to add half a pint of fresh lubricating oil daily for a run of 100 miles. At the end of each week the oil should be removed from the reservoir, and replaced with two pints of fresh, clean oil. The fittings on the dashboard are reduced to a simple switch and an oil-circulation gauge. Two systems of high tension ignition are provided—magneto and accumulators; the carburettor, which is of the automatic type, has been improved by the addition of a hand-controlled air inlet. The speed of the engine is controlled both by hand and foot levers. The clutch is of the leather-faced cone type, of large diameter. The gear-box is of new design, and gives three speeds forwards and one reverse, operated by a lever working in a "gate." The transmission is to a well-supported live axle through a cardan shaft and bevel gear; the weight of the car is carried on the axle-casing,

Fig. 58.—The Decauville 12-16-h.p. Car.

the live shafts within having only the driving strain to withstand, and transmitting the power to the hubs of the rear road wheels through the squared ends. A foot-brake is now also fitted in front as well as just behind the gear-box. These brakes are independent of one another, and both are operated by the same type of screw-nut mechanism that was formerly used for the single brake. Ball bearings are used throughout, and the usual four longitudinal springs are supplemented by a transverse one at the rear. Other Spyker cars on view included a 15-20-h.p. chassis, a 20-30-h.p. with special landaulet body by Meier, of Redhill, and a 20-30-h.p. double landaulet by the Victoria Carriage Works.

### The Wilkinson and Leander-Dixi Cars.

The WILKINSON SWORD COMPANY, LTD., who have lately taken up the construction of motor-cars, exhibited a 14-h.p. coupé, fitted with a four-cylinder engine, the power of which is transmitted through a special form of change-speed gear known as the Tacchi patent, and thence by cardan shaft and bevel gear to a live axle. The company have also taken up the agency for the Leander-Dixi cars, and exhibited a handsome 28-32-h.p. vehicle. This follows the standard lines of live-axle cars, the engine having the four cylinders cast in pairs, and the valves all actuated off a single cam shaft. The clutch is of the leather-faced cone type, and the change-speed gear is controlled by a lever working in a "gate."

### The Nagant-Hobson and Decauville Cars.

Interest at the stand of Messrs. H. M. HOBSON, LTD., was centred in the chassis of the new Nagant-Hobson 30-35-h.p. car (Fig. 59), which is built by the old-established engineering firm of Messrs. Nagant Freres, of Liege. The engine comprises four cylinders, 125 mm. bore by 140 mm. stroke, cast in two pairs, with the valves arranged on

Fig. 59.—Plan of Chassis of Nagant-Hobson 30-35-h.p. Car.

opposite sides. The ignition is by low tension magneto, provision being also made so that coil and accumulators may be employed as a reserve. A half-compression device is provided to facilitate the starting of the engine. The clutch is of the disc type, a neat clutch stop being provided to facilitate changing gear. The change-speed gear is adapted to give four forward speeds and a reverse with "gate" control and direct drive on the top speed, the final transmission being by side chains. Two brakes are provided on the differential shaft in addition to the usual internal expanding ones on the rear road wheels. The frame is of pressed steel and the front axle

Fig. 60.—Sectional Elevation of Nagant-Hobson Engine.

of I section, ball bearings being fitted to the pivots; in fact, to all parts except the engine. Altogether, the new car forms a noteworthy addition to the growing list of Belgian-built vehicles. Messrs. Hobson also exhibited a Decauville 12-16-h.p. double phaeton, and a 16-20-h.p., with special landaulet body by Messrs. Laurie and Maier. As regards the mechanical details of these well-known vehicles, they show little or no change from last year's models.

**The Adams and Adams-Hewitt Cars.**

A company which has come rapidly to the front during the past year or so is the ADAMS MANUFACTURING COMPANY, whose stand throughout the Show was a continuous source of attraction to visitors. Since we illustrated the 9-10-h.p. Adams-Hewitt car in the *M.C.J.* several improvements have been introduced; it is now fitted with a more conventional bonnet, in the front of which the radiator is set. The frame, which is now of pressed steel, has been

Fig. 61.—The Engine of the Star Six-Cylinder Car.  
(See *M.C.J.*, November 17th.)

lengthened, while the centre of gravity has been made slightly lower. The engine is of single cylinder horizontal type,  $4\frac{1}{2}$  in. bore by 6 in. stroke. The Adams standard automatic carburettor is employed to furnish the mixture, while the lubrication of the motor is effected by a positively driven pump. Two speeds forward and a reverse are provided by a change-speed mechanism which is of the epicyclic type, in which all the gears are always in mesh, and no teeth are cut on the external peripheries of the drums. The change of speed is effected by means of steel fibre-lined brakebands operating on the drums containing the pinions. The bands are controlled by three pedals, thus doing away with the necessity for side levers, and rendering the control so simple that it is

Fig. 62.—General view of the "Adams-Eight" Car.

possible for any person of average intelligence to learn to drive the car in one hour. The drive is transmitted to the rear wheels by means of a single roller chain of heavy type. Anti-friction conical roller bearings are used on both axles, the engine being fitted with ball bearings. The standard chassis is now being fitted with the following types of bodies: two-seater with movable seat at rear, which now faces forwards instead of in the opposite direction as on the 1906 cars; a mail phaeton, a four-seated side-entrance tonneau; a four-seated dog-cart; a traveller's sample car, and a 15 cwt. delivery van. A new type of car recently introduced

by this company is the Adams 12-14-h.p. the one exhibited being provided with a landaulet body. The engine comprises two vertical cylinders, 105 mm. bore by 115 mm. stroke. The valves are operated off one cam shaft, a leading feature being that all the details of the motor are self-contained. The water circulating pump, which is of the cog-wheel type, is operated by a combination spring and chain drive, provision for adjusting the latter being made. Two systems of ignition can be provided, accumulators and coil or high tension magneto, each system being controlled by its own lever at the steering wheel. The bonnet is of similar pattern to that used on the light car, and, of course, in this case encloses the engine. The change speed mechanism is adapted to give three speeds forward and a reverse; it is of the epicyclic type, and is identical with that on the 9-10-h.p. car except for the addition of an extra drum and band and another pair of wheels. So far as the operating gear is concerned, the number of pedals remains the same; there is, in addition, however, just behind the low speed pedal, at convenient range, a small heel pedal. The method of changing speed is as follows:—With the engine running, the low speed pedal is pressed forward to its full limit, so engaging the first speed. To change to the second speed, the pressure on the low speed pedal is released, and the heel pedal situated just behind it depressed, the low speed pedal then pressed forward still further, when it will drop into a catch and the second speed will be engaged. To get on to the high speed, the high speed pedal is pushed forward, the second speed being automatically released. A long cardan shaft connects the change-speed gear to the live axle. The chief centre of attraction at the stand was undoubtedly the chassis of the "Adams-Eight," the 35-40-h.p. car (Figs. 63 and 64). This is fitted with the Antoinette eight-cylinder engine, which is now being made by the firm at their Redford works. The separately cast cylinders are arranged

Figs. 63 and 64.—Elevation and Plan of the "Adams-Eight" Car.

in two sets of four at an angle of forty-five degrees; the dimensions are 105 mm. bore by 115 mm. stroke. The valves are all on the inside, and operated from a common cam-shaft, driven by fibre pinions at the rear end. The inlet and exhaust pipes are neatly arranged, the former being brought above the engine and the latter below, while a single dog and nut on each cylinder secures them to the valve chambers. Both high-tension magneto and accumulator ignition are provided. The radiator is of the framed rubbed-tube type and is of a distinctive shape. The mixture is supplied by an Adams patent carburettor, giving positive regulation of the mixture at all loads and speeds; and the lubrication is effected by means of a special plunger type pump, also operated by the cam shaft. The epicyclic type of change-speed gear with two forward speeds and a reverse is also employed on this car. The drive to the live axle is by a cardan shaft with universal joints at either end, that at the rear being enclosed. A duplex torque rod is provided, while radius rods are fitted at each side. Three brakes are fitted, and irreversible worm and wheel type steering with ball joint connections. Fig. 62 gives a view of the "Adams-Eight" car fitted with a side-entrance touring body with hood and front glass screen. The Adams Company are so satisfied with the reliability of their cars, owing to the protection afforded by the system of interlocked pedals, that they have decided to issue to purchasers a free repair bond, which guarantees free repairs for the first six months after purchase of an Adams car, and covers even undue wear caused by inexperienced driving.

The Southall tyre gauge made by Mr. H. W. SOUTHALL, of 7, Union Passage, Birmingham, was shown on several stands. This gauge registers the air in the tyre, while there is a cut off arrangement to isolate the pump and permit the air in the tyre to get into direct communication with the gauge, the economy of price being another important feature in its favour.

### The Darracq Cars.

MESSRS. A. DARRACQ AND COMPANY had, as usual, a varied exhibit, ranging from a new two-seater to a 20-28-h.p. vehicle, all having transmission by a cardan shaft and bevel gear to a live axle. A feature of the new 8-10-h.p. two-seater car is the frame, which is of special design, the sides being extended upwards to form part of the body (Fig. 65). The engine comprises two cylinders, 90 mm. bore by 120 mm. stroke. The valves are mechanically operated and the carburettor is provided with an extra automatic air inlet. Some alteration has been made in the radiator, the ribbed tubes of which are placed vertically instead of horizontally. The change-speed gear gives three speeds forward and a reverse, with direct drive on top, controlled by a lever on the steering column. A

Fig. 65.—The New Pattern Steel Frame employed on the Darracq 8-10-h.p. Car.

10-12-h.p. double-phaeton was also exhibited; this vehicle, which is fitted with a twin-cylinder engine 100 mm. by 120 mm. stroke, shows but few changes as regards the mechanical details. The frame has, however, been slightly increased in width to allow more room in the body. Principal interest at this stand was centred in the chassis of the new 20-28-h.p. car, in which several departures from the usual Darracq practice are embodied. The four cylinders, which are cast in pairs, are 112 mm. bore by 120 mm. stroke, the valves being all operated off a single cam shaft. The ignition is by coil and accumulators, although the motor is so arranged that a low-tension magneto can be added if desired. The clutch is of the leather-faced cone type, four flat springs being introduced under the leather to ensure a better grip. A universally jointed shaft connects the clutch with the gear-box. The latter is adapted to give four speeds forward and a reverse, controlled by a lever working in a "gate," this being an entirely new feature in Darracq cars. The clutch pedal is so connected to the throttle that as the clutch is withdrawn the speed of the engine is automatically cut down, and it may be added that ball-bearings are fitted to all parts except the engine. A car of similar power, but fitted with only three speeds, controlled by a lever working in a quadrant of the Panhard type, is also being made. Other Darracq models for 1907 which will first be seen at the Paris Salon include 7-9-h.p. and 8-10-h.p. single-cylinder, and 16-18-h.p. four-cylinder cars. A continuous centre of attraction at the Darracq stand was Mr. Lee Guinness's 200-h.p. eight-cylinder racer, on which so many records have recently been established.

### De Dion and Gladiator Cars.

The EASTBOURNE MOTOR WORKS, Eastbourne, showed a couple of the latest types of De Dion cars, an 8-h.p. with side entrance double phaeton body, and a 15-h.p. coupé. Messrs. MANN AND EGERTON, Ipswich, were present with an 18-h.p. Siddeley double landaulet, a 14-h.p. Gladiator side entrance double phaeton, and an 8-h.p. two-seater car specially designed for doctor's use; the bodies of all three cars are of the firm's own construction.

### The Courier and Robinson and Hole Cars.

A feature of the Courier cars, exhibited by the EUSTON MOTOR COMPANY, LTD., was the chassis of a new 8-h.p. two-seater four-cylinder car, which, in view of its relatively low price, will no doubt attract the attention of motorists of moderate means. The frame is of pressed steel; the four cylinders are cast in one piece, the bore being 70 mm. and the stroke 76 mm. Two high tension ignitions—magneto and accumulators—are provided, while the water circulation is on the thermo-siphon system. The clutch is of the metal-to-metal expanding type, contained in the gear-box; the latter gives three speeds and reverse; the gears are always in mesh, and the top speed is direct drive through the cardan shaft to the rear live axle, which, like the gear-box shafts, runs on ball bearings. The other Courier cars on view included an 18-24-h.p. four-cylinder vehicle, with double landaulet body by Mulliner, and a 24-30-h.p. side entrance double phaeton. The latter is fitted with a four-cylinder engine 110 mm. bore by 130 mm. stroke, three speeds and reverse, and direct drive on top speed to the live axle. At this stand was also to be seen a 16-20-h.p. four-cylinder car, built by Messrs. Robinson and Hole, Ltd., of Thames Ditton, for whom the Euston Company are agents. The vehicle, which made its first appearance at the Agricultural Hall Show in March last, bears evidence of both careful design and construction. The engine comprises four cylinders, 90 mm. bore by 110 mm. stroke, cast in pairs. The mixture is furnished by a special form of carburettor, in which the air and petrol supply is proportionately regulated. The clutch is of the leather-faced cone type, and the three-speed gear-box, which has "gate" control, gives a direct drive on the top speed to the rear live axle. Ball bearings, it may be added, are used throughout, except on the engine.

### The Mors Cars.

The MORS CO. have at last met the growing demand for live-axle cars by bringing out two new models, 10-h.p. and 15-h.p., and the chassis of the latter exhibited by Messrs. Mors, Ltd., was, naturally the centre of great attraction at this firm's stand. The vehicles are specially designed for use as town carriages; a feature of the engine is that

the four cylinders are all in one casting, the bore and stroke of the 15-h.p. being 85 mm. by 100 mm. The valves are all mechanically operated off a single cam shaft. The ignition is by high-tension magneto, while the lubrication is maintained by pump. Two large inspection plates are fitted to the under side of the crank case. Lubrication is by gear-driven pump working off a vertical shaft. The water pump is driven by a cross shaft set in front of the crank case, a coupling being provided to admit of easy detachment. A fan is placed behind the ribbed tube radiator, which is carried on a spring-supported bushing. A supplementary water tank is placed inside the bonnet on the dashboard. The contracting metal band type of clutch fitted on the 1906 Mors cars is still retained, certain improvements in the details having, however, been introduced. The change-speed gear is adapted to give three speeds forward and a reverse, with direct drive on top speed. The single controlling lever works in a "gate" quadrant. The cardan shaft is provided with a special form of universal joint, and the torque rod is carried at the front end in a spring box. The frame, which is of pressed steel, is raised at the back to clear the differential casing; the rear suspension is by means of three-quarter elliptic springs. Of the Mors chain-driven cars the exhibit comprised a 28-h.p. four-cylinder chassis, a 28-h.p. limousine, and a 17-h.p. landaulet. The body of the latter vehicle, which was built by the Relyante Motor Works, is of noteworthy design, containing as it does what is practically a vanishing suite of furniture. There are four tables for serving lunch, as in a Pullman, also a couple of chair seats which can be changed into beds for invalids or for camping tours. These all fold up instantaneously when not required, leaving a large clear floor space in front of the inside main seat. Everything is arranged to work automatically, and there is nothing to fix or to get out of order. The Mors Company are also introducing a 50-h.p. six-cylinder model, which will make its debut at the Paris Salon. A new hydraulic clutch known as B.J. was also exhibited on the Mors stand by the Hydraulic Clutch Company, Ltd. The device is in effect a rotary pump circulating oil within itself. The casing forms the fly-wheel of the engine, while the blade wheel is connected to the shaft which conveys the power to the gear-box. The power is transmitted from one to the other part of the clutch in proportion to the amount the oil delivery is throttled; when the latter is entirely closed the casing and the blade-wheel revolve at practically the same speed. The clutch is not only noiseless but it enables the engine to take up the load without shock.

### The Simms-Welbeck Cars.

Two new models of the Simms-Welbeck cars were shown by the SIMMS MANUFACTURING COMPANY, LTD.—20-25-h.p. four-cylinder and 30-35-h.p. six-cylinder—both of which are excellent examples of the rapid development that has taken place in the construction of automobiles in this country. Each vehicle has a pressed steel wood-lined frame carried on five springs, a transverse one being fitted at the rear of the chassis. The engines are in both cases similar except as regards the number of cylinders, the bore and stroke of both being 105 mm. by 125 mm. The cylinders are cast in pairs, and all the valves are arranged on the same side. The ignition is by the well-known Simms-Bosch

Fig. 66.—The Siddeley 30-h.p. Landaulet—a similar vehicle to the one the Wolseley Company are building for H.M. Queen Alexandra.  
(See page 845 last issue.)

high tension magneto. Special care has been given to simplicity and ease of control, one of the features of the new cars being the absence of unnecessary gear on the steering column and elsewhere, the speed of the engine being controlled by a pedal fitted with a neat form of adjustment. A feature of the carburettor is that the air inlet is correctly proportioned for all positions of the throttle, so that the action of the control pedal automatically gives the right quantity of air to ensure the best combustion. The water circulation is by means of a honeycomb radiator, pump, and a fan embodied in the engine flywheel. Lubrication is by pressure pump in conjunction with sight-feed lubricators. Attention may also be drawn to the large water and petrol filling holes provided to the radiator and fuel tank. A double universal joint is fitted on the shaft between the leather-faced cone clutch and the gear-box and is encased in a telescopic type of oil-tight cover which forms

an oil bath in which the joint runs. A three speed and reverse gear, operated on the "gate" principle, is provided, and transmits the power through an enclosed universal joint and propeller shaft to a live axle. The road wheels run on the casing surrounding the axle, the latter having dog clutches on its outer ends which engage with corresponding members in the hubs. All the bearings throughout the car, except those of the engine, are of the ball type. The complete cars on view comprised a highly-finished 30-35-h.p. six-cylinder limousine and a 20-25-h.p. landaulet, the latter being fitted with the Simms safety buffer.

#### The Speedwell Cars.

The new British built Speedwell cars which made their debut at the Show naturally attracted considerable attention. Three sizes are

Fig. 67.—View of Clutch and Change Gear Box on Speedwell Cars.

being built, viz., 10-12-h.p. three-cylinder, 25-h.p. four-cylinder, and 40-h.p. six-cylinder, all being of the cardan shaft driven type. Except where specially mentioned the following particulars may be taken as applying to all the different models. The engines have the cylinders cast in pairs, with the interchangeable valves all operated off a single cam shaft. The dimensions of the cylinders are: 10-12-h.p. 98 mm. by 130 and 25-h.p. and 40-h.p. (six-cylinder) 100 mm. bore by 130 mm. stroke. The base chamber can be dismantled without interfering with the crank shaft or clutch, allowing a ready inspection of all the internal parts. Except on the 10-12-h.p. car dual high tension ignition is provided, magneto and accumulators. The speed of the engine is controlled by two small vertical levers projecting from centre of the steering wheel and operating through Autolocs. The silencer is also of a new type; it consists of a long narrow cylinder, three openings being provided at the engine end of same, through which air is drawn in with the exhaust, the arrangement being claimed not only to reduce the noise, but also the back pressure. The magneto and water circulating pump are gear-driven, and the radiator is of the honeycomb type. The fan belt is kept at an even tension by means of a spring on the pillar supporting the upper pulley. As will be seen from Fig. 67, the clutch, which in the two large cars is of the multiple disc type running in oil, is contained in the gear-box, and attached direct to the main driving shaft, increasing its strength and securing alignment between clutch and gear. The plates of the clutch are self-separating, they immediately ceasing to grip as soon as the pressure of the spring is released, enabling a change of speed to take place quickly and without noise. The separation of the plates is effected automatically by means of spring tongues formed on each alternate plate. The gear-box is adapted to give three speeds forward and a reverse, with direct drive on top speed, the control being by a small lever working in a special form of "gate" quadrant. Another novel feature of the Speedwell cars is found in the rear axle, which is built up of two members, claimed to combine all the advantages of the chainless drive with the safety and strength of the solid forged steel axle. It is so arranged that the weight of the car is entirely borne by the lower axle, which is made of forged steel, and runs across from one wheel to the other without any break or joint. The wheels run on the ends of this axle, and no weight is thrown on the driving mechanism. The differential is mounted on this solid axle, through the bosses of which pass the live shafts which transmit the power to the road wheels by means of dog clutches. The whole of the driving gear can be dismantled without interfering with the wheels or jacking up the car; the differential case is made in two halves, parting horizontally, making the inspection of the crown bevel driving pinion and differential gear an easy matter; further, the gearing can be lifted out by simply drawing out the two driving shafts on either side by removing the wheel hub caps. The inner ends of the shafts are square in section, and fit in corresponding square holes in the side bevel wheels of the differential. The rear dumb irons are replaced by halves of semi-elliptic springs, and a special feature, which we hope to illustrate later, is the double pivoted spring shackles, which is claimed to allow the springs greater action without strain than when secured in the ordinary way. The bottom leaf of the portion which displaces the dumb iron is set inwards at right angles and curled round

to form a bearing for one of the bolts of the shackles. The pivots of the front wheels are fixed within the hubs so that they thus come in line with the point of contact of the tyre and road. Ball bearings are employed to all parts except the engine. The complete cars on view comprised a 10-12-h.p. three-seater, a 10-12-h.p. side entrance car (Fig. 69), a 25-h.p. double phaeton with canopy, and a 40-h.p. six-cylinder three-quarter landaulet. A feature of the 25-h.p. car is a cupboard extending across the whole width of the back of the body, and, with the door, forming the rear panel of the coach work; this cupboard (Fig. 68) is sufficiently large to take a tyre or a Stepney spare wheel, besides having plenty of space for spare inner tubes. Altogether the new Speedwell cars reflect great credit on their designer and should take a prominent position in the growing list of British-built vehicles.

#### The Aster Engines and Chassis.

Messrs. ASTER, LTD., had a big display in the Gallery of the well-known Aster engines, which are being made in sizes from 8½-h.p. single-cylinder to 80-h.p. four-cylinder. Among the changes and improvements that have been made we note that the centrifugal governor has been discarded, the speed of the engine being now controlled by hand and foot levers connected up to the throttle. The 12-14-h.p. two-cylinder and 14-h.p., 20-22-h.p., and 24-30-h.p. four-cylinder models are fitted with high-tension magnetos manufactured at the company's English works at Wembley. The 40-h.p. motor engine specially constructed for omnibuses and heavy lorries was also displayed. This is considerably stronger and heavier than previous Aster motors, its weight being about 7½ cwt., the bore 130 mm. and the stroke 140 mm. The crank shaft is carried on three bearings. The lubrication is effected automatically and under pressure, a pump worked by the motor by means of gear wheels forcing the oil into the crank shaft and from there to all parts of the engine. The gears, which are encased and run in oil, are entirely of metal. Included in the Gallery display was also a varied collection of motor components and accessories, including the Aster and Oleo sparking plugs, steering gears, change-speed gears, magnetos, and the Champion friction clutch of Messrs. Durham, Churchill, and Co. On another stand Messrs. ASTER exhibited two examples of the chassis they build for the trade; one was of 20-22-h.p. and the other of 24-30-h.p., both having side-chain transmission and ball bearings throughout. The engine embodies all the usual Aster features, the ignition being by high-tension magneto, with an auxiliary coil and accumulator. The radiator is fan-cooled, and a neat spring adjustment is provided for keeping the belt at the right tension. The lubricator, which is mounted on the dashboard, is novel, inasmuch as a hot water circulation pipe is carried through it, ensuring the oil being maintained in a liquid condition even in the coldest weather. The countershaft has its fixed brackets bolted up to the frame members, so that the whole can

Fig. 69.—The ingenious Spare Tyre Cupboard fitted to the Speedwell Cars.

be dropped without trouble. The foot brake is ingeniously adjusted by a wedge action, which obviates the use of screw mechanism. The rear brakes are internally expanding, and the usual screw adjustable radius rods linked to the frame are fitted.

#### The Calthorpe Cars.

THE CALTHORPE MOTOR COMPANY, LTD., had on view a 12-14-h.p. four-cylinder light touring car, fitted with side entrance body. The engine is a White and Poppe, the bore and stroke being respectively 80 mm. by 90 mm. The gear-box, of normal standard type, is fitted with three forward speeds and reverse. The clutch is the well-known

Hele-Shaw metal-to-metal, running in oil. A Longuemare carburettor is fitted, and all control levers are worked from the top of the steering wheel. The other model shown by this firm was a 28-40-h.p. four-cylinder landaulet. The engine of this car is also a White and Poppe make, having a bore and stroke of 110 mm. by 120 mm. Both cars are of the live-axle type.

bearing between each cylinder. A noteworthy feature of the design is that the water circulation is on the thermo-syphon system, large diameter pipes being employed, but no pump. The honeycomb radiator, which is provided with a fan, is of a large size and is mounted on pivots in such a way that no strains are transmitted to it by any distortion of the frame due to bad roads.

Fig. 69.—The Speedwell 1C-12-h.p. Side Entrance Double Phaeton.

#### The Belsize Cars.

One of the oldest firms in the trade in this country, BELSIZE MOTORS, LTD., had an exhibit which fully demonstrated the great progress this concern has made in the construction of automobiles. The great centre of interest was, of course, the chassis of the Belsize 60-h.p. six-cylinder car (Fig. 70), the design throughout being of a striking character. The cylinders are cast in three pairs, the bore and stroke being respectively 5 in. by 5 in.; the valves are all located in the cylinder

The high-tension ignition is in duplicate, magnet and accumulator, the latter having a single trembler coil and a synchronised high-tension distributor. The lubrication of the engine is effected by a dredger-type oiler on the dashboard. The clutch, which is of the Hele-Shaw disc type, is connected to the gear-box by a jointed shaft. Three speeds forward and a reverse are provided; on the top speed the drive is direct, the side shaft in the gear-box being out of operation. The transmission is by cardan shaft and bevel gear to a live axle, on the tapered ends of which the road wheels are keyed; the weight of the car

Fig. 70.—Chassis of the Belsize 60-h.p. Six-Cylinder Car.

heads and are directly operated off an overhead cam shaft. Both the inlets and exhaust valves are provided with two lifts, this being obtained by means of a sliding cam shaft, so as to bring a different profile of the cam over the valve tappets. This is controlled by a lever on the dashboard, and enables the speed of the engine to be regulated and also facilitates the starting operation by altering the lift of the exhaust valve and so lowering the compression. The crank shaft has a

being carried on the axle casing. The control of the brakes is the reverse of that usually adopted, the pedal being connected up to those acting on the drums connected with the rear road wheels, and a hand lever works the brake on the shaft at the rear of the gear-box. The Belsize Co. also exhibited a 30-h.p. six-cylinder limousine and a 20-h.p. four-cylinder double phaeton, a feature of the latter being the relatively low price at which it is offered.

**Motor-car Frames.**

Although not lending themselves to picturesqueness, the exhibits of Messrs. RUBERY, OWEN AND CO. were not without their attractions to motorists who are inclined to pay some regard to the materials of which their vehicles are constructed. The firm's hydraulic and pneumatic plant gives them special facilities for the production of pressed and rolled channel motor-car, van, omnibus, and wagon frames in mild or nickel steel. They showed some excellent mild steel forgings, as well as bolts and nuts, castellated nuts, &c., and generally demonstrated the excellence of their steelwork.

**Dunhill's Motorities.**

The space available for the display of the large range of motorities associated with the name of Messrs. ALFRED DUNHILL, LTD., scarcely seemed adequate for the very comprehensive selection of goods they can stage.

Fig. 71.

In leather garments alone they had a splendid selection, the examples of leather clothing for lady motorists being particularly noticeable. The new "Pluiette" veil and hood was exhibited for the first time and should secure comfort in wear as well as complete protection from rain. It is made of a gossamer-like material, thoroughly waterproof and dustproof, and fitted with a mica window. For gentlemen there were several exhibits embodying new ideas, a combined town and motoring overcoat being particularly attractive. This has a smart double-breasted front, and at the rear are two pleats which close when walking and open when the wearer is seated. Leather suits and liveries were also conspicuous on this stand. The accessory section was very complete. Here were lamps of varied designs, from the A.D.L. duplex lens headlight to small motor-cycle lamps. The A.D.L. lamp can be charged with water and carbide at the time the car is prepared for a run, and altogether it presents the necessary combination of effectiveness, simplicity and economy. A new dashboard fitting in the shape of a mirror with a universal joint and telescope adjustments, which enables the driver to keep an eye on the road behind him when passing through dangerous—from the police point of view—country was also shown, as well as the safety lamp for use in garages, made on the principle of the miner's Davy lamp, illustrated in Fig. 72. Foot rests, goggles, horns and syrens, &c., were to be seen on this stand, while a new idea in luggage boxes for cars attracted some notice. These can be covered with waterproof cloth to match the colour of the car, and shaped to fit any odd corners of the car, thus utilising all the space to the greatest possible advantage.

**Radiators.**

The Orme-Whitlock radiator, exhibited by Messrs. ORME, EVANS AND CO., LTD., of Wolverhampton, has long passed the experimental stage and may be mentioned as combining a large cooling surface, lightness in weight, and economy in price. It consists of a series of transversely corrugated tubes, extending between a top and bottom water tank. The corrugations of each tube are reversed with relation to the two tubes adjacent on either side, thus forming air cells from the front to the back of the radiator. Experience shows that the two or three gallons of water held by the radiator and jackets are sufficient to ensure adequate cooling, thus obviating the addition of water tanks. The radiator is made in sizes of 3 in. and 4 in. depth. Messrs. Orme, Evans and Co., Ltd., also had a collection of their petrol tanks, bonnets, wings, and other specialties in sheet metal work.

**Ubas Steel.**

Messrs. W. T. FLATHER, LTD., had an interesting collection of steels for motor-car construction. The firm have been engaged in this particular branch of industry for many years, and the enthusiasm of some of the principals for motoring has given them special knowledge of the requirements of motor-car makers. They showed forgings in "mild" and "medium" temper nickel steel, special nickel steel for case hardening, round, square, and hexagonal sections of bright-drawn mild steel; "Ubas" steel for case hardening for gear wheels, shafts, and bearings, as well as a series of tensile and torsion test pieces. "Ubas" steel has become well known in connection with gears, &c., and there was on view a gear which was recently tested on two teeth, with the result that they withstood a breaking load of 27 tons and 7.96 tons per inch width of tooth. In view of the necessity of using only the most reliable materials in motor-car work, such examples of strength are of considerable interest to those engaged in the industry, and a means of assurance to users of vehicles.

**Jacks, etc.**

By all concerned with the storage of automobiles—whether large motor-buses or small pleasure cars—the Adams' quick-lifting and transfer jacks shown by Messrs. ADAMS, PRICE AND CO., of Tunbridge Wells, had more than a cursory inspection. Garage owners will find the patterns A and B. of service in their daily work. These jacks have been mounted on wheels, and are capable of lifting by the front axle

any type of car for the purpose of cleaning, repairing, or removing the tyres. Another type is made to deal with heavy vehicles stored in restricted areas, and a series of elevators is also designed, by the use of which two men can easily and quickly load any type of motor-car on to trolleys. The adaptability of the Adams' speciality to various situations is a feature that has led to its introduction in the leading garages of the country, while its serviceability to private motorists is a matter of general recognition.

**Challiner's Detachable Rim.**

Challiner's patent detachable rim was the novelty at the stand of the SHREWSBURY AND CHALLINER TYRE COMPANY, LTD., whose wheels and tyres for heavy motor vehicles are well known. This rim can be easily detached in a minute or so by the removal of the nuts and bolts which hold it to the wheel. The tyre and rim are removed bodily, and the means of effecting this are so simple that there is nothing to interfere at any time with its ready removal when desired. The firm also showed a selection of their tyres for heavy and light motor vehicles, as well as of artillery motor-car wheels. In the manufacture of their pneumatic tyres, fitted with special compressed, wear-resisting, tough rubber treads, care is taken to meet the strain of wear on both the rubber and the canvas of the casing. The latter is often weakened through moisture, to obviate which the Shrewsbury and Challiner tyre is rendered waterproof to the maximum degree—a point of practical importance. The firm have a complete motor tyre repair department at their works at Ardwick Green, Manchester, and their facilities in connection therewith are considerably extending their clientele throughout the country.

**Exonite Steering Wheels.**

The Dover exonite steering wheel, which we described and illustrated in our report of last year's Stanley Show, as a novelty likely to attain a wide popularity, was to be found on many of the cars at Olympia. It also formed the feature of the exhibit of Messrs. DOVER, LTD. The metal handle is covered with the firm's "Exonite," which proves an admirable preparation for the purpose, being unaffected by the varying atmospheric conditions, and giving great durability in wear. Elegant in appearance, it is always clean in use. The steering wheel can be made with gun metal, aluminium, or other metal centres, the rims being rolled metal, wood, or aluminium, entirely covered with exonite. One pattern is made with a plain upper surface and ribbed on the lower side of the wheel, to enable a secure grip to be obtained. The other is in the form of a spiral rib, and secures an absolutely sure grip of the wheel. The Exonite steering wheel is rapidly attaining a large degree of popularity—certainly well deserved.

**Lamps.**

Messrs. WELDEN AND BLERIOT, Ltd., the English manufacturers of the Bleriot lamps, had a full range of their 1907 patterns in head lights, projectors, side lamps, tail lights, roof lamps, generators, &c.

Fig. 72.—The New Bleriot Head Light.

Among the novelties were their Parabolic head lights (Fig. 72) fitted with patent automatic shade, which many car owners will prefer to the ordinary patterns with a view to suppress the objectionable glare without reducing the power of the light on the road. The device is entirely under the control of the driver, who can instantaneously prevent the rays of light from shining forth directly ahead. All the different kinds of lenses now used in head lights (plano-convex, compound, and catadioptric) were also on view, as well as projectors in various sizes. The electric roof lamps and the various types of side lamps also demonstrated that the firm are maintaining their reputation. They also had on view three different types of generators, the most simple type working with "acetylithe," and two working with ordinary carbide, one of them being self-cleaning, so that it can be kept charged as long as required after turning off the light without waste of carbide. New pattern horns were also shown in various sizes.

**Lubricants.**

The STERN-SONNEBORN OIL COMPANY had a comprehensive selection of their lubricants for motor-cars and their parts. Motosternol oil for water-cooled cylinders, Sternoline elastic chain paste, and other specialties were shown, as well as one or two newer introductions which have already attained distinction. These include Saponal, for use in connection with screw-cutting and drilling, Sternonlip for belts, Clutcholine for clutches, and a rolling bearing grease. The high-grade quality of these productions has been often emphasised in previous show reports and it remains but to be said that the firm's reputation is being well maintained and extended.

### The Victoria Resilient Wheels.

In the Victoria Resilient Tread, introduced by the Industrial Improvements Company, Ltd., and shown on the stand of Messrs. H. M. HOBSON, LTD., is another effort to secure resiliency without pneumatics. The idea is certainly ingenious, and the principle of construction has the advantage that everything does not depend on the perfect behaviour of any other section. Attached to the rim of the wheel are twenty-four "elements" or sections, which constitute the wearing surface. Each consists of springs which have been tested to a pressure of 600 lb. to the square inch, and which hold a fabric into which pressure

Fig. 73.

the under surface of the tread. These are bolted to the rim in a continuous line, so that, although the principle of construction is segmental, the effect is continuous. Should any mishap—and that is unlikely—happen to any one of the segments the driver can still get home without worry. We hope shortly to put the device to a practical test. Meanwhile the section of the tread in Fig. 73 explains its construction, which seems well calculated to attain the purpose in view. In addition Messrs. H. M. Hobson, Ltd., showed the "Jenatzy" tyre and the "Jenatzy-Houben" non-skidding tyre.

### The "Grose" Leather Tread.

The original "Grose" leather tread was protected in 1897, and Messrs. GROSE, LTD., of Northampton, are able to point to the continuous growth of their business as evidence of its success, despite the number of rivals with which it has to contend for the favour of motorists. The tread itself is made of a special tannage of chrome leather and is fitted with a steel studded strip, which prevents skidding. The leather is formed into the exact curve of the tyre it is intended for, thus giving it a very neat appearance, a point upon which many users of such devices rightly insist. The protection afforded to the tyre makes it impossible for the damp to penetrate to the rubber, thus assisting to prolong its life. A combined "Grose" tyre and non-skid tread has been introduced with advantage, and has proved a great factor in the extension of business. These treads can be fitted to old covers, and much trade in that direction is being done by Messrs. Grose, Ltd.

### "Rub Metal" Non-Skids.

The new MOTOR AND GENERAL RUBBER COMPANY, LTD., which is now located at 374, Euston Road, N.W., and is in a good position to execute all classes of tyre repairs, showed the new "Rub-metal" non-skid tyre. The principle adopted is to have a specially tough rubber foundation overlapping the edges of the base of the tread, so that when vulcanised together the canvas fabric appears to be let into the tread. This principle of construction prevents the loss of resiliency and ensures a really durable non-skid. There are several thicknesses of canvas, and experience has proved the impossibility of the studs pulling away. They may be worn down, but that is all that happens. Even when this occurs the tread is serviceable and combines a non-skid with an ordinary wearing tread. These non-skids can be fitted to any covers, and the skill and experience which the New Motor and General Rubber Company combine in their work is the best guarantee of the excellent results.

### The "Stepney" Spare Wheel.

Considerable interest was taken in the presence of the Stepney spare motor wheel, which has the long experience of motorists to recommend it to those who have been attracted to such means of avoiding delays on the road caused by punctures and tyre troubles. The wheel has a steel rim of standard size carrying an ordinary beaded edge tyre fully inflated. This is conveyed on the car in the ordinary way, and should trouble arise with the tyres it is quickly fastened to the car wheel, and the motorist may go home without risk or delay. The damaged tyre can be repaired at leisure, and the vexatious experience of having

to see to the tyre on the roadside is obviated. Hence the value of the device to professional men and others to whom the keeping of appointments is a vital matter.

### The Lacre Accessories.

Very complete was the collection of motor clothing and accessories with which the LACRE MOTOR CAR COMPANY, LTD., occupied a stand in the gallery. Their "Torrent-proof" garments are of good design, being all made on their own premises and the variety of clothing both for ladies and gentlemen is of great extent. An important section of the exhibit was devoted to lamps—a department in which the Lacre Company have endeavoured to merit distinction. Their headlights are of bold outline and strongly constructed, while the light they give is extremely good. Acetylene head lights, paraffin side lights, and all other goods coming within that branch of the business, made up a good and effective display which was completed with a collection of accumulators, coils, non-skids and other devices, including the "Lacre" spare tyre brackets, an excellent fitting for those who have regard to the appearance of their cars when on the road.

THE ANGLO-AMERICAN OIL COMPANY, LTD., had an interesting exhibit of samples of the various products obtained from American crude petroleum, and by means of models and photographs illustrated the methods employed in importing and distributing Pratt's motor spirit, with which their name has so long been identified. Naturally their speciality does not lend itself to the picturesque side of an exhibition, but the literature issued from this stand recalled some very striking contests in which cars have been carried to victory on Pratt's motor spirit.

The firm of SALSBURY AND SON, LTD., exhibited their productions, and at the same time celebrated their centenary in the lamp business, the firm having been established in 1806. Among the specialities is a new type of head light, which is fitted with a lens mirror reflector, lens condenser, and semi-parabola reflector; it projects the light a long way ahead with a minimum glare to those approaching, and also gives the necessary wide angle light for side roads. Two head lights were shown of the Bullet type, as well as Searchlight and Ovalite lamps. A dissolved acetylene installation, in which the acetylene gas is carried in a steel cylinder, was also shown, together with the "Salsbury-Dietz" lamps and tail lamps. The Salsbury Pillar flash lamp is another neat fitment. It can be attached to any ordinary steering pillar by means of a band clip, and is fitted with a push button, so that the light can be thrown on the dashboard whenever required. A full line of accessories, such as jacks, petrol gauges, horns, and similar goods, completed the display.

### A New Tyre Inflator.

A large selection of accessories and spare parts was shown by Messrs. BROWN BROS., whose specialities now include the new automatic tyre inflator illustrated in Fig. 74, and which they are introducing to the public at this Show. This is known as Maxfield's auto-tyre inflator, and can easily be fixed to any car. It comprises two parts only, viz., an air compressor and an air chamber from which the air is carried by a

Fig. 74.—Maxfield's Tyre Inflator.

flexible tube to any tyre at pleasure. The compressor is arranged to be driven by friction off the flywheel or clutch of the motor. The bearings and compressor are made of phosphor bronze, and the spindles of hardened steel, which ensures smoothness of running and great durability. By the use of this well-made device a 815 mm. by 105 mm. tyre can be inflated in a couple of minutes, and various tests which have been applied prove it to be reliable as well as automatic in operation.

**Messrs. J. Wilson Browne's Lamps**

On the stand occupied by Mr. E. J. HARDY, of Coventry, was a good selection of lamps bearing the name "Unedallite." These are the production of Messrs. J. Wilson Browne and Son, of Ludgate Hill, Birmingham, and include side lights for cars or motor-buses; head lights, tail lights, and, in fact, every variety of lamp required by motorists, on land or on sea. The "Unedallite" reflecting tail lamp is designed to reflect the light on the number-plate as well as on the road, and is well made to withstand the inconvenient consequences of lights being shaken out. The lens on the side of the lamp will reflect the light right across the road to the hedge, and the device being fitted with a Barton burner to burn petroleum may be relied upon. In the acetylene headlight, with separate generator, is a good type of lamp. The generator is on the diving bell principle, and is quite automatic in its working, being capable of giving off gas the moment the tap is turned on. These lamps are well and strongly made, and their presence at Olympia recalled the very representative show made by Messrs. J. Wilson Browne and Son at the Agricultural Hall in the spring.

**Radiators, Lubricators, etc.**

The DOHERTY MOTOR COMPONENTS, LTD., of Coventry, may always be trusted to make a display fully typical of British excellence of workmanship. They showed some good patterns of lubricators, including those with oil distributors for use with separate pressure feed tanks, and mechanical feed lubricators. The firm's radiators were a distinctive feature of the stand, special importance being given to the tubular form, which has the appearance of the honeycomb type. The maximum of strength and cooling surface is ensured without any sacrifice of good appearance. A number of narrow flat metal strips are fitted horizontally into the vertical edges of the gilled plates, which are folded over to present a thicker edge. They are also slotted to enable the horizontal strips to be properly fitted. Radiators and bonnets for industrial vehicles are a special line with the Doherty Company, which has secured a good place among manufacturers of such necessary parts.

**The Rushmore Lamps.**

At the stand of Messrs. LOVEGROVE and Co. were many notable motoring requisites. The Rushmore lamp was a conspicuous attraction. This is being introduced to British motorists by Messrs. Rushmore Lamps, Ltd., of Rupert Street, London, W., who are the sole agents for Great Britain and Ireland. The lamp, which has long been popular in the United States, is based upon the substitution of an aplanatic lens mirror for the metal reflector; and projects a large percentage of the light where it is most needed by the driver of a motor-car, viz., far along the road ahead, while the part near the vehicle is illumined only by the small amount of light coming directly from the front of the flame. Hence there is sufficient light for the driver to keep an eye on obstructions noted when at a greater distance therefrom, but the searchlight will not annoy drivers coming the other way after they are within a hundred feet or so or on one side of the main beam. Claiming these important advantages, the Rushmore lamp is made in various sizes adapted for the different requirements of users. The lens mirror searchlight is of similar construction to those made for the United States Navy. Fitted with side sockets for slipping upon the ordinary fork brackets of the car, it presents a good appearance, the cylinder and fittings being of brass and the front door and the rear cover being of heavy copper. A swing bracket searchlight is also supplied. This is suspended in a swinging U frame with a bracket for mounting on a flat vertical dashboard, and will be specially appreciated by those who attain a high rate of speed. The Flare Front Lens Mirror Searchlight is another adaptation of the principle, but the lamp has a large flaring front permitting more light directly from the flame to strike the road just in front of the car. The coming of the Rushmore lamp to this country is a matter of considerable concern to motorists, who will not be slow to appreciate the value of the aplanatic lens mirror in securing such an excellent effect.

**Bowden Specialities.**

The BOWDEN PATENTS SYNDICATE, LTD., showed a complete assortment of their various devices and adaptations of the Bowden wire mechanism for the use of motorists. Among the most interesting of these was the new Bowden Mileage Recorder, an ingenious adaptation of the Bowden wire which enables the mileage to be read with ease while driving, or from any other position inside or outside the car desired. Another interesting novelty was the Bowden Petrol Strainer. There was also the Bowden Agitator for Carburettors, by means of which the task of handling the bonnet of the car for the purpose of flooding the carburettor prior to making a start is obviated. This consists of a length of Bowden wire mechanism, with a push button at one end and a device for depressing the float at the other. The former is brought to a point adjacent to the starting handle, so that it can be operated before a turn is given to the starting handle. The means of securing an additional air inlet in connection with the carburettor, which was described and illustrated in our issue of October 6th, was also on view at this stand, attracting much notice from motorists.

**Parsons Non-Skids and Inflators.**

The new type of the Parsons non-skid, illustrated in the *M.C.J.* on September 22nd, was shown by the PARSONS NON-SKID COMPANY, LTD. This is known as the "Parsons Grippa." The side hoops are of chain, and are fastened with a simple yet safe snap coupling. The cross chains now run straight across from hoop to hoop, thus facilitating attachment and detachment, and enabling reductions to be made in both weight and

price. The Parsons Sparklet inflators were also shown. By means of these tyres can be inflated more rapidly and more evenly than has hitherto been the case, the whole operation being accomplished in a minute or so. In connection with the safety of the cylinders employed in the sparklets the company drew attention to a test made on the 17th ult., by Mr. A. H. Wheeler, who is well known in connection with the granite quarries of Carnarvonshire. He had had the cylinder thrown five times over a precipice about 200 feet high on to some large granite boulders, and on these occasions the only result was to "dinge" and scar the tube, the dust cap being also broken off. After throwing the cylinder over the cliff for the sixth time he found more dents in the tube, and found that the plug to which the valve is screwed was leaking, but so slightly that it took more than four hours to empty the cylinder. Such a result demonstrates the safety of the apparatus, and is a testimony to its strength.

**The Windham Motor Body.**

On the stand of Messrs. Sayers and Co., the WINDHAM SLIDING DETACHABLE MOTOR BODY COMPANY had a demonstration of the value of their invention, which consists in building a body on the usual lines with the exception that the floor and framework of the back part of the body is so constructed that it allows this portion to be slid on and off as necessary, leaving the front seats and wings intact. Then the body intended to be placed on the chassis can be pushed on, automatically locking itself to the chassis in the process. On a previous occasion we commented favourably on the idea, which secures such economies to the motorist who uses a motor-car for various purposes.

**Miscellaneous.**

On the stand of the United Motor Industries, Ltd., which was, as usual of considerable interest, was a new speed indicator, which is being placed on the market by Messrs. EVERETT, EDGEUMBE AND CO., LTD., of 87, Victoria Street, Westminster, S.W. Briefly mentioned, it combines a distance recorder with a mileage indicator, and is conspicuous by the ease of adjustment and absence of complicated parts.

MESSRS. LAKE AND ELLIOT, of Braintree, had their usual complete selection of Millenium jacks for motor-cars. These give a long extension in the minimum space and are made in a range of four types for different classes of cars. Castings and engineers' tools, as well as complete tool kits, were also on the stand.

MESSRS. CANN, LTD., showed the double and single White steam landaulets which won the Gold Medal in the recent Town Carriage Competition of the A.C.G.B.I. Another double landaulet made for the 30-h.p. White steam car was upholstered in Bedford cord. Both the large vehicles had the new registered model front boot, which gives an extremely graceful appearance to the front of the landaulet.

Honeycomb radiators, bonnets, petrol tanks, wings, &c., of good design and construction formed the exhibit of Messrs. JOHN MARSTON, LTD., in the Gallery.

Among the insurance companies who took advantage of the occasion to bring their special policies for motor-cars before the public were the Car and General Insurance Corporation, Ltd., which also deals with all accident and third party insurances; the General Accident Fire and Life Assurance Corporation, Ltd., which has its headquarters at Perth; and the International Motor Insurance Company, Ltd.

Motor tyres in three different patterns were shown by the CONTINENTAL TYRE AND RUBBER COMPANY (GREAT BRITAIN), LTD.—viz., round tread, square tread, and with red rubber steel-armoured non-skids. The latter tyres are manufactured with a grey rubber tread with red rubber sides, the rivets being supported by the "Continental" patent discs, enabling the cover to be driven until the tread is completely worn out without the studs becoming loose or the cover defective. Those associated with the heavier type of automobile were interested in the very large pneumatic tyre for motor buses, as well as by two kinds of solid tyres for such vehicles.

PRICE'S PATENT CANDLE COMPANY, LTD., showed a full range of standard lubricating oils, giving prominence to the oils which were used with success in the recent Tourist Trophy trials. New lubricants were shown for engines, gearing, and bearing, specially suited to the motor-buses which now play such a prominent part in public traffic. "Manulan," "Curroleum," and "Cirogene" were other familiar specialities at this stand. In order to overcome the difficulties which motorists have experienced regarding the quality of the oils which they purchase, Messrs. Price's Patent Candle Company, Ltd., have adopted, and exhibited for the first time, a new pattern of enamelled and sealed tin which will enable them to offer to all their customers the assurance that while the seal is unbroken the contents of the tin are genuine.

From Wakefield came the SEAMLESS STEEL BOAT COMPANY, LTD. with a pressed steel car frame and minor other specimens of their pressing.

MESSRS. D. BROWN AND SONS, LTD., of the Park Works, Huddersfield, make their debut at automobile exhibitions with a selection of their machine-cut gears for motor-cars. They have an extensive connection among the leading makers, and specimens of their work were to be seen on many of the cars in the Exhibition.

Woven glass accumulators, induction coils, low tension and high tension magnetos, voltmeters, and ampere meters are among the electrical specialities shown by Messrs. VAN RADEN AND CO., LTD., whose reputation for this class of work is well established.

(To be concluded.)

## THE STANLEY SHOW.

THE thirtieth Stanley Show opened at the Royal Agricultural Hall, London, on Friday of last week, being inaugurated by Sir Albert Rollit. It has continued throughout the week, and closes to-day (Saturday). Although the automobile exhibits are not numerous, they are not without interest, as may be gleaned from the perusal of the notes that follow:—

### The Porthos Cars.

A new car of French construction, and known as the "Porthos," is exhibited by the MARLBORO' MOTOR AND ACCESSORIES COMPANY. Generally speaking the vehicle follows the usual lines of chainless cars, although in the details some departures are made from the standard practice, particularly as regards the design of the live axle. The engine, which is rated at 25-30-h.p., comprises four separate cylinders with the valves arranged on opposite sides. Two systems of high tension ignition—magneto and accumulators—are provided, and the mixture is furnished by an automatic carburettor. The clutch is of the leather-faced type and the gear is adapted to give four forward speeds in addition to the reverse. The brakes are all of the internal-expanding

the axle, the weight of the car being carried by the sleeve. The gear-box is provided with three point suspension, the side supports being pivoted so that any strains to which the frame may be subjected are not transmitted to the driving mechanism. The cardan shaft, which has only one universal point at the forward end, is enclosed in a casing. The usual dumb irons at the rear are replaced by halves of semi-elliptical springs. We may add that ball bearings are used throughout except the engine, and that the wheel base is 10 ft. 3 in., permitting any type of carriage body to be fitted to the chassis. At this stand is also to be seen the most powerful car in the Show—a 40-50-h.p. Florentia chain-driven chassis. The engine differs from that in the 18-24-h.p. model in that the cylinders, which are 140 mm. bore by 160 mm. stroke, are separately cast and that the ignition is by low tension magneto. The frame, too, is worthy of notice; this is of pressed steel, with the cross members electrically welded in place, no rivets being employed. The clutch is of the expanding metal type; the female portion is not built rigidly with the flywheel as usual, but is connected to the latter by four studs. The petrol is pressure-fed from the main reservoir at the rear to a small tank on the dashboard. The latter always contains sufficient spirit to run the engine and consequently to maintain the pressure in the main tank, the usual initial hand-pumping being in this way dispensed with. The braking system is extremely powerful; on the differential shaft are two wide contracting brakes, while a hand lever at the side of the

Figs. 1 and 2—Elevation and Plan of the Florentia 40-h.p. Car.

ing variety and the rear springs are three-quarter elliptic. One of the cars on view is fitted with a limousine body and the other is a side-entrance double phaeton.

### The Florentia Cars.

The new firm of Messrs. M. DE BROU AND CO., LTD., make their first public appearance with a polished chassis of the latest type of Florentia 18-24-h.p. car. The vehicle is of Italian construction, and, like the majority of cars which reach us from that country, is of high grade construction. The pressed steel frame is narrowed in front to increase the lock of the steering wheels. The four cylinders, which are cast in two pairs, are 100 mm. bore by 140 mm. stroke. The valves are located on opposite sides, and the ignition is by high-tension magneto. The latter, as well as the water circulating pump, is driven by enclosed gear wheels. The mixture is furnished by a special design of automatic carburettor with hot water jacket. The radiator is of the honeycomb type, air being induced through the same, by a fan formed in the flywheel. The clutch is of the expanding metal-to-metal type, and the shaft connecting it with the gear-box provided with a joint to allow for any want of alignment between the two parts, and also to permit of either being dismounted without disturbing the other. The change-speed gear, which is controlled by a lever working in a "gate," is adapted to give four speeds forward and a reverse with direct drive on top speed; the final transmission is by a cardan shaft and bevel gear to a live axle; the latter has only the driving strain to withstand, the drive to the rear wheel hubs being by the square ends of

driver actuates internal expanding brakes working inside drums attached to the rear road wheels.

### The Clyde Cars.

Mr. G. H. WAIT, of Leicester, exhibits a couple of Clyde 8-9-h.p. double-cylinder cars, one being fitted with a two-seated body and the other with a side-entrance double phaeton. While the general design is unaltered, several improvements have been made in the details with the view of keeping the vehicles well up-to-date and of giving them a pleasing appearance; thus we note that push pedals have been adopted as well as "gate" control, and that a Daimler type of curved dashboard is now being fitted. The engine, which is a double-cylinder White and Poppe, is arranged with its crank shaft parallel to the axles, it being thus fixed at right angles to the usual position. The exhaust gases on reaching the silencer pass through a large expansion chamber, and a special fitting is seen in a device for flooding the carburettor to facilitate starting, without it being necessary to open the bonnet. The transmission in the Clyde cars is on novel lines, and that it is efficient is demonstrated by the success achieved in several of the hill-climbing competitions held in Leicestershire during the past season. The change-speed gear is enclosed in a box which also surrounds a differential on the rear live axle; it is adapted to give three speeds forward and a reverse; the pinions are always in mesh, one set being loosely mounted together with the dog clutches, by means of which they are made to transmit the power, on a short shaft carried parallel to the rear axle. The latter carries the fixed train on

pinions, the usual gear-box side shaft being thus dispensed with. The connection between the engine and the one end of the tubular frame and the gear-box at the other is by an enclosed Renold silent chain, with a three to one reduction. The clutch, which is of the metal-to-metal type, is located within the chain wheel on the outer end of the gear-box.

#### The Starling and Stuart Cars.

The popular little "Starling" 6-h.p. single-cylinder cars are again a feature of the STAR CYCLE COMPANY'S exhibit. These two-seated vehicles have three speeds forward and a reverse, with direct drive on top speed, the transmission being by chains. A number of detail im-

Fig. 3.—The Stuart Car.

provements have been introduced, while the wire wheels have been superseded by those of the artillery type. The novelty at the stand is the range of the new "Stuart" cars fitted with either two, three or four-seated bodies. The frame of these vehicles is of the armoured wood type. The motive power is supplied by a 7-h.p. twin-cylinder engine, the bore and stroke being respectively  $3\frac{3}{8}$  in. and 4 in. All the valves are mechanically operated, and a governor with a cut-out pedal is provided. The mixture is furnished by an automatic carburettor; ignition, which is controlled by a lever on the dashboard, is by coil and accumulators, and the water circulation by a friction-driven pump and radiator with fan. The clutch is of large dimensions, and very easy to adjust; it is of the cone type with three springs and is provided with a ball thrust bearing. The gear-box is adapted to give three forward speeds, the top being direct, and the reverse so arranged as to remain idle except when in actual operation. The final drive is by a cardan shaft and bevel gear to a live axle, the latter as well as the gear-box shafts running on ball bearings. The wheelbase is 7 ft. and the road wheels are shod with 700 by 85 mm. tyres. We note that long footboards replace the small iron steps usually fitted to give access to the vehicle. Designed to meet the requirements of motorists of moderate means, the new Stuart cars form a noteworthy addition to the list of popular-priced vehicles; they are of sound construction, and, judging from our inspection, should give excellent results in practice.

#### The New Eagle Cars.

There are a number of special features in the new Eagle cars exhibited by the ST. GEORGE'S MOTOR CAR COMPANY, of Leeds. This is the first time these cars, which are built to the designs of Mr. Ralph Jackson, have been publicly shown, and the excellent performance made by one of them in the recent speed trials at Blackpool render them worthy of more than passing notice. The frame is of wood and steel construction; the engine, of the 24-30-h.p. model, comprises four cylinders, 110 mm. bore by 130 mm. stroke, cast in two pairs, with the valves arranged on opposite sides. The half-time wheels, governor, &c., are located at the

Fig. 4.—The New Eagle 35-45-h.p. Car.

rear end of the motor, they being readily accessible—seeing that no fly-wheel is employed—by lifting up the driver's floor board. Ignition is by high tension magneto and the water circulation by gear-driven pump. A feature of the cars is the employment of an epicyclic or planetary type of change-speed gear giving three speeds forward and a reverse. This is a type which is largely used on American cars and one to which increasing attention is being given in this country. The gears are always in mesh, the first two speeds and reverse motion being obtained by the tightening of bands on their respective drums. On the top speed

the whole gear-box is locked together by means of a clutch having metal faces, the drive being then direct, by a cardan shaft and bevel gear, to a live axle. The rear-springs are of the double-elliptic type, and the torque rods are of special design; they not only extend right from the back axle to a point on the rear frame in a line with the motor, but are built up of plate springs. Other points to which attention may be drawn are the mounting of the steering gear on, instead of below, the frame, and of supporting the starting handle entirely on the engine. The car is fitted with a roomy side-entrance body. A 10-12-h.p. car, with four-cylinder engine and epicyclic change-speed gear, is also on view.

#### The Laurin-Klement Cars.

A new voiturette of Austrian construction is seen in the Laurin-Klement exhibited by Mr. E. H. F. ENGLEHART. The engine, which is of 8-9-h.p., comprises two cylinders arranged in the form of a V (Fig. 5). The inlet valves are of the ordinary suction type and the ignition by low tension magneto. The water circulation is on the thermo-siphon system, no pump being employed. The drive passes through a leather-faced cone clutch to a gear-box giving three speeds and reverse, with direct drive on top speed to the cardan shaft and thence by bevel gear to a live axle. The gear-box is so constructed that the shafts may be drawn out from the rear in case of necessity. The standard car is fitted with a two-seated body, but an additional seat at the rear can be provided if desired.

#### Some Other Cars.

The REX MOTOR MANUFACTURING COMPANY exhibit several examples of the Rexette car, which, while having only three wheels, runs on four tyres, the rear one being of the twin type. This is claimed not only to reduce the chances of skidding, but also to distribute the strain on the driving wheel. The engine is of 8-h.p., and

Fig. 5.—View of forward end of chassis of Laurin-Klement Car.

comprises two cylinders in the form of a V. Three speeds forward and a reverse are provided, the final drive being by chain. The car is adapted to carry two persons on the front seat, the driver being at the back. A "Brown" 18-20-h.p. side-entrance car is displayed by Messrs. BROWN BROTHERS, LTD., and Mr. A. PELLANT exhibits a chassis of the latest type of 28-35-h.p. Pilain car, the change-speed gear of which is arranged to give a direct drive on both the third and fourth speeds. A somewhat novel single-seated car known as the "Sabella" is shown by Messrs. A. T. WARNE and Co., of Leytonstone, and it is stated to be designed for the use of doctors, travellers, golfers, and professional men. While, no doubt, much thought has been given to its production, we are afraid that the machine is far too lightly built to prove satisfactory in practice. The engine is a 5-h.p. air-cooled twin-cylinder, fitted with an arrangement by means of which it can be started from the seat. The transmission is by chains, and the single seat is supported on C-springs. The BRITISH DUPLEX MOTOR CO., LTD., exhibit a chassis of a 20-h.p. car fitted with the special two-stroke air-scavenging engine, of which some particulars will be given in our report on the Olympia Show. AUTOMOBILES DE LUXE, LTD., display a range of Darracq cars representative of a number which they keep on hand for hiring-out purposes. AUTOCARS AND ACCESSORIES, LTD., of West Norwood, show a 6-h.p. Starling car provided with a convertible body so that it may be used either as a two-seated pleasure car or as a light delivery van.

Among the exhibits which have become familiar to motorists and which find a place in the Show is the Aralizing installation of the ARA PATENTS CORPORATION, of London, W.C.—a simple system of vulcanizing new rubber into cuts or gashes in the covers or inner tubes of tyres with a minimum of delay on the road. The idea is exceedingly simple and the method of application effective. Whittle's

link-grip belt for motor-cycles, cars, &c., is a combination of leather and steel links, and has already received attention in our columns. Messrs. T. WHITTLE AND SONS, LTD., of Warrington, who are the makers, point out that the method of construction secures that the surface in contact with the pulley is of leather only, and of large area. Mr. F. L. ANDERSON has a display of motor specialities, in which tyre gaiters, non-skid bands, &c., figure largely, the HAGEN ACCUMULATOR WORKS occupying the next stand with their well-made accumulators for all classes of automobiles. Mr. A. C. WRIGHT is represented by his motor-cycle foot rests and a good selection of lamps and carburettors.

The WALTHAM AUTOMOBILE COMPANY exhibit a two-seated run-about, fitted with 4-h.p. air-cooled engine. The car, which is steered by a tiller, is stated to be capable of attaining a speed of twenty-five miles per hour.

#### A Novel Tyre Guard.

A somewhat novel device known as a tyre guard is exhibited by Mr. LOVELESS, of Upwey, Dorset; it consists of two brushes, arranged one in front of each of the steering wheels of the car, the idea being that the brushes will sweep out of the way of the same any puncturing or destroying material, such as sharp stones, rusty nails, &c. The apparatus, which is shown fitted to a Spyker car, is supported from the front axle and cross steering bar in such a way that it follows any movement of the forward road wheels; the brushes themselves are of steel, and can be readily renewed when necessary. The inventor claims that by the use of his arrangement cuts in the outer covers are practically eliminated and a consequent saving in the tyre bill effected. The idea is undoubtedly a simple one, but whether motorists generally will be inclined to convert their cars into road sweepers, even to their own benefit, remains to be seen.

The COUNTY CHEMICAL COMPANY, LTD., have a new steam vulcaniser and a series of repair outfits for tyres, among the latter being G.B. tyre cure, a new renovator for repairing cuts, gashes, &c., in motor tyre covers. Another preparation on the stand is a leather restorer for giving to the upholstery of cars a gloss and texture equal to new.

A large display is made by the PRESTED MINERS' GAS INDICATING ELECTRIC LAMP COMPANY, whose Prested batteries for automobiles have become standard accessories. A new plate has been introduced into the battery by which the risk of swelling is obviated, a new composition of metal now taking the place of the all-lead grid previously employed; new multi-cylinder coils are also exhibited as well as the Prested test lamp. This is made in the shape of a pencil, and is a very compact and handy testing arrangement. Universal charging boards, hydrometers, voltmeters, ammeters, &c., complete a very attractive show of electrical accessories.

In tyres the PALMER TYRE, LTD., show their motor-cycle tyres, the covers of which have been made stronger for the coming season. Messrs. REDDAWAY AND CO., LTD., and the Macintosh Tyre Co., are also represented in this section. The OTTO-BENNETT MOTOR AND ENGINEERING CO. draw renewed attention to their See non-skid puncture-proof bands and non-skids as well as gaiters of an excellent type and examples of repairs to tyres, in which they are developing an excellent connection. The company are making a special feature of retreading Michelin non-skids and plain rubber treads. Among the accessories on view is Payne's hose clip, a non-skid band preservative composition, and selections of Duckham's motor oils, these latter being of high grade. The INDIA RUBBER, GUTTA PERCHA AND TELEGRAPH WORKS CO., LTD., have a show of their "Le Persan" motor tyres, as well as of patches, india rubber solution, and all descriptions of rubber goods. The AVON INDIA RUBBER CO., LTD., also have a display of tyres for motor-cycles and sundries relating to repairs, &c. They are bringing out a new non-skid for motor tyres in which cross grooves are the leading feature. A new detachable rim with an ingenious yet simple fastening is shown by the BURNHAM DETACHABLE MOTOR RIM COMPANY, of Liverpool. The SELF SEALING RUBBER CO., LTD., of the Hermetic Works, Ryland Street, Birmingham, show their non-skidding tyres and their Hermetic specialities in all kinds of motor rubber goods as well as a detachable joint for air tubes, &c. The Exonite steering wheel of DOVER, LTD., noticed in our report of the Olympia Show, is also on view at the Stanley Show, as well as the leather goods of Messrs. J. BROOKS AND CO., LTD., to which full reference was made in last week's M.C.J. The SOUTH BRITISH TRADING CO., LTD., have a selection of accessories, including lamps, sparking plugs, spanners, &c., and the Skinner compound motor tyre pump, by means of which large motor tyres may be pumped up with 100 lbs. pressure with a minimum amount of exertion. Messrs. NICKELLS AND COMPANY take advantage of the occasion to show their nuts and fasteners for accumulators and sparking plugs, valve connectors and other specialities to which reference has lately been made in these columns.

Messrs. SWAN and Co., 212-216 and 228, Pentonville Road, King's Cross, N., have a large selection of motor-car accessories, including lamps, horns, voltmeters, &c., as well as their Cape cart hoods and glass screens, the latter embodying some good points of construction. Other good shows of motor sundries are made by Messrs. BROWN BROS. whose "Duco" specialities are well known; and the East London Rubber Co. Messrs. LAKE and ELLIOT show a complete line of handy tools for repair work and their motor-cycle jacks and stands. THE BIFURCATED

AND TUBULAR RIVET CO., LTD., have several new patterns of bifurcated rivets in all lengths and gauges.

Storage batteries and ignition coils are exhibited by Messrs. H. W. COX, LTD., of Rosebery Avenue, and Laystall Street, E.C. Their "C.M." type of grid should be examined by motorists. The bars of the grid, being on either side, allows the active material to form a complete block held in by the wedges at opposite angles of the cells. The separators are placed in channels on either side of the plates. On the bottom of the two outside plates of the section are placed two feet on each side, and across these is fixed a celluloid bridge, which keeps the section well off the bottom of the cell, while holding it securely and preventing the separators from moving. Well made and carefully thought out, this style of construction should commend itself to motorists.

Messrs. HARVEY, FROST AND CO., LTD., have a complete selection of their well-known vulcanisers, the new features of which have previously been mentioned in these columns.

A newcomer is seen in the UNION RUBBER AND CHEMICAL COMPANY, LTD., of Shaw Street, Ashton New Road, Manchester, which makes a bold show of lubricants, rubber goods, &c., for motorists, the distinctive trade name of "Turco" being applied to all the productions of this firm. The Turco carbide is put up in tins of a convenient size, and so treated when quite new that it is rendered unaffected by atmospheric action, and even after being kept a long time will yield the maximum five cubic feet of gas to the pound. Tyre repair outfits, rubber solutions, a repair band, motor oils, greases, gaiters, and similar goods are included in the range of the Union Rubber and Chemical Company's productions.

Immediately on entering the building the visitor is met by the familiar display of Mr. R. W. COAN, whose capacity for the production of aluminium castings, &c., finds new demonstration at each succeeding Show. Here is a selection of aluminium cases which have been repaired as well as illustrations of new parts made into old cases that have been broken. The patent aluminium steering wheel with hollow rim and spokes is also shown by Mr. R. W. Coan, who thus enables the hot water from the circulating pipe to be run through the wheel and back to the tank by a return pipe, a device that might well be considered by the motor-bus companies now that the winter is with us. Near the stand of the M.C.J. is that whereon the STERN-SONNEBORN OIL COMPANY, LTD., have a selection of their specialities. Further along PRICE'S PATENT CANDLE COMPANY have their complete display. Messrs. TAYLOR AND CO. show their spanners in larger sizes than have hitherto been exhibited. In the prominent position which it occupies at the Cordingley Motor Shows SELVYT finds a place, its variety of uses being fully shown, including lamp covers, metal dusters, and the score of ways in which its merits as a polish cloth are appreciated. Near by is the speciality of the LYXAGON COMPANY—a liquid soap, capable of dissolving grease on the hands, and thus proving of interest to motorists. MUNTZ'S METAL COMPANY, LTD., of French Wall, near Birmingham, is represented by a selection of aluminium castings for automobiles, such as crank cases, gear boxes, and the like, as well as copper tubing for motor-cars. Messrs. GRINDLEY AND CO. have a selection of their Pioneer brand of motor oils and greases, which they are supplying to many of the London motor-bus companies, and for the purposes of several motor mail vans. The "Eclair" pump connection, by means of which an air-tight joint can be made, is shown by Mr. H. HARDING. This consists of an interturned rubber washer, which is pushed over the valve to secure an instantaneous tyre pump connection when necessary.

Messrs. STEINER AND COMPANY have their usual display of lamps, horns and accessories, additional interest being given their exhibit, however, by the presence of the Hella motor headlight, for which the firm are British agents. In this lamp there is a convex nickel-plated reflector, constructed as a door, giving easy access for cleaning the lamp behind the burner. The front glass is some distance from the burner, and hence out of danger from cracking. There is little likelihood of the light blowing back in a high side wind, owing to the excellent construction of the lamp, which has certainly come to this country with a high reputation.

Messrs. C. J. RENTON AND CO., of 139, Long Acre, W.C., are the London agents for M. Louis Auteroche, whose lamps for all classes of motor vehicles are now introduced to the public. A first glance at the special features of the display reveals the good construction of the lamps, the most notable of which is that which secures incandescent lighting by benzoline and oxygen cartridges, and to which we shall make fuller reference on another occasion. The Zanardini lamp is now being handled in this country by Mr. C. F. BERTELLI, 1, Albemarle Street, Piccadilly, W. These are of striking appearance and great illuminating power, and should become as familiar on high-grade cars in this country as they are where their merits are better known. Another lamp which is attracting attention is the "Frankonia," introduced by Messrs. W. TWEEN AND CO., the inverted helmet shape presenting a novel appearance.

The BOWEN AND ODERY MANUFACTURING COMPANY show their "Sentinel" accumulators, the celluloid cases of which are well calculated to withstand hard wear.

One of the simplest detachable rims that has yet been introduced is shown by the BERESFORD MOTOR RIM COMPANY, of Newcastle, Staffordshire. This consists of a ring of metal, which can be easily slipped on the rim and the inflation of the tyre keeps it securely in position, locking the two ends that overlap.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### EXPERIMENTS WITH COMPRESSED ACETYLENE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with great interest the references to the use of compressed or liquefied acetylene for lighting purposes in connection with motor-cars, especially as I have, for the last two or three months, been experimenting with the dissolved acetylene supplied by the Acetylene Illuminating Company, and I must say that under no circumstances would I go back to the old method of having an acetylene gas generator, with all the attendant troubles and annoyances in connection with recharging and cleaning. The gas is supplied in cylinders, and each cylinder contains sufficient for from fifteen to twenty hours.

impossible to use it, and was subject to the Explosives Act (38 Vict. c. 17). It was subsequently discovered, however, that acetylene, when compressed into a certain porous substance containing acetone, does not possess explosive properties, and certain rules were laid down for the handling of acetylene gas treated in this manner, and when so treated the cylinders containing it were exempted by special order of Secretary of State. I have made most careful inquiries, and am convinced that there is no danger whatever in the use of these cylinders, which are made under these special regulations, and I therefore have no hesitation in continuing their use myself and recommending them to those of my friends who are interested. Some very interesting experiments were carried out at the Royal Naval College two or three years ago, and it was clearly demonstrated that no element of danger existed.—Yours truly,

CHAS. JARROTT.

### LIVE AXLES AND DIRECT DRIVE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your last week's issue I notice a letter from Mr. S. F. Edge in which he states that "a live axle and direct drive as introduced by Mr. Napier in 1902." As there have been so many claims as regards

Touring in France.—A Pretty View near St. Flour, in the Auvergne.

use. The great advantage I have noticed in connection with using these cylinders is that one can turn the gas on and off at will in the same way as an ordinary gas tap. There are two points of importance in considering the advisability of using this gas in connection with the motor car—the first its cost, and the second the danger from explosion. On the first point I may state that the cost appears on the face of it to be somewhat expensive, but I find that in actual use it is, in fact, cheaper than using ordinary carbide. It is seldom that one has to use acetylene for a longer period than, say, two or three hours at a stretch, and very often the lamps have to be lit for only half an hour's use. On these occasions the whole charge of carbide is practically spoilt, and it therefore follows that if the lamps are lit for a number of short periods the waste in connection with the carbide is very considerable. By the use of the dissolved acetylene gas, however, the gas can be turned on and off at will, just as and when it is required, with all the attendant trouble in connection with emptying out water and carbide before the car is put away for the night entirely obviated. The actual extra difference is not very considerable, and, to my mind, it is one of the best things I have tried in connection with motoring for some time.

Dealing with the question as to the danger in using compressed acetylene, I would like to mention that originally it was practically

introduced by this gentleman, I think it would be interesting to your readers to know that the Belstar Motors, Ltd., made their first live axle in 1900 and exhibited same at the February Show in the Agricultural Hall in 1901, and have also continued to use the live axle right up to the present day. It is also interesting to note that they built their first six-cylinder car in November, 1904, and have turned out as many as seven cars of this type in one week. Synchronous ignition was introduced by them in 1902, and has been used ever since on all types of cars made by them. I feel sure you agree with me that Mr. Elge's firm is not the only one in the British industry to introduce new features.—Yours truly,

R. CROSSLEY.

### THE QUESTION OF SPEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to the letter of Mr. A. L. Hickman in your issue of November 17th, I want to point out that it is at any rate not always necessary, as he states, to be examined in order to receive the "permis de circulation" for touring in France. I had to pay twenty francs only for that document, and ate my breakfast while the pre-

liminaries were gone through. In fact, in my case the whole thing was a farce. The idea is right enough, but like many other good intentions, the practice is not ideal. His remarks re the nature of the English driving licence are most appropriate and to the point.—Yours truly,  
A. J. MCKINNEY.

### THE PROPOSED AERIAL ASSOCIATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have had a number of letters from persons who are interested in the solution of the aerial problem, and who are desirous of joining the proposed Aerial Association, but I have noticed that the majority of these are from London or the neighbourhood. I have thought that this circumstance may be due to the fact that I have omitted to mention any address to which such letters might be sent. I might add that, although three years is mentioned as the time during which I have felt confident of being able to design a successful aerial machine, this period was mentioned simply because it was only during this time that I felt sure that an internal combustion engine sufficiently light for the purpose could have been obtained. The model upon which I first demonstrated the principle referred to in my letter was an actual fact made in 1898. I shall be glad to hear from any persons interested in this question at Thanet House, Temple Bar, London, W.C.—Yours truly

J. D. ROOTS.

### GLASS SHIELDS AND THE RAIN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR—As there are now so many motor-cars with canopies, or glass shields, I thought the following tip might interest a few of your readers. Anyone who has driven a car in the rain, especially at night, will readily admit how difficult it is to see far ahead, owing to the raindrops sticking

A Thirsty Car.

all over the glass. To get over this difficulty I wipe off the wet, and then rub the glass all over with a piece of cloth soaked in glycerine. This will appear dull at first, but as soon as it is rained upon it will become as clear as though it had been dried. I have driven from London to Sheffield in pouring rain with only two applications. If glycerine cannot be obtained, paraffin is a good substitute, but when this has been rained on it is necessary to rub it over with the hand to make the drops of rain go even all over, and it does not last long. I am never without the handkerchief and bottle of glycerine. Other motoring friends may have a remedy, but, judging by what I have seen, this is not generally known.—Yours truly,

J. H. HALL.

### DISCOMFORT AT OLYMPIA.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“Lest we forget” before the next show the annoyance which all have suffered from the dust this year at Olympia, would it not be a wise plan for the Society of Motor Manufacturers and Traders to make some decision at once for the betterment of this disagreeable condition for next year?

If the aisles were covered with cocoanut matting and lightly sprinkled with water, as in the Paris show, there would be very little flying dust. Not only is the dust bad for exhibits, and unpleasant to exhibitors—especially ladies—but it creates a most unwholesome atmosphere for those engaged constantly at the show for ten days.

The condition of nervous exhaustion known to all concerned in the show, due to the confinement and long hours, is greatly augmented by the bad ventilation and dust-laden air.

The object of the show is to exhibit and sell cars, and motor-cars are not bought in a moment like cigars, and no one will remain long in

a fetid atmosphere who does not have to, and a lack of attention to the seemingly small details of ventilation and cleanliness will, in many cases, drive buyers away, and defeat the purpose for which the show is established.—Yours truly,

A. H. ADAMS.

### IMPRESSIONS AT THE SHOW.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Walking round the Show last week one was surprised to find such a large number of well-made and beautifully-finished vehicles. A slight reduction was found in the prices of the high power cars, but this was not the case with the smaller machines, which latter are, however, now of much better construction than before. I looked in vain for a ready good small car, of British make, costing less than £200. The general design, from an outside point of view, has not altered very much since last year, although in detail there is very considerable improvement to be seen and studied.

One was surprised to find so many firms now building cars fitted with six-cylinder engines, but there is yet room for many improvements in the design of these vehicles. There are two points which I would recommend motorists in buying cars to give special attention to. First, the method for locking the selector bars for the change-speed gears, a locking gear being necessary to ensure perfect safety. Second, see that the brakes are thoroughly compensated. I mention these two points in particular, as their necessity is very soon discovered in practice, sometimes with bad results.—Yours truly,

W. W.

### WIRE SPOKED WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are quite in accord with the claims which Mr. J. V. Pugh is setting forth in favour of carrying a spare wire-spoked wheel with tyre fitted in place of the usual detachable rim systems, and it may be interesting to note that the new 9-h.p. Riley car which is now being introduced has wire spoked wheels which are interchangeable with each other. We are, moreover, recommending that a spare wheel with tyre fitted be carried to replace either of the four wheels in case of puncture, &c. The principle of attachment appears somewhat similar to that adopted by Mr. Pugh, the outside hub cap forming the locking device for the hub, which slides over a sleeve, the drive being taken by suitable projections, which in the case of the back wheel form part of the brake drum fixing. The weight of a standard wheel with 700 mm. by 90 mm. non-skid tyre fitted is 31 lbs., so that no exception can be taken as regards weight, while the unscrewing of a single cap nut is certainly quicker and easier than the detaching of a rim from the wheel.—Yours truly,

VICTOR RILEY.

### MOTOR PROGRESS ON THE CONTINENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been in France and Switzerland lately, and I am not much impressed with the progress of the motor movement abroad. All the hotels in Lausanne and Territet and Montreux appear to use horse-buses, and even in Paris there are not many motor-buses, though of course the small number of horse-buses also in the French capital must be taken into account in comparing Paris with London. In Boulogne, Dijon and Geneva I saw no motor-cabs at all; indeed, I only saw a few in Paris during my tour. I have a view of the Hotel de Ville, in Dijon, showing ten horse cabs in the foreground, a curious commentary on the progress of automobilism in France.—Yours truly,

CECIL JACKSON.

### IGNITION DIFFICULTIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be much obliged if, through the medium of your journal, you could tell me what is the matter with a 12-16 h.p. Tony Huber car that I am driving.

It runs all right for a day or two, then all of a sudden begins to miss-fire and keeps on doing so for two or three days, then just as suddenly it changes again and goes properly. A new wipe roller has just been fitted to the contact maker, but it does not seem to make any difference. I have examined all plugs, and find that they spark all right when the engine is stationary. I should be pleased if you could suggest any reason for this.—Yours truly,

C. HILL.

[This trouble may be caused by the spring which holds the roller on the contact being weak, or in all probability is due to a bad earth return. A good plan is to get a contact-breaker cover fitted with a contact piece coming into action on the end of the spindle which carries the roller arm. In many cases the trouble may also be overcome by thoroughly washing out the bearing carrying the spindle, and lubricate with thin oil. A roller contact may also be run in thin oil to advantage.]

OUR inquiry for the address of the publisher of Mr. E. Wright's Summary of the Motor Car Act has produced a reply from the Academy of Motoring, who issue this admirable summary of the Act in a very concise form.

## CLUBS AND ASSOCIATIONS.

### PETERBOROUGH AND COUNTIES.

THE members of the above club recently held a re-union to commemorate the tenth anniversary of the Motor Car Act, meeting at the Great Northern Hotel, Peterborough, and having a run to Norman Cross. Those taking part included Messrs. C. E. Pointon, F. W. Southwell, F. S. Southwell, J. Pointon, J. H. Booth, R. S. Parris, J. Wilkins, A. Stallebrass, T. Woodman, W. Walshaw, F. T. Heighton, S. B. Cox and J. Matthews, hon. sec.

### DERBY AND DISTRICT.

THE headquarters of this club have been transferred to the Royal Hotel, Derby, which is the official local house of the A.C.G.B.I. It is hoped that in the course of a few weeks the club will have successfully carried through negotiations which are pending for the provision of a permanent private garage.

### SOCIETY OF MOTOR-OMNIBUS ENGINEERS.

BEFORE the members of the Society of Motor-Omnibus Engineers, who met at the Hotel Cecil, London, on Monday, Dr. H. S. Hele-Shaw examined the questions involved in the theory and practice of power transmission in public service vehicles. The conditions which had to be fulfilled were, that acceleration from rest must be rapid and smooth,

## TOURING IN SPAIN.

THE following extract from "The Car of Destiny," the new novel by Mr. and Mrs. C. N. Williamson, published by Messrs. Methuen and Co., will be of interest to those contemplating a tour in Spain:—

To avoid the town it seemed that we must steer into chaos, void and formless; but there were only a few hundred yards of desert. Beyond we found ourselves in a good road, which led to the white village we had been told to expect, and there, as we were already primed with information, we wasted no time in asking questions. Instead, we plunged into open country, with a vista of olive trees in the grey-green distance. From fair, the road dwindled to doubtful; then to a certainty of badness. It narrowed; softened to a sandbank; hardened into a wilderness of rocks and stones scattered between deep ruts dug by the wheels of ox-carts. Apparently no other vehicles than these had ever weathered the terrors of this passage; yet we persevered, for here were the promised olive trees, so near, indeed, that we lurched against them as we rocked from side to side. We had been warned whatever happened not to be discouraged, and we cheered each other bravely, while our heads bumped against the roof. "It will surely be all right soon."

Meanwhile, however, it was a nightmare; the sort of thing which a delirious chauffeur might dream and rave of in a fever; and instead of improving the way grew worse.

"Let's turn back," said Dick. "Another hundred yards like this, and even if we don't smash the differential or the chassis, Ropes will get side-slip of the brain. Half an hour of such driving must be equal to a week in purgatory for a chauffeur."

From "The Car of Destiny.

The Way into Gay Madrid.

and that gradients, no matter of what inclination or length, must be taken with as little as possible variation from the maximum permissible speed. In crowded cities the former might be of far greater importance, whereas for vehicles running in the country, especially in hilly districts, the opposite might be the case. Unless the variable speed gearing was thoroughly effective from the point of view of easy manipulation, small transmission losses, durability, and silence, it put the petrol or paraffin driven 'bus at a great disadvantage to its steam rival. As to which type was best, the question was not likely to be decided except by the survival of the fittest. Dealing with the different gears at present in use, the speaker approved those in which the changes were effected by pedals rather than levers, for it was most important that a driver should be saved from the necessity of taking his hand from the steering wheel to change gear—a man who could do it while his vehicle was skidding was a perfect genius. If the internal combustion motor was to continue so largely to hold the field against electricity and steam, there might be changes in the matter of transmission gear greater than at the present moment they could venture to forecast with any certainty.

THERE are now nine ambassadors on the list of honorary members of the A.C.G.B.I.

THE Southend and District Motor Club and the Lincolnshire Motor Cycle Club are seeking affiliation to the Auto Cycle Club.

SATURDAY, July 15th, has been provisionally fixed for the open hill-climbing competition to be held by the Midland A.C. at Shelsley Walsh, Worcestershire, next season.

We did turn back, and, feeling years older, arrived once more at the point from which we had started. We would have given something to see the guides, but they had prudently taken themselves off like full-fed vultures. This time we made no inquiries, but trusted to our intuition and our maps, which, without once contradicting each other, led us into a decent road that seemed like a path to Paradise after all we had endured.

Making up for lost time and revelling in joy of motion, we put on our best speed, which for a few moments brought the roadside telegraph posts as close together as fir trees in a Norwegian forest. But suddenly the motor slowed, and stopped with a tired sigh within sight of a village white as newly polished silver.

"Petrol gone," said Ropes. "It oughtn't to be, but it is. Extra strain in that short cut of the Duke's used it up."

He got out and untied a "bidon" from the reserve store fastened upon the footboard. But the tin was light in his hand as a feather. He gave a low whistle, and a shadow darkened his face—a shadow which was not made by the brim of his motor cap as he bent his head to examine the bidon.

"There's a leak here, sir," he said to me—for, though Dick was supposed to be his master, in moments of stress he clung to old habits. "Looks as if the tin had been pricked with some sharp instrument. H'm! Shouldn't wonder if it had been. It would be of a piece with all the rest."

"You mean at Toledo?"

"Yes, sir. Everything was right then. I bought enough petrol in

Madrid to last to Cordova, pretty well all we could carry, and ordered more to meet us there, grande vitesse, in case I couldn't get it, as you said we were sure to go that way."

"Well, let's look at your other bidons. We shall be in a fix if we're held up here."

"Two more empty," announced Ropes. "And three bidons don't suddenly take to leaking of themselves. I suppose if I'd had my wits about me I'd have looked at Toledo before starting; but who's to think of everything?"

### NEW COMPANIES REGISTERED.

**BRITISH AND COLONIAL DAIMLER-MERCEDES SYNDICATE**—£10,000. Motor-car and omnibus proprietors and dealers, carriers, &c. 1, Broad Street Place, E.C.

**HERON MOTOR COMPANY**—£2,500. To acquire the business carried on by Mr. J. J. Horne at 89 and 91, John Bright Street, Birmingham. First directors, Messrs. J. J. Horne and J. S. Arter. 89 and 91, John Bright Street, Birmingham.

**LIVERPOOL AND DISTRICT MOTOR COMPANY**—£15,000. First directors: Messrs. A. L. R. Rathbone, W. K. Poulson, and R. H. Baker. 8, Cook Street, Liverpool.

**ARGYLLS, MANCHESTER**—£10,000. To adopt an agreement with Argyll Motors, Limited, for the appointment of this company as selling agents in and around Manchester. First directors: Messrs. A. Govan (chairman), R. H. Carlisle, and T. J. van Hooydonk. 188, Deansgate, Manchester.

**FRENCH'S GARAGE AND MOTOR WORKS**—£6,000. To acquire the business carried on by W. F. French and Fanny R. Arey at 314, High Road, Balham, as the South Western Motor Company, and to adopt agreements (1) with the said vendors and (2) between R. K. Inman and T. H. Wright. First directors: Messrs. W. F. French, R. K. Inman (chairman), and T. H. Wright. 29A, Charing Cross Road, S.W.

### PUBLIC MOTOR SERVICES.

THE chauffeurs of the Automobile Cab Company recently decided not to take their cabs out in consequence of the statements made by Mr. Perry, the managing director, who attributed the comparative failure of the motor-cab in London to incivility and lazy independence on the part of the drivers. Subsequently a deputation from the drivers waited on the directors and the manager of the company, and at the close of the interview it was announced that all the difficulties had been amicably arranged. The men consequently resumed work on the usual terms.

IN a printed reply to Mr. Timothy Davies, who asked the Home Secretary whether special regulations would be issued to ensure the safety of the travelling public, in view of the motor-omnibus collision with Waterloo Bridge parapet on October 30, Mr. Gladstone (the Home Secretary) replies that the accident was due to skidding, and that he has already communicated with the Commissioner of Police about the occurrence and on the general question of such accidents on bridges.

### SCOTTISH AUTOMOBILE CLUB APPEAL.

AN appeal, which was taken at the instigation of the Scottish Automobile Club from the Police Court at Ayr to the High Court of Justiciary in order to determine the competency of the jurisdiction of magistrates or other summary courts other than the Sheriff Courts in Scotland under the Motor Car Act, 1903, was fully debated in the High Court of Justiciary last week, before the Lord Justice Clerk, Lord Stormonth Darling, and Lord Low. The Lord Justice Clerk intimated that the judges considered the case one of great importance, and that they have accordingly determined to send it to a bench of seven judges.

### MOTOR-CARS ON THE FOOTPATH.

AT the Blackpool Police Court the case of J. C. Derham and Henry Culpin has been up again for the infliction of a penalty. Mr. Culpin was summoned for driving a motor-car over the footpath on Central Beach, but the case was dismissed, and upon the Corporation appealing to the High Court the case was sent back for the imposition of the penalty. The Bench imposed a penalty of 5s. and costs.

### ROAD REPORTS.

**NORTHAMPTONSHIRE**—The county automobile club has been in communication with the county surveyor with regard to the way in which some of the roads are repaired. Satisfactory assurances on the matter have been given by the department concerned—another instance of the benefit of organisation.

**HAMPSHIRE**—A motorist who recently went to Southampton via Bishop's Waltham complains that the road was being repaired in many places, and that it seemed the usual practice to allow the unrolled stones to remain across the whole width of the highway instead of dealing with half the width at a time. This latter method is in vogue in many districts.

## CASES UNDER THE MOTOR-CAR ACT.

### FAILING TO COMPLY WITH REGULATION AS TO NOISE.

AT the Shrewsbury Police Court, William Heatley, chauffeur, in the employ of Miss Louisa Rose Morris, Oxon Hall, near Shrewsbury, was summoned for having, on November 5, failed to comply with the regulations of Article 5 of the Motor Cars (Use and Construction) Order, 1904—viz., did not make prompt and effective use of means to prevent noise when in charge of a motor-car. The case for the prosecution was that the defendant left a motor-car standing in the square for seven minutes, with the engine going and the car vibrating. The defence was that the car was not left for more than two or three minutes, and that although the defendant had not strictly complied with the order the noise made by the motor was no nuisance, and the case was one which should not have been brought into court. The Bench decided that the charge was proved, but as this was the first case of the kind brought before them it was dismissed on payment of costs, £1 3s.

### A QUESTION OF IDENTIFICATION.

Mr. S. A. de la Rue, of Cadogan Square, S.W., was summoned in the Westminster Police Court for driving a motor-car in a manner dangerous to the public in the Fulham Road on November 3rd. Mr. A. Moresby White, instructed by Messrs. Kenyon and Co., defended. A police-constable stated that a collision occurred in the evening of November 3rd between a motor-car, a cab, and some furniture vans, and that the present prosecution was taken on information received. G. Matthews, the driver of the hansom cab, and other witnesses gave evidence as to the collision; they admitted on cross-examination that the road was very greasy and in a dangerous condition. The motor-car skidded across the road and the driver appeared to be doing all he could to control and direct the car. At the close of the case for the prosecution Mr. Moresby White submitted that there was no case for him to answer, as no evidence had been given that his client was actually the driver of the car at the time. The magistrate, Mr. Curtis Bennett, said all he knew was that there was a furniture van, a cab, and a motor-car with a motor-omnibus in front, but it had not been proved that the defendant was there at the time. The summons must be dismissed.

### MOTOR-CAR ACCIDENTS.

AN inquiry has been conducted in Newcastle Royal Infirmary into the death of Alexander Jamieson, who was knocked down by a motor-car and died the following day. George Waggott, an eye-witness, stated that the driver of the car sounded his horn several times, and the car was not travelling at more than four miles an hour. If the deceased had regarded the signal he had ample time to get into a place of safety. The jury returned a verdict of "Accidental death," and attached no blame to the chauffeur.

WHILE Captain Frank Kayser was driving his motor-car through Tansley on Monday it struck a boy who had just jumped off a cart. Captain Kayser motored post haste to Matlock to bring a doctor, but the boy died shortly afterwards.

A KIRKBY collier is at the Nottingham hospital suffering from severe injuries, the result of foolhardy conduct in stepping in the way of a motor-car. He was standing outside a public-house, and noticing a motor coming along, he said to a companion, "Watch me stop this." He then stepped into the road in the way of the oncoming vehicle. The driver pulled up as quickly as possible, but a projecting portion of the canopy struck the man on the left side of his face.

### A MOTORIST ACQUITTED.

MR. JUSTICE PHILLIMORE, at Monmouth Assizes, concluded the hearing of the charge of manslaughter against George Harris Handasyde, a London motor expert. Motorists agreed with the accused that the only hope of avoiding the accident was to put on top speed and swerve. The car was travelling at the rate of 17 miles an hour. Had the chauffeur slowed down and put on the brakes the car would certainly have passed over the cyclist. It was impossible for the motorist to swerve and put on the brakes simultaneously. Counsel for the Crown contended that the prisoner had been guilty of reckless and furious driving, and that if he had exercised reasonable care the fatal collision would not have occurred. The jury found the prisoner not guilty and he was acquitted.

### POLICE TRAP.

THERE is a police trap between Cobham and Ripley which has been in active operation of late.

A NOVELTY on the stand of Mr. R. W. Coan at the Stanley Show is a new telephone receiver in aluminium. By means of universal joints it can be adjusted to any height, and saves the necessity of holding the receiver by the hand for any length of time. The idea is a good one, and Mr. Coan's method of application fulfils all the requirements of such a handy device.

# THE Motor-Car Journal.

LONDON, SATURDAY, DECEMBER 8, 1906.

[No. 405.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

A CAPITAL all-round sportsman, able to wield the willow, guide a motor-car, or—perhaps most uncertain sport of all—edit a paper, Mr. C. B. Fry occupies a distinguished position in this country. We trust the hotel proprietors who really wish to become prosperous after the manner of those of the olden time will study the warning he has just given them as to the need of making hotels more like homes. It will often pay them to treat motorists going their way as desirable persons, instead of regarding them as mere birds of passage never to be seen again—and, therefore, only to be plucked once. That is, perhaps, an unfair way of looking at things, and our own experience with "mine host" has been of a more pleasurable kind. But there may be some truth in the plaint that hotel proprietors have not universally recognised the conditions imposed by the new locomotion, the provision of garages being one of the first steps to be taken in such a direction. Here, however, improvement is being made, and we are always glad to hear from those proprietors who provide such necessary accommodation.

### The Fuel Question.

WITH commendable promptitude the Motor Union's special committee on the fuel question has got to work, and is now collecting evidence bearing on the conditions which determine the price of petrol and the possibilities of alternatives being provided for the motor-car. So far two gentlemen have given useful information to the committee, Mr. J. H. Knight's experiments being of particular interest at the present time. He has come to the conclusion that paraffin is only slightly more difficult to manipulate than petrol, and "with modern methods it should be possible to employ, even on private cars for touring and town work, paraffin in every day use," but for heavy commercial motors and public service vehicles Mr. Knight is of the opinion that some form of producer gas will be the solution of the fuel for internal combustion engines. The cheapness of this producer gas—the cost being one tenth of a penny per b.h.p. as compared to the 1d. to 1½d. of petrol—is the point that has brought this expert to this conclusion.

### Producer Gas.

ON this point of producer gas Mr. Knight says, the producer and cleaner, placed close to the dashboard, would be so made that they could be removed by unscrewing eight bolts and the gas and water couplings, a clean set being put in, say, once a week. The cleaner could be kept cool by grills, which would reduce the quantity of cooling water. The hopper would be made to hold two or three charges, so that the producer could be recharged more than once on each journey. Two men would be required at each journey's end to charge or change hoppers, which could easily be done at eight or ten minutes' interval by means of a light crane and tackle. If petrol was used for starting and on stiff inclines a good deal of gear changing

would be avoided; the quantity of petrol used would be very small. Mr. Knight does not think users of pleasure cars will use producer gas for very many years, but, if the omnibuses now running gave up using petrol, it would possibly check the rise in price for some time to come, and here, he believes, the problem is a practical one.

### Paraffin.

THE Fuels Committee has also elicited the views of Mr. J. F. Bennett, who, with confidence, declares that he has arrived at a method of using paraffin which gives results similar to those obtained when petrol is employed. The basis of the system is the use of carburetted air in contradistinction to the use of vaporised oil. All his experiments have proved that vaporised oil is uncertain, troublesome, and unsatisfactory, except under certain favourable and exceptional conditions. The carburetted air does not readily condense in Mr. Bennett's device. His carburettor brings a stream of cold air in contact with a current of finely divided particles of paraffin, the latter being previously warmed to approximately 212 deg. Both stream and current are caused by the suction of the engine, and thus a rich carburetted air is produced. This mixture impinges upon a hollow metal globe, through the interior of which the exhaust gases pass. The mixture is thus heated, and then used in the ordinary way in the working cylinder. The finely divided stream of paraffin is previously heated separately by the exhaust. He prefers to start with petrol, but can start by heating with a lamp, and has recently taken out a provisional patent for an invention which will secure a start with paraffin cold. We understand that the Committee of the Motor Union intend to thoroughly investigate this device upon a car.

### A Warning.

OUR attention has been called to a firm that offer drivers assured positions on receipt of a fee. This suggestion is sometimes made to the advertisers in the *M.C.J.*, who may be warned not to part with their money until they are in the situation. Of course, we do not now refer to the recognised agencies that seek to bring the chauffeur and the employer together; but promises of certain definite situations which can be given on payment without further inquiries are too alluring and tempting for many in search of employment. Those who advertise in our columns and then receive circulars making such offers are advised to acquaint us of the receipt of the same at the earliest possible moment.

### Ten Years of Motor-Cars.

OF the making of books dealing with the automobile movement there is no end. Mr. Worby Beaumont and other technical experts have written their learned volumes; publishers have sent forth their annual records of progress, and in the Badminton Library many writers have contributed chapters on various aspects of Motorism from their own particular standpoints. And now comes an account of Mr. C. Jarrott's "Ten Years with Motor-cars," written by himself and illustrated with pictures and photographs of the "old brave

days" when to race on a motor-car was a defiance of danger and a most perilous undertaking. None knows that better than the author of this book, just published by Mr. E. Grant Richards. On the sporting side the work is complete and cheerful; but a strange inaccuracy has crept in on page 8, where the first real show of motor-cars is said to have been held in connection with the Stanley Show in November, 1896—thus ignoring the Imperial Institute display of the previous May and the exhibition organised by Messrs. Cordingley and Co. in August of the same year, which has always been regarded as a pioneer of such shows. In the first chapters we have many reminders of the time when there was "real fun," when the clothes of motorists resembled "a mixture of a South African explorer and a bush-ranger," and when no one knew exactly what was going to happen. Mr. Jarrott's most promising early exploits were in connection with motor cycling, the reminiscences of which are still of interest, while the view of the trio, Messrs. C. Jarrott, C. G. Wridgway (now in America), and S. F. Edge, starting for the motor-cycle championship in 1899—only seven years ago—suggests how quickly advance has been made since then. Then follows descriptions of the famous Continental and Gordon Bennett races—valuable because they contain the impression of a participant in most cases—as well as sketches of the motorists whose names have acquired international fame. To that section of a very interesting volume we propose to make reference on another occasion.

A Reminiscence of Summer.

#### Proposed Speed Limit for Newmarket.

A LOCAL Government Board inquiry has been held at Newmarket into the application of the West Suffolk County Council for a speed limit of ten miles an hour upon two miles of the main road through Newmarket. The applicants were represented by the Clerk to the County Council, and Mr. Rees Jeffreys appeared on behalf of the Motor Union, the A.C.G.B.I., the Cambridgeshire and Isle of Ely A.C., and the Bury and West Suffolk A.C. At the conclusion of the case for the applicants, Mr. Jeffreys, speaking on behalf of the bodies he represented, intimated that in view of the unique character of the traffic upon the main roads through Newmarket, and the support that the horse trainers had given to the application, the bodies he represented were prepared to withdraw their opposition to the application. He suggested, however, certain alternative methods for dealing with the traffic of which the applicants complained, and which the Union and the A.C.G.B.I. were prepared to carry out at their own expense. If these were found by the local authority, at the end of three months, not to be successful, the speed limit might then be tried. The Inspector, Mr. F. J. Willis, stated that he would report to the Board and the decision would be made known in due course.

#### A Reasonable Attitude.

DUE notice should be taken of the attitude of the representative of the motoring interests in this matter. It should certainly dispel the notion that seems to linger in some quarters to the effect that motorists are unreasonable persons, unwilling to recognise the interests of other users of the road, and prone to think and act selfishly without regard to anyone else. There are undoubtedly exceptional circumstances in the town of Newmarket which do not occur anywhere else, and the probability is that some sort of restriction may be imposed on those who drive cars in that district.

#### A Dangerous Corner.

Two years ago a serious accident, in which a motor-car turned turtle in avoiding a cyclist, took place where the Westwood road turns into the main London and Aldershot road near Bagshot. A few weeks ago another mishap occurred at the same spot, but with a fatal result. Now the coroner suggests that the authorities should take steps to protect the public at that point in future—and all who travel on the road will agree with him. But it should not have required a coroner to warn the Berkshire County Council of the dangerous character of that corner. There are many similarly treacherous curves on our main roads, where collisions between vehicles approaching in opposite directions can scarcely be avoided; surely these can be brought to the notice of the authorities before they are associated with fatalities. Until the authorities recognise their public duties, however, we must look to the Automobile Association and the new committee of the Motor Union to provide warning notices, if they cannot trim hedges and remove other roadside obstructions.

#### In the New Forest.

WE have been asked by Lord Montagu to emphasise the warning which has been officially issued by the Verderer of the New Forest with regard to drivers of motor-cars along the delightful highways of that part of Hampshire. Unfortunately the pleasure of motoring has not always been unattended with danger to the animals that roam about its paths, and the Verderer is probably right in the suggestion that the majority of motorists are ignorant of the peculiar condition of things existing in the New Forest. Having regard to the tolerant attitude of the authorities in the past, there is little doubt that motorists from a distance will respect the feelings of those who reside in the vicinity and take especial care not to do anything which may have the effect of raising local prejudice against automobiles.

#### In Epping Forest.

OF all the lovely spots surrounding the metropolis, Epping Forest is the most easily accessible, commencing as it does just beyond the seventh milestone from the City. West-enders should drive through Regent's Park and Camden Road to the Nag's Head at Holloway, and thence along Seven Sisters Road to Tottenham, twist round across the river Lea, pass the waterworks, and follow the tram lines to their termination up Chingford Old Church Hill, and past Chingford Station to the Forest Hotel, just beyond which, on the left, is the Connaught Water. Continuing straight ahead, the road runs into the main road that leads straight to the Wake Arms, shortly beyond which is situate—on the right, a few yards from the road—the Roman Camp called Ambresbury Banks—crude but easily discernible banks raised by the Roman invaders of Britain some 2,000 years ago. Epping Town is a mile beyond. Returning to the Wake Arms, the left-hand road should be taken to Loughton. Straight Londonwards the road rises over Buckhurst Hill, and then through Woodford and Whipp's Cross along the Lea Bridge Road to Clapton. The motorist who has sufficient

time may see more of the Forest by turning very sharp to the right at the fork between Buckhurst Hill and Woodford, and driving again towards Epping, turning sharp to the left, down past Connaught Water and the Forest Hotel, then sharp to the right along a road which will take him to Sewardstone and Waltham Abbey, again to the right and along another road to Theydon Bois and Abridge, and so homeward through Chigwell, by Dickens's "Maypole" (the King's Head) and Woodford Bridge, and thence past Snarebrook and the Lea Bridge road to Clapton, or at Snarebrook straight ahead through Leytonstone to Aldgate and the City.

#### All the year round.

ALTHOUGH the weather has been characteristically fickle of late, cold dry winds alternating with damp atmospheres, motorists have been out and about in fairly good numbers. At one time people looked upon the car as only a fair weather vehicle; but nowadays they regard it as suitable for all the year round, and what with detachable bodies, removable canopies, and other adjuncts of the modern car, the automobile has become recognised as a vehicle for all seasons. The tailors, too, who have followed the automobile movement have recognised their

mobile industry will join in the hope that the new Act will do something to mitigate an acknowledged, though not easily traceable, evil.

#### Automobile Demonstrations.

IN view of prospective legislation next year, the General Purposes Committee of the Motor Union is now considering the suggestion of Sir J. H. A. Macdonald that demonstrations or gatherings of motorists should be held in every important centre throughout the kingdom, at which meetings should be held and resolutions adopted emphasising the views of motorists on the subject. It is proposed that these gatherings should take place on the anniversary of the 1,000 mile run, and that everything should be done to make them imposing to the Legislature and educational to the public. Certainly the automobile lends itself to such proceedings, and, but for the dust nuisance, we should have advocated Motor Car pilgrimages from town to town, calling on police inspectors on the way, and generally making it an occasion for informing the police of the peaceful tendencies of those who uphold the new movement. Such, however, is impossible, and probably the best service that can be rendered to those who will have

A Fanciful Solution of the increasing Traffic Problem.

[Motor, New York.

importance in this development, and the selection of winter clothing of really useful and yet inconspicuous design is very different to what we were accustomed to in the early days.

#### Secret Commissions.

NOT without interest to the automobile industry is the fact that on the first day of next month the Secret Commissions Act comes into operation. There have been many rumours of dealings between various people associated with Motorism that have savoured of attempts to secure money without rendering adequate value, and the purchase of goods has sometimes been said to have been influenced by commissions the existence of which was unknown to the principals in the transactions. These wily dealings are always difficult to locate; we do not anticipate that their discovery will be made easier by the new Act. But the fact that secret commissions are regarded as offences against the law, and that those who thus defy the intention of the legislature will be liable to the infliction of pains and penalties by order of the Court may serve as a deterrent to the novitiate in such methods. Mr. Marshall Hall, K.C., recently gave a good round denunciation of secret commissions in the motor trade, and all interested in the fair fame of the auto-

charge of the motorists' case in the Houses of Parliament is for all to drive with caution and care, remembering that an individual indiscretion is often used to damage the whole body of motorists.

MR. E. SCHENK, at the annual meeting of the Electromobile Company, Ltd., has expressed a hope that the new garage which the company is building upon a half-acre site in Mayfair will be opened in time for the next London season.

MESSRS. HUNTLEY WALKER AND Co. inform us that they have recently acquired the sole agency for Minerva four-cylinder cars for Yorkshire and Lancashire; they have also been appointed agents for London and district. In addition the agency for the new Weigel cars has been acquired for London and Lancashire.

FROM Messrs. T. De La Rue and Co., Ltd., comes a selection of diaries and tablet calendars for 1907, which are varied in their form and size, ranging from the daintiest little purse book to volumes of a larger and more utilitarian character. The firm make a speciality of thin diaries in limp leather cases, known as the "Flexible" series; while index diaries are another excellent section of their publications. Tablet calendars are also a good line of these diaries, which may be commended as a most artistic and splendidly produced series of annual reminders.

# The Paris Motor-Car Exhibition.

Le Grand Palais, Paris. The Locale of the Exhibition.

THE ninth annual Salon d'Automobiles, which is to be officially inaugurated in Paris to-day (Friday), by M. Doumerge, the French Minister of Commerce and Industry, will remain open till Christmas Eve, during which time it will be visited by motorists and motor traders from all parts of the world. The huge Grand Palais, at the corner of the Champs Elysées and the Pont Alexandre III., and the "Serres" or Horticultural Palais, on the banks of the Seine, have proved too small for the annual display, the result being that the motor-buses and heavy commercial vehicles, the motor-boats and machinery in motion have been relegated to the Esplanade in front of the Invalides, which has been covered in as an annexe, the temporary buildings which have been erected covering an area of 12,000 square metres. The Grand Palais itself has been in the hands of a huge army of workmen for about a fortnight, and the result of their labours is seen in the magnificent display now housed under its roof. The leading motor-car builders have, as usual, vied with each other as to who shall have the best decorated stand, for which a prize is offered, the consequence being that the general aspect is, if anything, more brilliant than ever. A few firms are utilising their old stands, but the majority are quite new and comprise some excellent specimens of wrought iron work. Brilliant as was the illumination and decoration both inside and outside the Grand Palais last year, it is being surpassed on the present occasion. Flagstaffs have been planted all along the Champs Elysées from the Place de la Concorde, the Avenue d'Antin, and the Avenue Nicolas II., across the Alexandre Bridge, and round the Esplanade des Invalides, and they will be connected by strings

of electric lamps. This week we are forced to content ourselves with a description of the exhibits of two or three well-known firms; but, in accordance with our usual practice, a full account of the novelties and 1907 models of the leading concerns, based on personal observation, will be given in the succeeding issues of the *M.C.J.*

## The Lion-Peugeot Light Cars.

Les Fils de Peugeot Freres, of Beaulieu (Doubs), are now turning out two interesting models of cars of respectively 6-h.p. and 8-h.p. for the motorist of moderate means. Although the general arrangement is the same, the smaller vehicle is fitted with a two-seated body, while the larger one has accommodation for four persons. As will be seen from Fig. 1, the machines are replicas in miniature of more powerful cars with side-chain transmission, the chassis comprising a pressed steel frame, push pedals, wheel control, &c. The 6-h.p. single-cylinder engine has a bore of 100 mm. by 100 mm. stroke, the dimensions of the 8-h.p. being 110 mm. by 110 mm. The valves are arranged side by side and are mechanically operated by a cam shaft driven by skew gearing off the crank shaft. In addition to the water-circulating pump, one is also provided in connection with the lubrication of the engine and gear-box, both being gear driven. The radiator is of the framed ribbed-tube type. Ignition is either by magneto or accumulators, as required. The transmission is by an inverted leather-faced cone clutch to a gear-box giving three forward speeds and a reverse, and thence by bevel gear to a differential shaft, which is, in turn, connected with the rear road wheels by side chains. Three pedals are provided—one operates

Fig. 1.—The Lion-Peugeot Voiturette.

a brake on the cross-shaft; the second withdraws the clutch and at the same time automatically reduces the speed of the motor, while the third pedal is connected up to the throttle valve. The vehicles can, it is claimed, attain a speed of twenty-eight miles per hour; they are economical in fuel consumption, the makers stating them to be capable of covering a distance of thirty four miles to the gallon of petrol.

diameter, and the framed ribbed-tube radiator is provided with a fan. The clutch is of the leather-faced cone variety, and the gear-box gives three forward speeds and a reverse, with direct drive on top speed through a cardan shaft to the live axle. The latter has only the driving strain to withstand, dog clutches on the ends transmitting the power to the hubs of the rear road wheels, the latter running on ball bearings on the outer casing.

Fig. 2.—Chassis of the Automoto 18-24-h.p. Car.

#### The Automoto Cars.

A make of car which is not very well known in England is the "Automoto," built by La Société de Constructions Mécaniques de la Loire, of St. Etienne. Three sizes are being made—7-9-h.p. single-cylinder and 12-16-h.p. and 18-24-h.p. four-cylinders. We give an illustration of the chassis of the latter in Fig. 2, from which it will be seen that it follows the standard lines of chain-driven vehicles. The cylinders—100 mm. bore by 150 mm. stroke—are cast in pairs, with the valves arranged on opposite sides. The clutch is of the expanding metal-to-metal type, a universally-jointed shaft connecting it with the gear-box, the four speeds of which are controlled by a lever working in a "gate." Ball bearings are used to all parts

#### The Ader Cars.

La Société des Automobiles Ader has entirely abandoned the V-type of engine for its motor-cars, which are all now provided with four-cylinder vertical motors built to the designs of M. Ph. Richemond. Two sizes are being made, 16-20-h.p. and 25-30-h.p., and transmission is either by side-chains or by a cardan shaft, according to the desire of purchasers. A similar choice is also allowed in connection with the suspension, the makers supplying either a transverse spring at the rear, or, failing this, replacing the usual dumb irons by halves of semi-elliptic springs. The motor has the cylinders all cast separately, a bearing being provided between each throw of the crank shaft. The base chamber is not furnished with arms in the usual way, but it is

Fig. 3.—Plan of Chassis of Ader 16-20-h.p. Car.

except the engine. The 12-16-h.p. vehicle is on similar lines, except that the final transmission is by a cardan shaft and bevel gear to a live axle. The new 7-9-h.p. two-seated car appears a solidly constructed vehicle; the engine is a single-cylinder, 100 mm. bore by 110 mm. stroke, the normal speed being 1,200 revs. per minute. The water circulation is on the thermo-syphon system, no pump being employed. The pipes are of large

provided with a lip on each side, and extending the whole length of the motor, by means of which the latter is supported on the pressed steel frame. The lip also forms a platform on which the pump, magneto, carburettor, &c., are mounted. Both foot and hand control of the throttle is available, while in addition the clutch pedal is also so coupled up that as the clutch is withdrawn the speed of the engine is automatically cut

down. Ignition is by magneto, with provision for installing accumulators and coil as a reserve. Universally-jointed shafts connect the clutch with the gear-box, and the latter with the differential shaft, this being placed well to the rear in order to give a short chain-drive. The Ader cars appear to be of thoroughly sound construction and of reasonable price, and deserve to be better known in England than they are at present.

Fig. 4.—The Pilain Four-Cylinder Engine.

#### The Pilain Cars.

The Société des Automobiles Pilain, of Lyon, exhibit two models of respectively 18-24-h.p. and 28-35-h.p. The engine (Fig. 4) comprises four cylinders cast in pairs with the valves arranged on opposite sides; the dimensions of the 18-24-h.p. are 100 mm. bore by 130 mm. stroke, and of the 28-35-h.p., 124 mm. by 140 mm. The ignition is by Simms-Bosch low-tension magneto. The engine, the crankshaft of which is *desaxé*,—that is to say, is slightly out of line with the centre of the cylin-

Fig. 5.—The Pilain Change Speed Gear with direct drive on third and fourth speeds by separate Bevel Gearing.

der—is provided with a special form of automatic carburettor, and is so arranged that when the vehicle is running down hill the throttle can be entirely closed and an air-valve opened, which enables the motor to act as a brake. The four-speed gear is of a type which appears to be gaining in popularity, a direct drive being available on both the third and fourth speeds. This is obtained, as will be seen from Fig. 5, by means of two concentric

bevel pinions, either of which can be made, by means of clutches, to transmit the power direct to the corresponding bevel wheel on the differential shaft. The latter is of special design, and comprises two short cardan shafts carrying small spur wheels on their outer ends, which mesh with driving rings attached to the rear road wheels, which latter are carried on a fixed axle.

#### The Foullaron Car.

M. Foullaron continues to turn out cars, ranging from 6-h.p. single-cylinder to 15-18-h.p. four-cylinders, fitted with his special variable speed gear, which since its introduction has, however, been subjected to slight modification. The engine is set in the fore part of a pressed steel frame in the usual way, and drives through a clutch a pulley connected to a second pulley by a combination chain belt of peculiar construction. Each pulley is formed of two lamellated jointless cones, the arms of which are so intertwined that the inner end of each cone penetrates the interior of the other. The bottom of the pulley is represented by the circumference limiting the intersection of the two cones opposed to each other. One of these cones is movable, and can, by sliding along the shaft, penetrate more or less into the stationary lamellated cone, and thus modify the diameter of the bed on which the belt rests. A lever, connected to a non-reversible driving mechanism, enables one of the cones of each of the pulleys to slide along simultaneously, but in the opposite direction. This movement causes a variation in the diameter of the pulleys without modifying the tension of the chain, and enables the entire range of speeds, from a gear equal to five miles per hour up to one giving twenty-eight miles to be obtained. A spring, the tension of which may be

Fig. 6.—Plan of Foullaron Car.

safely regulated whilst the car is running, is inserted in the driving gear, and tends to augment at the same time the diameter of the two pulleys. It automatically takes up all play that might be set up at high speeds by centrifugal force, and does away with slipping of the belt. The latter consists of a series of links or blocks of chrome dressed leather mounted upon a chain of case-hardened steel. The shaft on which the second pulley is mounted, as will be seen from Fig. 6, is connected with the rear axle by a cardan shaft in the usual way. The reverse is obtained by means of a second bevel wheel on the differential shaft; the bevel pinion on the rear end of the cardan shaft is mounted on an eccentric sleeve, so that, by means of a special lever, it can be brought into mesh with either the forward or reverse driving crown wheel. The speed may be varied without disengaging the gear, which enables practical advantage to be taken of all the speeds comprised between the limits available. Thus when ascending a gradient it is not necessary to "race" the engine; on the contrary, the latter should be kept running at its normal speed, the gear being varied slightly to suit. We hear that a 32-seated motor-bus, fitted with the Foullaron transmission, is in course of construction.

(To be continued.)

IN the new detachable rim of the Continental Tyre Company eight clamps secure it to the felloe, and it is detached complete on easing the nuts. Three large keys are placed at equal distances around the rim, and these engaging with slots in the felloe transmit the drive. Altogether the device has the merit of simplicity and should prove efficient.

## CONTINENTAL NOTES.

### The Late M. Jeantaud.

The death of M. Ch. Jeantaud took place in Paris on Friday last week. The deceased, who was sixty-two years of age, was one of the pioneers of the motor-car in France and took a leading part in the development of electrical carriages, his first vehicle being produced as long ago as 1881. He devoted much attention, too, to the question of motor-cabs, and in 1898 built a four-wheel vehicle with hansom body, the driver's seat being perched high up at the rear. The machine was exhibited at the 1898 show at the Agricultural Hall, London, and was driven by its designer in the memorable run to Hounslow at the conclusion of the Exhibition, the novel vehicle attracting considerable attention.

### The 1907 Herkomer Trophy Touring Contest.

Some changes have been made in the route of the 1907 Herkomer Touring Trophy contest, which is to be held in June

copies of forms which any motoring visitor may be called upon to supply or fill up before being permitted to use his car in France.

### Motor-cars for Military Purposes.

The Austrian military authorities have lately been carrying out some trials of a new motor-car designed for the transport of ammunition and wounded soldiers. The vehicle, which was built by Messrs. Laurin and Klement, is of 12-h.p., and is fitted with double-cylinder engine.

### Public Services in Germany.

It is proposed to establish a motor-bus service between Zittau, Olbersdorf and Oybin. A similar connection between Glashütte and Tegernsee is also in contemplation.

### The French Reliability Trials of 1907 Models and of Heavy Vehicles for Military Purposes.

The reliability trial of 1907 models and of heavy vehicles for military purposes organised by the A.C.F. is still in hand.

The French Trial of Heavy Vehicles for Military Purposes.—The Competitors leaving Marseilles.

next. As finally decided upon, the course to be followed is as follows:—First day, Dresden to Eisenach; second day, Eisenach to Mannheim; third day, Mannheim to Lindau; fourth day, Lindau to Munich, with speed trials in the Forstenrieder Park; fifth day, rest in Munich; sixth day, Munich to Augsburg, with hill climbing competition up the Kesselberg; seventh day, Augsburg to Frankfurt or Homburg. The whole distance to be covered is about 1,200 miles.

### The Automobile Regulations of France.

France is the happy hunting ground of motor tourists of all nationalities, particularly British and American, to whom the book recently written by Mr. H. Cleveland Cox, and published by Brentano's, Paris, should prove of considerable use. Printed in English, it gives in a handy form the regulations relating to automobiles obtaining in France. Twenty pages are devoted to a brief summary of the similar rules in other European countries, while the concluding part of the work is devoted to

In the first-named competition twenty-four out of the thirty-seven cars which started are still in the running, sixteen of these having, so far, not a single penalisation to their credit. The vehicles, after being on exhibition for two days in Monaco, left that town on Sunday for Marseilles, Lyons being the destination on Monday, and Dijon on Tuesday.

### Miscellaneous Items.

Motor-cabs fitted with taximeters are about to be introduced in Marseilles and Bordeaux.—A motor-boat exhibition is to be held in Kiel from June 14th to July 1st next year.—An automobile exhibition is to be held in the Palace of Fine Arts, Madrid, in May next.—The Automobile Club of Milan has decided to organise a reliability trial of touring cars during the course of the Milan Motor Show in May next.—A school of automobile engineering is being established in connection with the Ecole des Arts et Metiers in Madrid.

## IN LIGHTER VEIN.

WITH the exception of babies and bi-metallism—two subjects strictly avoided at all well-ordained dinner tables—there is no more difficult a topic of conversation to the lay person, desirous of maintaining a reputation for not less than average intelligence, than that of the motor-car. Hitherto the weather, the Royal Academy, the newest novel, and the latest musical comedy have made up the field over which the caber of our social small talk has been flung; but now that the motor has descended—Juggernaut-wise—in our midst and attained to a very epidemical height of popularity, the minds of the uninitiated are threatened with an overpowering strain, the consequences of which (unless some help is speedily forthcoming) may prove disastrous in the extreme. As no guide to the art of polite conversation on motor-car etiquette has put forth a helping page, I have been requested by the editor of the "Indian Motor News" to throw myself into the literary breach and offer a few words of advice to the hapless novice suddenly called upon to assume an intelligent interest in the foregoing subject.

Experience has pointed out to me that the most usual pitfall which assails one's unwary footpath is that of being requested by a male or female friend—or their chauffeur—to come and admire the new car. In the case of the driver's invitation, there is no danger; you can always reply that you would like nothing better, but that you must reserve the pleasure until some more favourable opportunity. With a friend, of course, this excuse will not do, so it is best to seize the brute by

The End of the Day's Run.

the throttle, so to speak, and, composing your countenance into a strict, judicial expression, follow gravely in the owner's footsteps to the garage, cowshed, greenhouse, or wherever else the article of torment is kept. Having arrived, and if your friend is of the male sex, gaze fixedly at the car for a few minutes, and then ask to see the engine; under no circumstances whatever must you admire the body, that is quite of secondary importance. When the bonnet is opened ask in an off-hand manner if there is anything extraordinary about the ignition or the carburettor—there is always something special about one or other of these devices, and the question will have the double effect of calling forth a flood of explanations—which will save your making any further remarks and possibly committing yourself—and giving a high opinion of your technical knowledge. When he is thoroughly winded, ask if he would mind "starting her up." He will probably essay to do so and fail, in which case you must put on a pitying smile and suggest that possibly the "mixture is wrong." If he succeeds, you can gently murmur in an admiring tone—"Capital! Congratulate you on your acquisition, old man," and turn the conversation as quickly as possible into safe and more congenial channels.

In the eventuality of the owner being a lady, your chances of being flooded are considerably less. So long as you confine your remarks strictly to the colour of the paint, the symmetrical rotundity of the tyres, the comfort of the upholstery and the finish of the brasswork, she will be absolutely satisfied. Should the car be fitted with an electric device upon the dashboard for signalling instructions to the chauffeur, get inside the

car and press the various buttons which work the lights and letters in the indicator, until the accumulator is quite run down, after which you will probably both feel so thoroughly exhausted that your proposal of an adjournment to basket chairs in the conservatory will be gladly welcomed, and you will live henceforward in the lady's heart as one of the most charming and well-informed persons possible. These few words of advice have also the advantage that they can be used—with variations—at dinner, afternoon tea, and, in fact, upon all occasions when motor talk is vaunted.

Another casualty which is apt to befall the tyro is that of being present on the occasion of the breakdown of an acquaintance's motor, in which he has basely offered to drive you to some country house situated a few score miles from any decent town. Naturally, in this case, the main object of you both is to get the accident put to rights as quickly as possible, especially if the afternoon is well advanced and the weather looks unsettled. If your motoring acquaintance is a novice, strike an admiring pose upon the side of the road farthest removed from the oil-can and spanners, and remark in an audible *sotto voce* that you congratulate yourself upon being out with an old and experienced hand—a jocular observation to the effect that "now we shan't be long" is also a tremendous help. The above-mentioned posture and a few encouraging words in the latter strain induce a fund of resourcefulness in your companion and make him take a cheerful view of the situation; they also, incidentally, spur him on to redoubled exertions in wrestling with the mechanism, and preclude the possibility of his requesting your assistance, which would render you unnecessarily hot and dirty.

If, contrariwise, your acquaintance is an expert, or considers himself as such, then your position must be altered a little. It is safe to say that, usually, the greater his knowledge—or prided knowledge—the longer will be your sojourn in the wilderness. A novice—by sheer luck—may lay his hand on the seat of trouble in a few minutes: an expert, never. Your plan, therefore, is to so sicken him of the car that in sheer desperation he will suggest walking to the nearest village, sending therefrom a man with some rope and a horse to tow the beast home, and obtain a more sober conveyance in which to proceed to your destination. To this end, therefore, you must keep on offering well meant suggestions. For instance, while he is engaged "tickling the carburettor," you should say, "How about the commutator?" and when he turns his attention to that piece of machinery, remark "And the sparking plugs—have you examined them?" By the time you have prompted the dismantlement of a good quarter of the internals of the brute, and the greater portion of the bolts and nuts adorn the interior of the guard beneath the engine, he will more than joyfully second your suggestion to leave the thing to a certified mechanic.

N.B.—This plan may end in a severance of your friendship, but in any case there is a doubt whether the acquaintance of such an individual is worth further cultivation. R. E. G.

THE WOLSELEY TOOL AND MOTOR COMPANY, LTD., have sent us a copy of their 1907 catalogue, in which full particulars are given of the latest types of Siddeley cars. Included in the list is an interesting article entitled "Touching the Choice of a Car," while the text is embellished by a series of well-executed pen and ink sketches of the different forms of vehicles.

MESSRS. S. F. EDGE, LTD., have recently received orders for two six-cylinder Napier cars of 40-h.p. for South African buyers that will be somewhat unique. One of the purchasers is Mr. F. M. Cullinan, well known in Johannesburg, who had a 30 h.p. six-cylinder car specially built for South Africa, the use of which has been so satisfactory that he decided to have one of the latest type. Mr. H. S. Stark, a leading mining engineer of Johannesburg, has also ordered a similar car. The vehicles will both be built with 40 in. wheels, to give extra road clearance to escape obstacles and also to raise the body to permit of the crossing of fairly deep spruits. Everything will be arranged so that the cars can go through a couple of feet of water without difficulty, and petrol capacity sufficient to run 800 miles without replenishment will be provided on each vehicle.

THE General Motor Cab Company, Ltd., intend to employ the Stepney Spare Wheel on the motor-cabs which they are putting on the London streets.

WE learn that the Victoria Carriage Works, of Long Acre, W.C., have secured the sole concession for the Léon Bollée cars for Great Britain and Ireland.

THE Sirdar Rubber Company, Ltd., have received another order for Royal Sirdar Buffer Tyres for the Prince of Wales.

WHAT is probably a record order from India has, we are informed by Mr. S. F. Edge, been placed with his firm. The Nizam of Hyderabad has purchased and received delivery of six Napier cars, five of them being six-cylinder vehicles. One is a

limousine for the Nizam's own use, two carriages are for the ladies of the Zenana, two open touring cars, one of which we illustrate, are intended for his suite, while the sixth is an 18-h.p. car to be used as a pilot. A noteworthy feature of the machines is the use of wire wheels in place of those of the artillery type.

AT 139, Long Acre, W.C., Messrs. C. J. Renton and Co. have a depot for the repair of the Auteroche lamps, for which they are agents.

THE balance-sheet of Messrs. A. Darracq and Co., Ltd., shows a profit for the past year of £222,281. There has been a distribution of 25 per cent. dividend for the year on ordinary shares.

MESSRS. PANHARD AND LEVASSOR'S extensive new repair works at Acton Vale, Uxbridge Road, W., are now in a very forward condition, and will be opened on the first day of the new year.

OF the cars shown at Olympia about one-third were fitted with "Continental" tyres, and the new red rubber Continental steel armoured non-skids were also much in evidence on some of the leading makes of cars.

THOSE motorists and motor agents who contemplate a short visit to the Paris *Salon* may be interested to learn that the London, Brighton and South Coast Railway are issuing Friday to Tuesday tickets to Paris *via* Newhaven and Dieppe at cheap rates.

WE understand that Messrs. Brooke Motors (London), Ltd., the sole concessionaires for the Brooke six-cylinder car, booked a considerable number of orders during the recent Exhibition. Agents who are anxious to take up the sale of the new vehicle should write to the company without delay.

MR. LESLIE BUCKNALL, who left Wandsworth Gasworks on Tuesday afternoon of last week in his balloon "Vivienne IV.," descended at Vevey, on the shore of Lake Geneva, at daybreak on the following day, after a remarkable voyage. The balloon travelled a distance of 420 miles in sixteen hours, reaching Vevey in four hours less than the journey from Charing Cross to the same place occupies by the quickest boat and railway route. The "Vivienne IV." reached Rye, in Sussex, at five o'clock on the Tuesday, and, crossing the Channel to La Touquet, passed Amiens, Rheims, and Chaumont during the night—following a route which must have almost coincided with that of the railway.

THE Pytchley Autocar Company, of Northampton, have a garage with accommodation for fifty cars and excellent facilities for the repair of vehicles.

THE Valor Company, Ltd., of Rocky Lane, Aston Cross, Birmingham, are the makers of the "New Era" fire extinguisher referred to in a recent Show report.

THE offer of the Adams Manufacturing Company, Ltd., regarding the £2,000 aeroplane prize is not restricted to the use of the "Antoinette" engine, but may be won by any combination of aeroplane and motor, the sole condition being that the flight be made within the next two years with an entirely British-built flying machine.

MESSRS. CHARLES LETTS AND CO., who have attained distinction as diarists during a long period, have their usual selection of annual books, in which the insurance policy plays an attractive part. Apart from that excellent feature, however, the Diaries have merits on their own account, the patent self-opening tablet being another exclusive adjunct. By this contrivance the diary can always be opened at the place in use. In addition to the pocket diaries, Messrs. Charles Letts and Co. have a long series of diaries for the office and the business establishment, automatic date blocks, motor-car log books, and other diaries of various kinds. Their admirable office reminders are another speciality of an old-established firm of diary publishers, who keep well abreast of modern requirements.

THE accompanying illustration depicts a Crossley 20-25-h.p. chainless car fitted with a new and novel type of body designed by Mr. C. Jarrott for his own personal use, and built by Messrs. Salmon and Sons. The vehicle is a single limousine, the seats being located in the position usually occupied by the ordinary driver's seat, the occupant, therefore, being in a comfortable position to drive himself. Accommodation is provided for three persons, and, in the event of it being desirable to carry a mechanic, a fold-up seat is fitted into the back. The top of the car is arranged for the carrying of luggage, and an ingenious celluloid shield which slides into a pocket on the roof is provided

for use in rainy weather. All the windows at the sides and at the back, with the exception of the two front curved panels, let down, and the large window in front is divided so that the driver can have an uninterrupted view without the other passengers being exposed. The height of the celluloid screen is so arranged as to be just above the line of vision of the driver. The change-speed lever and the side brake are arranged inside the carriage body.

MR. C. H. RYDER's garage at Heathfield Station, Sussex, is being enlarged.

THE St. Paul's Studio of Design, 2, 3 and 4, Cheapside, E.C., are specialising in connection with motor photography.

MESSRS. H. E. HALL AND COMPANY have been appointed agents for London and district for the new Singer light cars.

A MOTOR carnival will probably be held at Worthing next Easter, Councillor G. H. Warne taking a leading part in the organisation.

CONSENT has been given by the Middlesex Education Committee to the establishment of motor construction classes at Acton and Chiswick.

NEARLY all the important banks of San Francisco now employ motor-cars in their business in order to maintain rapid communication between the head offices and the branches.

A NEW garage and workshop is being erected in Bridge Street, Guildford, for Messrs. S. P. Rice and Co., Ltd., of which private limited company Mr. G. P. Rice, the official repairer to the West Surrey A.C., is managing director.

WE recently made mention of the "Accurate" speedometer placed upon the market by Messrs. George W. Houk, Ltd., of 7, Snow Hill, E.C., who are devoting considerable attention to this accessory department of motor-car work. One form of the appliance is illustrated herewith, although that fitted with the new patent flexible ball shafting attracted most notice at the recent motor-car show. It is gear-driven, and, in addition to being a speed and a mileage recorder, has an indicating hand

that stops at the highest point of speed attained during the journey. It can be reset to zero at will, but, as the face can only be removed by being unlocked, the same device also gives a check on the driver of the car—a useful point to owners of garages and those who let cars on hire. It will continue to record the mileage whether the car is running backwards or forwards, and the mechanism is so simple that Messrs. G. W. Houk, Ltd., are giving a long guarantee to clients.

THE new class-rooms of the Argyll Motor School, where sound courses of motor instruction for both owners and chauffeurs may be obtained, is situated at the new garage in Percy Street, the fine front of which may be seen from the Tottenham Court Road, W.C. This is open day and night.

"DUCO" motor accessories are the subject of a neat booklet issued by Messrs. Brown Bros., Ltd., and should be useful to motorists of all degrees, the range of articles illustrated and priced including everything, from accumulators to sponges and cleaning cloths, as well as clocks, tool kits, tyres, gaiters, jacks, and a few score other accessories.

AT the Stanley Show, last week, the Ivry Car and Motor Works, of Paris, which have lately established a depot at 15, Victoria Street, London, S.W., exhibited a novel form of tri-car, the front seat being provided with a specially-designed cone-shaped bonnet to cut the wind and to protect the passenger from wind, dust, &c. For the carriage of goods a simple light carrier box can be quickly fitted under the bonnet, converting the machine into a useful delivery vehicle. The engine is of 6-h.p., and is of the vertical water-cooled single-cylinder type; the transmission is by chain.

A PROPOSAL to start a service of motor-buses in Calcutta is reported to be at present under consideration.

THE Dublin Motor Show, which opens on the 5th prox., will be opened by Lord Grenfell, G.C.B., G.C.M.C.

TWELVE entries have been received for the 1907 Tourist Trophy race, which will take place in the early spring.

MOTOR-CAR races will probably be included in the programme of the Olympic games to be held in this country in 1908.

TOY motor-boats, motor-cars and airships have a place of honour in Gamage's Christmas Bazaar, which is "the sight" of Holborn, E.C.

THE motor ambulance van used by the Army Service Corps is fitted with twin 5 in. Royal Sirdar-Buffer tyres on the back wheels and single 5 in. Royal Sirdar-Buffer tyres on the front wheels.

MR. G. HILL, who is well known at Brighton in connection with the Old Ship Garage, has taken the premises at 17, Gloucester Place, Brighton, as showrooms and works, and will keep a large stock of tyres, petrol and accessories.

THE resolution to go into voluntary liquidation was carried at the meeting of the Manchester District Motor Omnibus Company, Limited, on Tuesday. The chairman announced that an expression of opinion representing nearly 60,000 shares out of 75,000 had been received in favour of such a course.

THE Acme Rubber and Tyre Company, of 343, St. Vincent Street, Glasgow, are doing excellent repairs to motor-car tyres, their clientele extending to every part of the country. Thanks to the organisation of their works and their thorough system of repair they are able to undertake prompt despatch as well as efficient work.

MR. EDWIN SMEE, of 403, Oxford Street, W., has brought out a new motor and travelling coat, the great feature of which is that it gives extra warmth without additional weight. The principle upon which it is designed can be applied to either ladies' or gentlemen's wear, and, being wind and water proof, it should become quickly popular at this season of the year.

MR. A. RANDEL, Colpetty, Colombo, has established, near the residence of the Governor of Ceylon, a workshop for the repair of motor-vehicles, cycles, &c. In view of the development of automobilism on the island, he hopes to find local appreciation of his enterprise. He is undertaking all classes of work for cars and tyres, the equipment in the latter repair department including the H.F. vulcanizers.

FROM Messrs. Monte-Callow and Co., of Ipswich, comes a pamphlet of the "H. P." electric dynamometer for testing the horse-power of petrol motors. The plant, which is made by M. Hillairet Huguet, of Paris, and which has been adopted by a number of leading motor-car manufacturers in France and Italy, is an absorption apparatus, and differs from the Prony brake in that the friction is replaced by an electro-magnetic reaction.

THERE will be three motor-cab companies in operation in London within the next few days. The General Motor Cab Company has effected a working arrangement with the United Motor Cab Company, and these will place the Renault and the Unic cabs respectively on the streets. A motor-cab garage has been established on a two and a-quarter acre site at the corner of Brixton Road and the Camberwell New Road—opposite Kennington Church, London, S.E.

THE Blotting Pad Diaries of Messrs. Hudson and Kearns are established institutions in our office, long experience having testified to their capacity to stand a year's hard wear and work. These are made in various sizes and with different conveniences for notes; but all fitted with blotting paper of a uniformly good quality—a very necessary feature in such a work intended to last the twelve months. Special attention may be drawn to 8A, which includes a diary, engagement pad, blotting pad and memoranda block—all before the business man as he writes his letter. The Bankers' edition is another excellent member of the series containing a particularly neat date remembrancer, and a good wide area of blotting paper. Only good things can be said of these blotting pads, the merits of which have carried them into many motor-car works, as well as business offices.

# The Olympia Motor-Car Show.

(Concluded from page 879.)

## The Deasy Car.

Probably one of the most novel cars in the Show was the Deasy, which made its debut at the stand of THE DEASY MOTOR-CAR MANUFACTURING COMPANY, LTD. Designed by Mr. E. W. Lewis, who is well known in motor engineering circles, it bristles with novel features, as a perusal of the following brief description will indicate. To begin with the frame of the car, this is of wood and steel construction, the makers stating this to be stronger than pressed steel and less costly to replace in case of accident. The suspension differs from that usually adopted in that it is by three springs, the customary forward longitudinal pair being replaced by a transverse and inverted semi-elliptical spring. The ends of the latter are pivoted to jaws forming part of the axle pivot brackets. The 24-h.p. engine exhibits many original features, for not only are all four cylinders cast in one piece, but the same casting constitutes the main body of the crank chamber, a plan which enables unusually large inspection covers to be fitted, so that the pistons and connecting rods can when necessary be withdrawn through them. Another advantage obtained is that it is possible to fit a light aluminium base chamber which has merely to serve the purpose of an oil-retaining bath, removable from beneath without disturbing the bearings. The four cylinders are 105 mm. bore by 130 mm. stroke. As will be seen from Fig. 75 the cylinder casting is of a rectangular box shape, having not only the entire distributing gear but the valve tappets and stems enclosed, but made ac-

Fig. 75.—The Deasy Engine with Inspection Doors and bottom half of Base Chamber removed.

cessible by large detachable flange plates on both sides. The inlet and exhaust valves are interchangeable, and are all worked off a single shaft. An unusual method of driving the cam shafts, there being two, one operating the valves and the other the magneto and the water-circulating pump, is seen in a short shaft lying across the front end of the engine; it is driven by spiral gear off the crank shaft and drives the two side shafts through similar gearing. The engine embodies Mr. Lewis's cam mechanism, by which not only are the valves operated, but a half-compression device and an air-compressing arrangement obtained, the latter converting the engine into an independent and powerful brake. The method of sliding the cam shaft consists of an adjustable crank arm controlled by a pedal operating a forked striker which engages in a hollow collar forming part of the shaft. The cams are so arranged that as the shaft is moved laterally the lift of the inlet and exhaust valves is gradually reduced until eventually the inlets are entirely closed and the exhausts made to open at the end of the upward stroke of the piston; this is the reverse of the usual procedure and enables the air which is drawn in to be compressed by the rising pistons, so causing the engine to act as a powerful brake. The ignition is by either low or high tension magneto as desired, provision being also made for installing coil and accumulators as a reserve. The

mixture is furnished with a special design of automatic carburettor in which the supply of petrol through the spraying nozzle can be regulated. Passing now to the transmission, the clutch is of the metal-to-metal plate type running in oil; the shaft connecting it with the gear-box is provided with a joint to allow for any want of alignment between the two parts. A stop is provided in connection with the clutch to facilitate changing speed. The gear-box (Fig. 76) is adapted

Fig. 76.—The Deasy Change Speed Gear.

to give four speeds forward and a reverse, with a direct drive on top. The control is by a single lever working in a "gate," which has a direct forward or backward movement, a positive stop for each speed being thus provided. The striking mechanism is entirely in the gear-box, the necessary motion being effected by a toothed quadrant and pinion. The quadrant is arranged horizontally at the bottom of the gear-box, while the pinion is keyed to a rotating cam sleeve, which causes the dogs to slide to and fro as the cam is rotated. The shafts can be removed from the gear-box, and new bearings and gear wheels fitted without detaching the gear-box from the frame. The final drive is by a cardan shaft and bevel gear to a live axle. The cardan shaft, which runs in an aluminium casing, is provided with a universal ball bearing joint at the front while at the rear end it is fixed solid to the driving bevel pinion. Provision is made for supplying lubricant to the differential casing and axle ends by an oil-box provided with a lid, immediately at the rear of the axle casing. Three adjustable pedals are provided, one operating the half-compression and engine brake, the centre one the clutch, and the third the foot brake, which consists of contracting bands on large diameter drums on the rear wheels. The hand

Fig. 77.—The Back Axle of the Deasy Car.

brake, the lever of which is fitted with an Autoloc, no rack being consequently required, actuates internally expanding bands within the same drums. Ball-bearings are employed throughout, the crank and cam shafts of the engine being each fitted with three. The steering column is adjustable so that it may be fixed at an angle to suit the driver. The chassis can, of course, be fitted with any type of body, the exhibit comprising a side-entrance double phaeton.

**The Albion Cars.**

The well-known Albion cars were exhibited by the LACRE MOTOR-CAR COMPANY, LTD. Principal interest was centred in the chassis of the latest 24-h.p. model, in which a number of special features have been incorporated. The engine, which comprises four separate cylinders,  $4\frac{1}{2}$  in. bore by  $4\frac{1}{2}$  in. stroke, has the valves arranged on opposite sides. The arms of the flywheel are arranged to act as a fan to draw a current of air through the framed ribbed-tube radiator. The carburettor is of the automatic variety and the ignition is by a special type of low-

Fig. 78.—The Albion spring drive between the engine and clutch. In the illustration are also shown the parts of the special air pump employed to maintain the pressure in the petrol tank.

tension magneto, in which the magnets, armature and coils are fixed, there being, furthermore, no sliding contacts, commutator or brushes. A reserve ignition by coil and accumulators with synchronised high-tension distributor is also provided for starting purposes. A feature of the Albion cars is the governor, which simultaneously acts on the throttle mixture and ignition, and is itself controlled by a lever on the steering wheel. A new device is seen in a small lever by means of which the gas supply can be entirely shut off, and a port opened instead, giving full air to the carburettor, an excellent scavenging effect being obtained in the cylinders when running downhill. As will be seen from Fig. 79, the mechanical lubricator is supported from the first cylinder and is located under the bonnet between the engine and the radiator; it not only supplies oil to all parts of the motor but to the clutch and the side chains, the feed being proportionate to the speed of the engine. A lever on the dashboard is so connected with it that an initial supply of lubricant may be fed before the engine is started up. The petrol is pressure-fed

Fig. 79.—The Albion 24-h.p. engine, showing the mechanical lubricator near the radiator.

to the carburettor, the necessary pressure being obtained by a small pump driven off the half-time shaft by means of a cam. Fig. 78 gives a view of the special spring drive on the compound shaft which connects the engine with the clutch. The shaft is in two parts, one connected with the engine being the driver, and the other, which runs inside it, being driven. The rear end of the driving shaft or sleeve is provided with one member of a jaw clutch. The other part

of the latter is formed upon a sleeve, keyed to the driven shaft. The two portions of the clutch are always in engagement, but are so arranged as to allow a small definite relative rotation of the two parts. Round the shafts is placed a helical spring connected at the forward end with the driving shaft, and at the rear with the sleeve on the driven shaft. Thus when the spring is subjected to torque its diameter is reduced and its ends engage the closely-fitting parts of the sleeves after the manner of a coil clutch, and thus take up a proportion of the driving effort. The drive is so arranged that should, for any reason, the spring fail, the jaw clutches in the shaft will automatically engage, allowing the car still to be run. As will be gathered from the description of the spring drive, the clutch, which is of the multiple disc type, is not formed in the fly-wheel, but is contained in an extension of the change-speed gear-box. The latter is adapted to give four speeds and a reverse with direct drive on top, the control being by a lever working in a gate. The final drive is by side chains, which are, we are glad to note, completely protected by a steel casing, which effectively prevents the access of mud and dust, and which also acts as a radius rod. Altogether, the new 24-h.p. Albion is a well-thought-out piece of work, and the vehicle should take an equally high position as regards reliability as has the older 16-h.p. model, which, by the way, shows little change from this year's model.

**The Standard Cars.**

The Standard Motor Company, Ltd., Coventry, which has for some time been devoting attention to six-cylinder cars, exhibited two very fine chassis, one being of 30-h.p. and the other of 50-h.p. Dealing with the 30-h.p. model, the six cylinders are, as will be seen from Fig. 80, cast separately and are 4 in. bore by  $4\frac{1}{2}$  in. stroke; the valves are located on opposite sides; the valve tappets have a steel ball inserted in their lower ends to take the contact with the cams; means are also provided for regulating the lift. The carburettor is of the automatic type, provision being also provided that as the throttle is opened or closed the air inlet is proportionately regulated. A neat arrangement of the inlet pipes has been adopted to allow the mixture an equal distance to travel from the carburettor to each cylinder. The ignition

Fig. 80.—Sectional elevation of the new Standard six-cylinder engine.

is by high tension magneto and coil and accumulators, a special form of high tension distributor being provided. Contained with the latter is an ingenious lubricator for the oiling of the low tension contact maker. The lubrication is operated by a pump which sprays the oil on to the moving parts. A feature of the motor, which is carried on a sub-frame, are the large inspection doors provided in the base chamber. The clutch is of the single disc metal-to-metal type running in oil, provision being made to regulate the pedal pressure. The four-speed gear-box is controlled by a lever working in a "gate," a feature being that the direct drive is on the third speed, the fourth being indirect. The rear live axle has been re-designed; the sleeve carries the weight of the car, the power been transmitted to the hubs by the squared ends of the inside shafts. Inspection doors are provided to both the bevel wheels. The brakes are all provided with means of adjustment without the use of tools, while ball bearings are used throughout except on the engine. The 50-h.p. six-cylinder car is on similar lines; the engine, the bore and stroke of which is  $5\frac{1}{2}$  in. by 5 in., is, however, supported directly on the main frame. The chassis are adapted to receive any form of carriage body, the 30-h.p. with a seven-seated Berline being a noteworthy vehicle. A new Miniature Standard two-seated car was shown in an unfinished state; this is provided with a 10-h.p. four-cylinder air-cooled engine, driving through a three-speed gear-box and a cardan shaft on to the live axle.

**The Metallurgique Cars.**

Reference has already been made to the 24-28-h.p. vehicle exhibited by METALLURGIQUE CARS; this company also displayed examples of the 16-20-h.p. and 30-35-h.p. Metallurgique cars and a 60-h.p. chassis, the latter being one of the most noteworthy vehicles in the Show. The four-cylinder engine, the crankshaft of which is *desaxe*, has the inlet valves arranged in the cylinder heads, they being mechanically operated by push rods from a single cam shaft. Two high-tension ignitions are provided. The carburettor is of the automatic variety, the extra inlet valve being provided with a glycerine dashpot in place of the usual spring control

The clutch is of the expanding metal-to-metal type, and a new device consists of a locking bolt which, by pressing an extra foot lever, locks the two parts of the clutch together, thus preventing any slip when climbing hills. The gear-box is adapted to give four forward speeds, the final transmission being by a cardan shaft, spring drive, and bevel gear to a live axle. Three brake systems are provided—a pedal applying a brake on the differential, while a second pedal and a side lever actuate expanding and contracting brakes on drums connected with the rear wheel hub rings.

#### The Ford and S.C.A.R. Cars.

The CENTRAL MOTOR CAR CO., LTD., exhibited examples of the Ford 15-h.p. four-cylinder two-seated car and the S.C.A.R. 18-20-h.p. vehicles. As both of these have already been described in the *M.C.J.*, it is unnecessary to refer to them at any length. The last-named vehicle is of French construction, and made its first public appearance in this country in the 1906 Tourist Trophy race. The design follows the usual lines of live-axle cars; the engine has separately cast cylinders with the valves arranged on opposite sides. The radiator is provided with a fan, driven by bevel gearing off the crank shaft, which is of the built-up type.

through the fourth cylinder and successively through the others, and then into the radiator, the number of pipes being thus reduced to a minimum.

#### The Gobron-Brillie Cars.

The GOBRON-BRILLIE BRITISH MOTOR CO., LTD., exhibited a 40-60-h.p. Gobron-Brillie chassis, in which the well-known engine, with its four cylinders and eight pistons, is still retained; the valves are all operated off a single cam shaft, and the ignition is by high-tension magneto. The clutch is of a duplex type, a central one, metal-to-metal, engaging slightly in advance of the main leather-faced cone, so that the load is taken up without shock. The change-speed gear is now controlled by a lever working in a "gate," the final drive being by side chains. Two brakes are now provided on the differential shaft in addition to the usual hand-operated brakes on the rear road wheels. The complete cars on view included a highly-finished 40-60-h.p. limousine, with seating accommodation for seven.

#### The Lindsay Cars.

A neat design of 12-h.p. four-seated car was shown by the LINDSAY MOTOR CAR COMPANY. It is made to accommodate either three or four persons. The engine is a four-cylinder Fafnir, with a variable

Fig. 81.—The Ford 15-h.p. Four-Cylinder Car.

#### The Whitlock-Aster Cars.

The exhibit of the WHITLOCK AUTOMOBILE CO., LTD., comprised three Whitlock-Aster cars, one being fitted with the latest type of 12-14-h.p. Aster four-cylinder engine, with a cardan-shaft drive and a landaulet body. The other two models were both of 18-22-h.p. with four-cylinder engine, duplicate ignitions, ball bearings throughout and chain transmission. One was a double landaulet and the other an open-side entrance touring car, with seating accommodation for seven. Another exhibit of interest was a doctor's coupé, which may be fitted to any make of chassis, the arrangement being such that the driving is done from the interior.

#### The Panhard Cars.

A range of Panhard cars was exhibited by Messrs. PANHARD AND LEVASSOR, ranging from an 8-11-h.p. three-cylinder landaulet to a 24-h.p. limousine. In all the armoured wood frame is still retained, and the only alteration in the first-named vehicle is a slight change in the shape of the radiator. The 15-20-h.p. car is now being provided with push pedals in place of those of the press down variety. A new 18-h.p. model is being brought out for next year but was not shown. In this car, as also in the 24-h.p. type, the magneto and the water circulating pump are gear driven off the same shaft. The water is first made to pass

lift on the inlet valves. The mixture is furnished by a Longuemare carburettor, and the ignition is by coil and accumulators. Cooling is effected by means of a gear-driven pump and tubular radiator with fan, and the drive is through a leather-covered cone clutch to the three-speed gear-box, and thence by cardan shaft to a live axle. All the gears run on ball bearings. A 28-35-h.p. car was also shown. This is fitted with an Antoine engine, the four cylinders of which are 112 mm. bore by 129 mm. stroke. The valves, which are all on one side of the engine, are mechanically operated and interchangeable. Dual ignition, by accumulator and high tension magneto, is fitted. The carburettor is entirely automatic, and has no valve, while an oscillating pump, driven by the engine, supplies the principal bearings with lubricating oil. The clutch is of the leather-faced cone type, and the gear-box gives three speeds and reverse. The standard type of transmission is by cardan shaft and live axle, a noticeable feature being the provision of cast radius rods of triangular design.

#### The Radia Cars.

Two models of the Radia cars were shown by the ADRIA MOTOR AGENCY, LTD., one of 18-22-h.p. and the other of 30-35-h.p. The vehicles are both on similar lines, and are built in France, where their

excellent performance in various reliability contests has won them many friends. The engine has the cylinders cast in pairs; ignition is by low tension magneto, and the carburettor of a special automatic type. The clutch, which is of the cone type, is provided with a locking device, which prevents any slipping. The transmission is through a four speed gear-box with "gate" control to the differential shaft, which is connected with the rear road wheels by side chains. Throughout the cars are on up-to-date lines, the fan behind the radiator being supplemented by one combined with the flywheel. Double brakes, too, are provided on the differential shaft, in addition to those acting on drums attached to the rear road wheels.

#### The Lutece Car.

Messrs. TESTE AND LASSEN were disappointed in not being able to display a chassis of a new French car, known as the "Lutece," they are introducing into this country. The vehicle is of the live axle variety, and is fitted with a four-cylinder engine of 14-h.p. This firm exhibited one of the 1907 models of 24-h.p. Panhard cars, equipped with a highly-finished limousine body.

#### The Brooke Cars.

Like that of Messrs. S. F. EDGE, Ltd., the exhibit of Messrs. J. W. BROOKE AND CO., LTD., was entirely confined to six-cylinder cars. Only one size is being made, this being rated at 30-h.p. The cylinders, which are cast in pairs, are 92 mm. bore by 120 mm. stroke, the valves being arranged on opposite sides. The ignition is by high-tension magnet. The carburettor is of the automatic air-regulating variety, the inlet pipe being so arranged that the mixture has an equal distance to travel

the tank opens a port admitting oil to each bearing in turn. The speed of the engine is controlled by a hand lever and also by a pedal, which are connected up to a variable lift mechanism on the inlet valves, and to the contact maker. The change-speed gear is also of a special type, the pinions being brought into mesh by an eccentric movement. Three speeds forward and a reverse are controlled by a single lever, which operates any gear at will, and is interlocked with the clutch, so that the gear cannot be changed without declutching. The clutch is of the multiple disc type, and is contained in the gear case. From the engine a single chain transmits the power to the gear-box placed transversely beneath the main frame, the final drive being by another single chain to the live rear axle.

#### The James and Browne Cars.

Hitherto confining their attention to cars with horizontal engines, Messrs. JAMES AND BROWNE, LTD., have at last brought out a 30-40-h.p. six-cylinder vehicle with vertical engine, which they have named the "J. and B. Vertex." The cylinders, which are 4 in. bore by 5 in. stroke, are separately cast, and have the valves arranged on opposite sides. Two throttles are provided in connection with the automatic carburettor, one being operated by the governor, which is connected up to an accelerator pedal, and the other by a hand lever. The water-circulating pump runs at the same speed as the crankshaft, and has a spring device which would break the driving connection should there be any obstruction in the pump itself. The ignition is by a single coil and a synchronised high-tension distributor, the latter being placed behind the dashboard and operated by a vertical

Fig. 82.—Chassis of the Brooke 25-h.p. Six-Cylinder Car.

to each cylinder. Both foot and hand control of the engine speed is provided. The clutch is of the Bradley flat-plate type, 18 plates being employed; the gear-box is adapted to give four speeds and a reverse controlled by a lever working in a "gate," a feature being that the direct drive is on the third speed, the fourth speed being indirect. The transmission is by a cardan shaft to a live axle, which has only to withstand the driving strain, the weight of the car being carried on the sleeve, which is composed of large solid-drawn tubes, tapered in section and flanged to the differential casing, the latter being of malleable steel. The power is transmitted to the hubs of the rear wheels by dog-clutches on the axle ends. Altogether the design and construction is throughout of the highest order, and we look to the new vehicle taking a high place among British-built vehicles. The complete cars on view included a five-seated side-entrance double phaeton and a seven-seated double landaulet. The Brooke vehicles are of British construction throughout.

#### The Pilgrim Cars.

The new Pilgrim cars exhibited by the PILGRIM'S WAY MOTOR COMPANY, LTD., are of an exceedingly novel design and radically different to what may be termed standard practice. The exhibit comprised a two-seated car and a landaulet. The engine, which is mounted in the centre of the frame, comprises four horizontal cylinders all located on the same side of the crank shaft. The cylinders, which are 4½ in. bore by 5 in. stroke, are cast separately but complete with water jacket. The water circulation is on the thermo-siphon system, no pump being used. The standard ignition is by accumulator coil and distributor, the latter being mounted on the motor. The inlet valves are of the auto-mechanical type. The lubrication is on a novel system; a pressure pump is used to maintain a reservoir charged with oil. A rotary valve within

shaft and bevel gear on the inlet camshaft. The clutch is of the metal-to-metal internal cone type, running constantly in oil. The change-gear box, which is controlled by a lever working in a "gate," is suspended from the main frame from three points, and in such a way that the box can be detached in a very few minutes. The final transmission is by side chains. The chassis, which is supported on five springs, has a wheel base of 11 ft. 8 in. A 30-40-h.p. six-cylinder car fitted with one of the most luxuriously finished bodies in the Show was also to be seen at this stand. It consisted of a saloon and was built by the Lacre Company; the limousine top is detachable and is supplemented by a double-extension hood. Comfortable seating accommodation is provided for seven persons. The interior appointments include a glass-fronted cabinet, collapsible table, and an electric signal board in communication with the driver; in fact, scarcely any little detail has been omitted. Examples of the James and Browne 16-h.p. and 25-30-h.p. cars with horizontal engines were also on view.

#### The Globe Cars.

Two sizes of the Globe cars—12-14-h.p. and 22-25-h.p.—were shown by the HITCHON GEAR AND AUTOMOBILE COMPANY. The frame of these vehicles is of a special inverted U section of steel; the engines of both are of the four-cylinder type, and the transmission is now by bevel gear on to a live axle in place of the worm drive formerly employed. The change-speed gear is of the Hitchon patent type, in which the pinions run on free wheel clutches and are arranged that at the instant of changing gear the next higher or lower speed gear wheels must be in mesh before the other pair become disengaged. The universal joints and steering gear employed on these cars are also of noteworthy design.

### The N.E.C. Cars.

Few cars in the exhibition showed such originality in design as did those of the NEW ENGINE COMPANY, of Acton Hill, W., and although at first sight the fact that the mechanism is entirely hidden from view may lead some to think that it is difficult of access, a perusal of the following descriptions in conjunction with the illustrations will show that, far from this being the case, the arrangement is such that all the different parts of the engine and gear can be got at with a minimum of trouble and without having to get under the car. Two sizes are being built—15-h.p. two cylinders and four speeds, and 30-h.p. four-cylinder, the latter being made with either two or four speeds. Except as regards the number of cylinders the arrangement of the two vehicles is practically the same, so that the following particulars may be taken as applying to

Fig. 83.—The N.E.C. Car with Hood and Front Glass.
